Ovonic nickel-metal hydride (NiMH) rechargeable batteries are easily adaptable to a variety of applications. Small consumer NiMH cells were developed and are now being manufactured by licensees throughout the world. This technology was successfully scaled up in larger prismatic cells aimed at electric vehicle applications. Sealed cells aimed at satellite power applications were also built and cycle tested by OBC and other outside agencies. Prototype batteries with high specific energy (over 80 Wh/kg), high energy density (245 Wh/L), and excellent power capability (400 W/kg) were produced. Ovonic NiMH batteries demonstrated an excellent cycle life of over 10,000 cycles at 30 percent DOD. Presently, Ovonic Battery Company is working on an advanced version of this battery for space applications as part of an SBIR contract from NASA. Author (revised)

Avail: CASI HC A03/MF A03

Since 1990, there has been an ongoing collaboration among the authors in the three laboratories to (1) prepare alloys of the AB(sub 5) and AB(sub 2) types, using arc-melting/annealing and mechanical alloying/annealing techniques; (2) examine their physico-chemical characteristics (morphology, composition); (3) determine the hydrogen absorption/desorption behavior (pressure-composition isotherms as a function of temperature); and (4) evaluate their performance characteristics as hydride electrodes (charge/discharge, capacity retention, cycle life, high rate capability). The work carried out on representative AB(sub 5) and AB(sub 2) type modified alloys (by partial substitution or with small additives of other elements) is presented. The purpose of the modification was to optimize the thermodynamics and kinetics of the hydriding/dehydriding reactions and enhance the stabilities of the alloys for the desired battery applications. The results of our collaboration, to date, demonstrate that (1) alloys prepared by arc melting/annealing and mechanical alloying/annealing techniques exhibit similar morphology, composition and hydriding/dehydriding characteristics; (2) alloys with the appropriate small amounts of substituent or additive elements: (1) retain the single phase structure, (2) improve the hydriding/dehydriding reactions for the battery applications, and (3) enhance the stability in the battery environment; and (3) the AB(sub 2) type alloys exhibit higher energy densities than the AB(sub 5) type alloys but the state-of-the-art, commercialized batteries are predominantly manufactured using Ab(sub 5) type alloys. STATUS OF THE DEVELOPMENT OF RECHARGEABLE LITHIUM CELLS
G. Halpert, S. Surampudi, D. Shen, C-K. Huang, S. Narayanan, E. Vamos, and D. Perrone *In* NASA. Lewis Research Center, Space Electrochemical Research and Technology Nov. 1993 p 85-95 (For primary document see N94-23345 06-44)
Avail: CASI HC A03/MF A03

The progress in the development of the ambient temperature lithium - titanium disulfide rechargeable cell under development at the Jet Propulsion Laboratory is described in this paper. Originally aimed at achieving a specific energy of 100 Wh/kg, 'AA' cells have demonstrated 125 Wh/kg at the C/3 discharge rate. The results of evaluating cell design parameters are discussed and cycling test data are also included in the paper. Safety tests results at various over-charge and over discharge conditions and rates proved to be uneventful. The test results of cell with built-in overcharge mechanism proved the concept was feasible. Replacing the lithium foil electrode with a Li(x)C resulted in a capacity at 1mA/cm(exp 2) of 200 mAh/gm and 235 mAh/gm at 0.167 mA. Author (revised)

IMPEDANCE MEASUREMENTS ON A SPIRAL-WOUND NICKEL/METAL HYDRIDE CELL CYCLED IN A SIMULATED LEO ORBIT
Margaret A. Reid *In its* Space Electrochemical Research and Technology Nov. 1993 p 97-108 (For primary document see N94-23345 06-44)
Avail: CASI HC A03/MF A03

A spiral-wound size C cell was cycled at 25 C in a low earth orbit (LEO) regime at 50 percent depth of discharge (DOD) with approximately five percent over-charge. The nominal capacity was 3.5 AH. The cell was cycled for 2000 cycles. Capacity checks and impedance measurements over the complete range of state of charge were made upon receipt and after 500, 1000, and 2000 cycles. The capacity of the cell was essentially unchanged until after the impedance measurements at 2000 cycles. Only small changes in the impedance parameters were observed, but there was somewhat more scatter in the data after 2000 cycles. When the cell was returned to LEO cycling after 2000 cycles, only 38 percent of the capacity could be obtained. It is believed that the cell failed because of an equipment failure at the end of the final impedance measurements which allowed an over-discharge. Author (revised)

NASA LEWIS ADVANCED IPV NICKEL-HYDROGEN TECHNOLOGY
John J. Smithrick and Doris L. Britton *In its* Space Electrochemical Research and Technology Nov. 1993 p 109-125 (For primary document see N94-23345 06-44)
Avail: CASI HC A03/MF A03

Individual pressure vessel (IPV) nickel-hydrogen technology was advanced at NASA Lewis and under Lewis contracts. Some of the advancements are as follows: to use 26 percent potassium hydroxide electrolyte to improve cycle life and performance, to modify the state of the art cell design to eliminate identified failure modes and further improve cycle life, and to develop a lightweight nickel electrode to reduce battery mass, hence reduce launch and/or increase satellite payload. A breakthrough in the LEO cycle life of individual pressure vessel nickel-hydrogen battery cells was reported. The cycle life of boiler plate cells containing 26 percent KOH electrolyte was about 40,000 accelerated LEO cycles at 80 percent DOD compared to 3,500 cycles for cells containing 31 percent KOH. Results of the boiler plate cell tests have been validated at NWSC, Crane, Indiana. Forty-eight ampere-hour flight cells containing 26 and 31 percent KOH have undergone real time LEO cycle life testing at an 80 percent DOD, 10 C. The three cells containing 26 percent KOH failed on the average at cycle 19,500. The three cells containing 31 percent KOH failed on the average at cycle 6,400. Validation testing of NASA Lewis 125 Ah advanced design IPV nickel-hydrogen flight cells is also being conducted at NWSC, Crane, Indiana under a NASA Lewis contract. This consists of characterization, storage, and cycle life testing. There was no capacity degradation after 52 days of storage with the cells in the discharged state, on open circuit, 0 C, and a hydrogen pressure of 14.5 psia. The catalyzed wall wick cells have been cycled for over 22,694 cycles with no cell failures in the continuing test. All three of the non-catalyzed wall wick cells failed (cycles 9,588; 13,900; and 20,575). Cycle life test results of the Fibrex nickel electrode has demonstrated the feasibility of an improved nickel electrode giving a higher specific energy nickel-hydrogen cell. A nickel-hydrogen boiler plate cell using an 80 mil thick, 90 percent porous Fibrex nickel electrode has been cycled for 10,000 cycles at 40 percent DOD. Derived from text

PRIMARY AND SECONDARY ELECTRICAL SPACE POWER BASED ON ADVANCED PEM SYSTEMS
N. E. Vanderborgh, J. C. Hedstrom, K. R. Stroh, and J. R. Huff (Ballard Power Corp., Albuquerque, NM.) *In* NASA. Lewis Research Center, Space Electrochemical Research and Technology Nov. 1993 p 129-137 See also N94-14689 (For primary document see N94-23345 06-44)
Avail: CASI HC A02/MF A03

For new space ventures, power continues to be a pacing function for mission planning and experiment endurance. Although electrochemical power is a well demonstrated space power technology, current hardware limitations impact future mission viability. In order to document and augment electrochemical technology, a series of experiments for the National Aeronautics and Space Administration Lewis Research Center (NASA LeRC) are underway at the Los Alamos National Laboratory that define operational parameters on contemporary proton exchange membrane (PEM) hardware operating with hydrogen and oxygen reactants. Because of the high efficiency possible for water electrolysis, this hardware is also thought part of a secondary battery design built around stored reactants - the so-called regenerative fuel cell. An overview of stack testing at Los Alamos and of analyses related to regenerative fuel cell systems are provided in this paper. Finally, this paper describes work looking at innovative concepts that remove complexity from stack hardware with the specific intent of higher system reliability. This new concept offers the potential for unprecedented electrochemical power system energy densities.

Avail: CASI HC A02/MF A03

This paper will update the progress in developing electrocatalyst systems and electrode structures primarily for the positive electrode of single-unit solid polymer proton exchange membrane (PEM) regenerative fuel cells. The work was done with DuPont Nafion 117 in complete fuel cells (40 sq cm electrodes). The cells were operated alternately in fuel cell mode and electrolysis mode at 80 C. In fuel cell mode, humidified hydrogen and oxygen were supplied at 207 kPa (30 psi); in electrolysis mode, water was pumped over the positive electrode and the gases were evolved at ambient pressure. Cycling data will be presented for Pt-Ir catalysts and limited bifunctional data will be presented for Pt, Ir, Ru, Rh, and Na(x)Pt3O4 catalysts as well as for electrode structure variations. Avail: CASI HC A03/MF A03

Proton exchange membrane (PEM) fuel cells use a perfluorosulfonic acid solid polymer film as an electrolyte which simplifies water and electrolyte management. Their thin electrolyte layers give efficient systems of low weight, and their materials of construction show extremely long laboratory lifetimes. Their high reliability and their suitability for use in a microgravity environment makes them particularly attractive as a substitute for batteries in satellites utilizing high-power, high energy-density electrochemical energy storage systems. In this investigation, the Dow experimental PEM (XUS-13204.10) and unsupported high platinum loading electrodes yielded very high power densities, of the order of 2.5 W cm(exp -2). A platinum black loading of 5 mg per cm(exp 2) was found to be optimum. On extending the three-dimensional reaction zone of fuel cell electrodes by impregnating solid polymer electrolyte into the electrode structures, Nafion was found to give better performance than the Dow experimental PEM. The depth of penetration of the solid polymer electrolyte into electrode structures was 50-70 percent of the thickness of the platinum-catalyzed active layer. However, the degree of platinum utilization was only 16.6 percent and the roughness factor of a typical electrode was 274. Author (revised)

THE ELECTROLYTE CHALLENGE FOR A DIRECT METHANOL-AIR POLYMER ELECTROLYTE FUEL CELL OPERATING AT TEMPERATURES UP TO 200 C
Robert Savinell, Ernest Yeager, Donald Tryk, Uziel Landau, Jesse Wainright, Dominic Gervasio, Boris Cahan, Morton Litt, Charles Rogers, and Daniel Scherson *In* NASA. Lewis Research Center, Space Electrochemical Reseearch and Technology Nov. 1993 p 167-179 (For primary document see N94-23345 06-44)
(Contract N00014-92-J-1848)
Avail: CASI HC A03/MF A03

Novel polymer electrolytes are being evaluated for use in a direct methanol-air fuel cell operating at temperatures in excess of 100 C. The evaluation includes tests of thermal stability, ionic conductivity, and vapor transport characteristics. The preliminary results obtained to date indicate that a high temperature polymer electrolyte fuel cell is feasible. For example, Nafion 117 when equilibrated with phosphoric acid has a conductivity of at least 0.4 Omega(exp -1)cm(exp -1) at temperatures up to 200 C in the presence of 400 torr of water vapor and methanol vapor cross over equivalent to 1 mA/cm(exp 2) under a one atmosphere methanol pressure differential at 135 C. Novel polymers are also showing similar encouraging results. The flexibility to modify and optimize the properties by custom synthesis of these novel polymers presents an exciting opportunity to develop an efficient and compact methanol fuel cell. Avail: CASI HC A03/MF A03

Fuel cells that can operate directly on fuels such as methanol are attractive for low to medium power applications in view of their low weight and volume relative to other power sources. A liquid feed direct methanol fuel cell has been developed based on a proton exchange membrane electrolyte and Pt/Ru and Pt catalyzed fuel and air/O2 electrodes, respectively. The cell has been shown to deliver significant power outputs at temperatures of 60 to 90 C. The cell voltage is near 0.5 V at 300 mA/cm(exp 2) current density and an operating temperature of 90 C. A deterrent to performance appears to be methanol crossover through the membrane to the oxygen electrode. Further improvements in performance appear possible by minimizing the methanol crossover rate. Author (revised)

An alternative to a secondary battery as the power source for vehicle propulsion is a fuel cell. An example of this is the metal-air fuel cell using metals such as aluminum, zinc, or iron. Aluminum is a particularly attractive candidate, having high energy and power densities, being environmentally acceptable, and having a large, established industrial base for production and distribution. An aluminum-oxygen system is currently under development for a UUV test vehicle, and recent work has focussed upon low corrosion aluminum alloys and an electrolyte management system for processing the by-products of the energy-producing reactions. This paper summarizes the progress made in both areas. Anode materials capable of providing high utilization factors over current densities ranging from S to 150 mA/sq cm have been identified. These materials are essential to realizing an acceptable mission life for the UUV. With respect to the electrolyte management system, a filter/precipitator unit has been successfully operated for over 250 hours in a large scale, half-cell system. Author (revised)

Avail: CASI HC A03/MF A03

We have recently envisioned a process wherein fibers of various metals in the 0.5 to 15 micron diameter range are slurried in concert with cellulose fibers and various other materials in the form of particulates and/or fibers. The resulting slurry is cast via a wet-lay process into a sheet and dried to produce a free-standing sheet of 'composite paper.' When the 'preform' sheet is sintered in hydrogen, the bulk of the cellulose is removed with the secondary fibers and/or particulates being entrapped by the sinter-locked network provided by the metal fibers. The resulting material is unique, in that it allows the intimate contacting and combination of heretofore mutually exclusive materials and properties. Moreover, due to the ease of paper manufacture and processing, the resulting materials are relatively inexpensive and can be fabricated into a wide range of three-dimensional structures. Also, because cellulose is both a binder and a pore-former, structures combining high levels of active surface area and high void volume (i.e., low pressure drop) can be prepared as freestanding flow through monoliths. LIMITING FACTORS FOR CARBON BASED CHEMICAL DOUBLE LAYER CAPACITORS

M. Frank Rose, C. Johnson, T. Owens, and B. Stevens *In* NASA. Lewis Research Center, Space Electrochemical Research and Technology Nov. 1993 p 231-241 (For primary document see N94-23345 06-44)
(Contract DNA001-91-C-0127)
Avail: CASI HC A03/MF A03

The Chemical Double Layer (CDL) capacitor improves energy storage density dramatically when compared with conventional electrolytic capacitors. When compared to batteries, the CDL Capacitor is much less energy dense; however, the power density is orders of magnitude better. As a result, CDL-battery combinations present an interesting pulse power system with many potential applications. Due to the nature of the CDL it is inherently a low voltage device. The applications of the CDL can be tailored to auxiliary energy and burst mode storages which require fast charge/discharge cycles. Typical of the applications envisioned are power system backup, directed energy weapons concepts, electric automobiles, and electric actuators. In this paper, we will discuss some of the general characteristics of carbon-based CDL technology describing the structure, performance parameters, and methods of construction. Further, analytical and experimental results which define the state of the art are presented and described in terms of impact on applications. Author (revised)

A HIGH PERFORMANCE H2-Cl2 FUEL CELL FOR SPACE POWER APPLICATIONS

Everett B. Anderson, E. Jennings Taylor, Gerald Wilemski, and Alan Gelb *In* NASA. Lewis Research Center, Space Electrochemical Research and Technology Nov. 1993 p 243-250 (For primary document see N94-23345 06-44)
Avail: CASI HC A02/MF A03

NASA has numerous airborne/spaceborne applications for which high power and energy density power sources are needed. The proton exchange membrane fuel cell (PEMFC) is an attractive candidate for such a power source. PEMFC's offer many advantages for airborne/spaceborne applications. They have high power and energy densities, convert fuel to electrical power with high efficiency at both part and full load, and can rapidly startup and shutdown. In addition, PEMFC's are lightweight and operate silently. A significant impediment to the attainment of very high power and energy densities by PEMFC's is their current exclusive reliance on oxygen as the oxidant. Conventional PEMFC's oxidize hydrogen at the anode and reduce oxygen at the cathode. The electrode kinetics of oxygen reduction are known to be highly irreversible, incurring large overpotential losses. In addition, the modest open circuit potential of 1.2V for the H2-O2 fuel cell is unattainable due to mixed potential effects at the oxygen electrode. Because of the high overpotential losses, cells using H2 and O2 are capable of achieving high current densities only at very low cell voltages, greatly curtailing their power output. Based on experimental work on chlorine reduction in a gas diffusion electrode, we believe significant increases in both the energy and power densities of PEMFC systems can be achieved by employing chlorine as an alternative oxidant.

HAIRY CARBON ELECTRODES STUDIED BY CYCLIC VOLTAMMETRY AND BATTERY DISCHARGE TESTING

Deborah D. L. Chung, Xiaoping Shui, and Christine A. Frysz (Wilson Greatbatch Ltd., Clarence, NY.) *In* NASA. Lewis Research Center, Space Electrochemical Research and Technology Nov. 1993 p 251-257 (For primary document see N94-23345 06-44)
Avail: CASI HC A02/MF A03

Hairy carbon is a new material developed by growing submicron carbon filaments on conventional carbon substrates. Typical substrate materials include carbon black, graphite powder, carbon fibers, and glassy carbon. A catalyst is used to initiate hair growth with carbonaceous gases serving as the carbon source. To study the electrochemical behavior of hairy carbons, cyclic voltammetry (CV) and discharge testing were conducted. In both cases, hairy carbon results surpassed those of the substrate material alone. Author

From March 31 - April 1, 1993, Sandia National Laboratories (SNL) and the National Renewable Energy Laboratory (NREL) hosted a workshop entitled 'Fatigue Life Methodologies.' The purpose of this workshop was to bring together a representative panel of experts to discuss the prediction and measurement of infrequent events that contribute significantly to the damage of wind turbine components. The diverse backgrounds of the participants yielded discussions that covered a wide range of research and design activities from many varying viewpoints. Consensus was not reached on most of the questions raised at the workshop; however, the workshop laid the foundation for a program that now knows what questions must be answered. DOE

CONTROL ALGORITHMS FOR EFFECTIVE OPERATION OF VARIABLE-SPEED WIND TURBINES

Oct. 1993 45 p
(Contract DE-AC04-94AL-85000)
(DE94-002607; SAND-90-7112) Avail: CASI HC A03/MF A01

This report describes a computer code, called ASYM, and provides results from its application in simulating the control of the 34-m Test Bed vertical-axis wind turbine (VAWT) in Bushland, Texas. The code synthesizes dynamic wind speeds on a second-by-second basis in the time domain. The wind speeds conform to a predetermined spectral content governed by the hourly average wind speed that prevails at each hour of the simulation. The hourly average values are selected in a probabilistic sense through the application of Markov chains, but their cumulative frequency of occurrence conforms to a Rayleigh distribution that is governed by the mean annual wind speed of the site selected. The simulated wind speeds then drive a series of control algorithms that enable the code to predict key operational parameters such as number of annual starts and stops, annual energy production, and annual fatigue damage at a critically stressed joint on the wind turbine. This report also presents results from the application of ASYM that pertain to low wind speed cut-in and cut-out conditions and controlled operation near critical speed ranges that excite structural vibrations that can lead to accelerated fatigue damage. OVERVIEW OF MOLTEN CARBONATE FUEL CELL TECHNOLOGY DEVELOPMENT

M. C. Williams, E. L. Parsons, Jr., and M. J. Mayfield 1993 9 p Presented at the 28th Intersociety Energy Conversion Engineering Conference, Atlanta, GA, 8-13 Aug. 1993
(DE94-001911; DOE/METC-C/94/7110; CONF-930804-21) Avail: CASI HC A02/MF A01

The molten carbonate fuel cell (MCFC) has been identified as a promising energy conversion product for development and commercialization. Overall DOE MCFC program goal is to develop and commercialize low-cost, simple fuel cell systems. Objective of the MCFC program is to develop and demonstrate MCFC power plant systems. Significant progress has already been made in developing the MCFC technology in the U.S. Manufacturing and test facility development and testing by the MCFC developers has also been significant. Product improvement issues need to be resolved to vector the MCFC technology from its current status to a multi-fuel, integrated, simple, low-cost, modular, market-responsive power plant product. MCFC's must undergo continuing product refinement to ensure that durability and cost reduction through modularization and stack manufacturing scale-up occurs. MCFC developers need to continue to be responsive to end-users in potential markets. MCFC's appear to have a place in a decentralized power industry future. Natural gas availability appears to play a key role in MCFC commercialization. DOE

CONTAMINANT EFFECTS IN SOLID OXIDE FUEL CELLS

E. R. Ray and N. J. Maskalick 1993 12 p Presented at the Joint Contractors Meeting on Advanced Turbine Systems, Fuel Cells and Coal-Fired Heat, Morgantown, WV, 3-5 Aug. 1993
(Contract DE-AC21-89MC-26355)
(DE94-002963; DOE/MC-26355/94/C0254; CONF-930893-16) Avail: CASI HC A03/MF A01

Ammonia impurity up to 5000 ppM in simulated coal gas does not contribute much to SOFC voltage degradation (1000 C, 350 mA/sq cm) over 6500 h (as testing time increases, this effect is expected to be nil). HCl impurity in coal gas at 1 ppM does not have a detectable effect on SOFC performance up to 6500 h. H_2S impurity at 0.1 ppM in coal gas can be tolerated by state of the art SOFC's, along with 5000 ppM ammonia and 1 ppM HCl, over at least 5000 h. Silica impurity in coal gas can be carried over to the SOFC and deposited; this carryover is not enhanced by 56% H_2O in the fuel; silica is not expected to have a major effect on SOFC performance. Zinc vapor impurity in coal gas, as generated over heated ZnO, may be carried over to SOFC but not deposit; the carryover may be enhanced by HCl. DOE

A SOLAR PHOTOVOLTAIC POWER SYSTEM FOR USE IN ANTARCTICA

Lisa L. Kohout, Anthony Merolla (Sverdrup Technology, Inc., Brook Park, OH.), and Anthony Colozza (Sverdrup Technology, Inc., Brook Park, OH.) Dec. 1993 15 p
(Contract NAS3-25266; RTOP 199-52-82)
(NASA-TM-106417; E-8254; NAS 1.15:106417) Avail: CASI HC A03/MF A01

A solar photovoltaic power system was designed and built at the NASA Lewis Research Center as part of the NASA/NSF Antarctic Space Analog Program. The system was installed at a remote field camp at Lake Hoare in the Dry Valleys, and provided a six-person field team with electrical power for personal computers and printers, lab equipment, lighting, and a small microwave oven. The system consists of three silicon photovoltaic sub-arrays delivering a total of 1.5 kWe peak power, three lead-acid gel battery modules supplying 2.4 kWh, and an electrical distribution system which delivers 120 Vac and 12 Vdc to the user. The system was modularized for ease of deployment and operation. Previously the camp has been powered by diesel generators, which have proven to be both noisy and polluting. The NSF, in an effort to reduce their dependence on diesel fuel from both an environmental and cost standpoint, is interested in the use of alternate forms of energy, such as solar power. Such a power system also will provide NASA with important data on system level deployment and operation in a remote location by a minimally trained crew, as well as validate initial integration concepts. Author (revised)

CONSIDERATIONS IN IMPLEMENTING INTEGRATED BIOMASS ENERGY SYSTEMS IN DEVELOPING COUNTRIES

R. D. Perlack and J. W. Ranney 1993 6 p Presented at the 1st Biomass Conference of the Americas: Energy, Environment, Agriculture, and Industry, Burlington, VT, 30 Aug. - 2 Sep. 1993
(Contract DE-AC05-84OR-21400)
(DE93-018720; CONF-9308106-1) Avail: CASI HC A02/MF A01

In this paper, we discuss the issues and barriers associated with implementing integrated biomass energy systems in developing countries. An integrated biomass energy system is dependent on sustainably grown and managed energy crops, is supportive of rural development, is environmentally beneficial (locally and globally), is adapted to local conditions, takes advantage of by- and co-products, and uses conversion technologies that have been optimized for biomass. A preliminary evaluation of a biomass to electricity project relying on plantation grown feedstocks in rural Yunnan Province in Southwest China provided some financial/economic results, general conclusions, and an initial framework for conducting such assessments. Our assessment indicates that social and environmental benefits are substantial and that investment in the facility is well-justified. However, there are so many considerations to take into account when assessing biomass energy systems that their evaluation is exceedingly complex. These considerations are grouped into biomass production, biomass logistics and transport, and biomass conversion. Implementing such systems requires another grouping of considerations into energy and economics, institutional and social issues, and environmental issues. These are further defined in an effort to establish a framework of evaluation and assessment for other such projects. The conclusions that such a project would be viable in rural China is shadowed by many site-specific circumstances and highlights the need for systematic and integrated appraisal. DOE

THIN FILM CADMIUM TELLURIDE PHOTOVOLTAIC CELLS

C. D. Compaan (Toledo Univ., OH.) and R. G. Bohn (Toledo Univ., OH.) Oct. 1993 28 p
(Contract DE-AC02-83CH-10093)
(DE94-000201; NREL/TP-451-5813) Avail: CASI HC A03/MF A01

This report describes work to develop and optimize radio-frequency (RF) sputtering and laser-driven physical vapor deposition (LDPVD) for CdTe-based thin-film solar cells. Both of these techniques are vacuum-based and share several other common physical principles. However, they differ somewhat in the typical kinetic energies of Cd, Te, and S that impact on the growth surface. The values of several processing parameters-optimized with the LDPVD technique-were taken as starting values for the RF sputtering method. We completed an initial optimization of the sputtering parameters for the CdTe growth and also successfully sputtered CdS for the first time. In addition, we successfully fabricated what we believe are the first CdS/CdTe cells in which RF sputtering was used for both CdS and CdTe layers. We achieved an all-LDPVD cell with an air mass (AM) 1.5 efficiency of 10.5% and an all-RF-sputtered cell with AM 1.5 efficiency of 10.4%, as tested by NREL. DOE

OVERVIEW OF THE STATUS AND PROGRESS IN PHOTOVOLTAICS RESEARCH IN THE UNITED STATES

T. Surek 1993 7 p Presented at the International Solar Energy Society World Congress, Budapest, Hungary, 23-27 Aug. 1993
(Contract DE-AC02-83CH-10093)
(DE94-000981; CONF-930838-2) Avail: CASI HC A02/MF A01

Photovoltaics (PV) is a semiconductor technology that directly converts sunlight to electricity. Research over the past 20 years has resulted in the discovery of new PV materials, devices, and fabrication approaches: continuing improvements in the efficiency and reliability of solar cells and modules: and lower PV module and system costs. Along with improvements in the technology and manufacturing have come a large number of new, cost-effective uses, including international applications in mostly off-grid, remote locations, and various grid-connected and off-grid applications in the United States. This paper reviews the rapid progress from the laboratory to the marketplace in PV technology in the United States. DOE

RESULTS OF THE 1993 NASA/JPL BALLOON FLIGHT SOLAR CELL CALIBRATION PROGRAM

B. E. Anspaugh and R. S. Weiss 1 Oct. 1993 23 p
(NASA-CR-195158; JPL-PUBL-93-30; NAS 1.26:195158) Avail: CASI HC A03/MF A01

The 1993 solar cell calibration balloon flight was completed on July 29, 1993. All objectives of the flight program were met. Forty modules were carried to an altitude of 120,000 ft (36.6 km). Data telemetered from the modules was corrected to 28 C and to 1 AU. The calibrated cells have been returned to 8 participants and can now be used as reference standards in simulator testing of cells and arrays. Derived from text

SUPERCONDUCTING ENERGY STORAGE

R. F. Giese 1 Oct. 1993 82 p
(Contract W-31-109-eng-38)
(DE94-002248; ANL/ES/RP-81001) Avail: CASI HC A05/MF A01

This report describes the status of energy storage involving superconductors and assesses what impact the recently discovered ceramic superconductors may have on the design of these devices. Our description is intended for R&D managers in government, electric utilities, firms, and national laboratories who wish an overview of what has been done and what remains to be done. It is assumed that the reader is acquainted with superconductivity, but not an expert on the topics discussed here. Indeed, it is the author's aim to enable the reader to better understand the experts who may ask for the reader's attention, support, or funding. This report may also inform scientists and engineers who, though expert in related areas, wish to have an introduction to our topic. DOE

WISPER: WIRELESS SPACE POWER EXPERIMENT Final Report
Joseph Hawkins Jun. 1993 211 p
(Contract NASw-4435)
(NASA-CR-195538; NAS 1.26:195538) Avail: CASI HC A10/MF A03

The 1993 Advanced Design Project at the University of Alaska Fairbanks was to design a spacecraft as a technology demonstration of wireless power transmission (WPT). With cost effectiveness as a design constraint, a micro-satellite in low earth orbit (LEO) was chosen for the mission. Existing and near term technologies were analyzed and selected for the project. In addition to the conceptual design of the payload, support systems, and structure, the analysis included attention to safety, environmental impact, cost, and schedule for construction and operation. Wireless power beaming is not a new concept. Experimental demonstrations and study efforts have continued since the early 1960's. With the latest progress in transmitter and receiver technology, the next natural step is to beam power from earth to space. This proposed flight demonstration will advance the science of power beaming and prove the viability of various applications of WPT in space. Two methods of power beaming will be examined during the two separate phases of the spacecraft life. The first phase will demonstrate the technology and examine the theory of microwave power transmission at a high frequency. Special aspects of the first phase will include a highly accurate attitude control system and a 14 m inflatable parabolic antenna. The second phase will investigate the utilization of high intensity laser power using modified photovoltaic arrays. Special instrumentation on the spacecraft will measure the conversion efficiency from the received microwave or laser power to direct current power. Author

METAL HYDRIDE STORAGE [HYDRIDIVETYVARASTO]
Seppo Taehtinen Oct. 1992 33 p In FINNISH Sponsored by Ministry of Trade and Industry, Finland, and Technical Research Centre of Finland, Espoo
(VTT-JULK-769; ISBN-951-38-4117-0; ETN-94-95242) Copyright Avail: CASI HC A03/MF A01

The worldwide use of wind and solar energy as sources for heat and electricity is not a viable energy choice due to unavailability of an environmentally benign energy carrier which is also storable, transportable, and convertible. Hydrogen is an almost ideal energy carrier, and it is compatible with existing energy systems. In the long term, hydrogen is capable of replacing fossil energy sources. Metal hydrides react reversibly with hydrogen and are a compact and safe method to store hydrogen gas at ambient temperatures and pressures. The construction and testing of a metal hydride hydrogen storage vessel is reported. The storage capacity of the vessel was 1.6 cu m of hydrogen gas. Filling pressure was 5 bar at the temperature of 20 C. Release pressure depended on the temperature and varied between 2 to 40 bar as the storage temperature varied between 20 to 75 C. Reversibility of the storage vessel was 93 percent at a temperature of 20 C. ESA

THE HEXAGONAL COMPOUND PARABOLIC CONCENTRATOR DESIGN AND CONSTRUCTION
Walter E. C. Pritzkow Dec. 1990 32 p
(DLR-Mitt-93-03; ETN-94-95205) Avail: CASI HC A03/MF A01

The hexagonal compound parabolic concentrator, a secondary concentrator with a concentration ratio of three, is presented. This concentrator is designed for the Small Solar Power System Central Receiver System (SSPS-CRS) solar tower power plant to concentrate in a second stage the solar radiation gathered by the heliostat field. The flux distribution at the exit will be higher and more homogeneous. This concentrator is designed with a hexagonally shaped inlet contour to allow a modular design of secondary concentrators and windowed volumetric receivers. The modular design is needed because the receiver window size is limited due to manufacturing restrictions. ESA

THE PRESSURE LOADED VOLUMETRIC CERAMIC RECEIVER 500 kW VERSION DESIGN AND CONSTRUCTION
Walter E. C. Pritzkow Dec. 1990 35 p
(DLR-Mitt-93-02; ETN-94-95204) Avail: CASI HC A03/MF A01

The design of a Pressure Loaded Volumetric Ceramic Receiver (PLVCR), a solar receiver to convert concentrated solar radiation into process heat, is presented. The PLVCR has a domed quartz glass window, a segmented domed ceramic foam absorber, and was designed for a power level of 500 kW to heat up air from ambient to 1000C at pressures up to 10 bar. With a secondary concentrator located in front of the receiver the whole system was installed on the Small Solar Power System Central Receiver System (SSPS-CRS) tower. During first tests, air was heated up to 700C at pressures up to 3.6 bar, showing the function of a modular design of receiver and secondary concentrator. ESA

OVERVIEW OF GLOBAL GREENHOUSE EFFECTS
R. A. Reck 1993 12 p Presented at the 5th International Energy Conference, Seoul, Republic of Korea, 18-22 Oct. 1993
(Contract W-31-109-eng-38)
(DE93-041165; ANL/ER/CP-80457; CONF-9310173-1) Avail: CASI HC A03/MF A01

The factors that influence the evolution of climate and climate change are reviewed. Recent studies have confirmed that CO2, O3, N2O, CH4, and chlorofluorocarbons are increasing in abundance in the atmosphere and can alter the radiation balance by means of the so-called greenhouse effect. The greenhouse effect is a well-accepted phenomenon, but the prediction of its consequences is much less certain. Attempts to detect a human-caused temperature change are still inconclusive. A discussion of the scientific basis for the greenhouse effect, its relationship to the abundances of greenhouse gases, and the evidence confirming the increases in the abundances are presented. The basis for climate modeling is presented together with an example of the model outputs from one of the most sophisticated modeling efforts. Uncertainties in the present understanding of climate are outlined. DOE

NOAA FEDERAL/STATE COOPERATIVE PROGRAM IN ATMOSPHERIC MODIFICATION RESEARCH. COLLECTED PUBLICATION TITLES AND ABSTRACTS
R. F. Reinking Apr. 1993 92 p
(PB93-198125; NOAA-TM-ERL-WPL-231) Avail: CASI HC A05/MF A01

The volume contains the titles and abstracts of technical publications through fiscal year 1992 that are the products of the NOAA Federal/State Cooperative Program in Atmospheric Modification Research. The program is focused on the very interdisciplinary science of purposeful cloud modification for precipitation enhancement and hail suppression, and unintentional modification of clouds and precipitation. The audience includes, for example, water managers, policy makers, scientists, practitioners in the field, and the interested public. Listed are publications on topics including but not limited to: cloud and precipitation processes, numerical cloud and atmospheric mesoscale modeling, atmospheric and storm monitoring instrumentation and technologies, aerosol transport and dispersion in clouds and over complex terrain, cloud seeding technologies and effects, agricultural responses to cloud modification, weather economics and societal aspects of cloud modification, unintentional weather and climate modification, and precipitation and hydrological assessment and forecasting. US DEPARTMENT OF ENERGY PHASEOUT OF CFC-REFRIGERANTS
K. B. Miller, C. W. Purcell, M. H. Turner, and D. R. Conover Sep. 1993 13 p Presented at the International Specialty Conference on Control of Ozone Depleting Substances: Delivering the Montreal Protocol, Whistler, Ontario, 22-24 Sep. 1993 Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contract DE-AC06-76RL-01830)
(DE94-001668; PNL-SA-23021; CONF-9309137-1) Avail: Issuing Activity (Department of Energy (DOE))

DOE's goal is to phase out the use of Ozone Depleting Substances (ODS's) by implementing environmentally safe alternative substances and processes within a timeframe that is consistent with the requirements and spirit of Executive Order 12843 and Title 6 of the Clean Air Act. Refrigeration and air conditioning uses of CFC's present a challenge to DOE, as well as other industrial users of these applications, because of the limited number of approved CFC alternatives currently available. The estimated costs associated with retrofitting or replacing refrigerant equipment are high, and there is some concern over whether sufficient production capacity exists to meet the demand for equipment and retrofits from all consumers. On the other hand, there is also concern that DOE facilities and other users of CFC refrigerants may have difficulty obtaining sufficient quantities of these chemicals to service existing needs. To assist DOE facilities in planning for CFC phaseout, DOE Headquarters contracted with PNL to develop a Refrigerant Management Plan that uses a life-cycle cost analysis based on the equipment's remaining useful life. FEASIBILITY STUDY ON A CO2 GLOBAL RECYCLING SYSTEM USING NATURAL ENERGY
Mar. 1993 226 p In JAPANESE
(DE94-714889; NEDO-GET-9210-2) Avail: CASI HC A11/MF A03

A proposal was made to solve global environmental problems and energy problems simultaneously by combining treatment of a great amount of CO2 with transportation of new energies difficult of large-scale, long-distance transportation. This system uses solar cells to produce hydrogen, which is synthesized with recovered CO2 to produce CH3OH and transported to users by tankers. Solar energy is available several thousand times as much as the currently mineable fossil fuels (=10 TW), and can handle the worldwide demand even with solar cells of 10% efficiency that are installed covering 2% to 3% of the desert area. A problem is that the production site is located very far away from demand areas, for example, 10,000 km on average from Japan, and moreover across oceans. The CO2 recycling system has problems on energy balance and material balance. The energy balance is from -60% to -75%. Accordingly, the energy base was selected at 'window of the desert' (desert adjoining the seashore), and a new type CO2 tanker was proposed. CO2 causes a carbon deficiency because the CO2 purity is less than 90%. DOE

IN SITU DETECTION OF TROPOSPHERIC OH, HO2, NO2, AND NO BY LASER-INDUCED FLUORESCENCE IN DETECTION CHAMBERS AT REDUCED PRESSURES Semiannual Progress Report, 1 Apr. - 30 Sep. 1993
William H. Brune 26 Dec. 1993 36 p Submitted for publication
(Grant NAG1-1057)
(NASA-CR-194810; NAS 1.26:194810) Avail: CASI HC A03/MF A01

This report is a brief summary of the status of work on the grant entitled 'In situ detection of tropospheric OH, HO2, NO2, and NO by laser induced fluorescence in detection chambers at low pressures.' The basic instrument characteristics have been established, and have been reported in a manuscript, included as an appendix to this report, that has been accepted by the Journal of Geophysical Research. Currently, two efforts are under way. First, instrument tests and calibrations are continuing. These efforts include field measurements and an informal inter comparison in Colorado last August and September. Second, new technologies in lasers and detectors are being implemented to make the instrument smaller, lighter, and more energy efficient. Such instrument modifications are essential for measurements from aircraft, high scaffolding in forests, and ships. Derived from text

EXPLORATORY REPORT ANTIMONY AND ANTIMONY COMPOUNDS
W. Slooff, P. F. H. Bont (Resources Planning Consultants B.V., Delft, Netherlands.), J. M. Hesse, and B. Loos Oct. 1992 47 p
(PB93-224004; RIVM-710401020) Avail: CASI HC A03/MF A01

The report contains general information on antimony and antimony compounds concerning the existing standards, emissions, exposure levels, and effect levels. The document is to be considered as a start for the national discussion during an exploratory meeting on integrated criteria documents. Antimony is not produced in the Netherlands, but is found in various ores processed in the Netherlands. Antimony is applied as a fire retardant, in alloys and pigments, as a catalyst, and in light bulbs. Many antimony-emitting sources are known but the emission figures are often lacking. The most important known sources of emissions to air are light bulb production and pigment industry, and possibly the burning of fire retardants, whereas hunting, shooting, and sport fishing contribute significantly to emissions to soil and water. RADIATIVE FORCING CALCULATIONS FOR SF6 AND CH4 USING A CORRELATED k-DISTRIBUTION TRANSMISSION MODEL
A. S. Grossman, K. E. Grant, and D. J. Wuebbles 11 Aug. 1993 23 p
(Contract W-7405-eng-48)
(DE94-001855; UCRL-ID-115042) Avail: CASI HC A03/MF A01

A correlated k-distribution model for the atmospheric transmission of major molecular species has been used to calculate the tropospheric radiative forcing for the ground state, v(sub 3) band of SF6 and CH4. A mid-latitude summer, clear sky approximation, temperature-pressure distribution was used in the radiative transfer calculations. For the SF6 calculations a value of 0.26 W/m(exp 2) was obtained for the v(sub 3) band forcing using a new value of the measured integrated band absorption for SF6. The abundance used was 1 ppbv of SF6. Hot band contributions to the forcing are estimated to be on the order of three times the value of the v(sub 3) value giving a total radiative forcing of about 0.73 W/m(exp 2). For the CH4 calculation a value of 1.71 W/m(exp 2) was obtained and this number agrees with previously published CH4 radiative forcing values to within four percent. The radiative forcing calculation for SF6 is used to estimate the global warming potential (GWP) of SF6 using an approximate model developed to provide reasonably accurate GWP's. The results give GWP's for SF6 of the order of 12000-25000 (CO2 = 1). We estimate the likely range of the radiative forcing and GWP values based on two recent measurements of the total integrated band strength of SF6. Comparison of the GWP's of SF6 to those of CF4 (3600-8500) and CFC-11 (4500-1400) indicates that SF6 has the potential to be a major greenhouse gas if large amounts are introduced into the atmosphere. PERFORMANCE OF THE CARBON DIOXIDE INFORMATION ANALYSIS CENTER (CDIAC)
F. W. Stoss and S. B. Jones 1993 13 p Presented at the INFOTECH 1993 Conference, Oak Ridge, TN, 20-23 Oct. 1993
(Contract DE-AC05-84OR-21400)
(DE94-002190; CONF-9310145-2) Avail: CASI HC A03/MF A01

The Carbon Dioxide Information Analysis Center (CDIAC) provides information and data resources in support of the US Department of Energy's Global Change Research Program. CDIAC also serves as a resource of global change information for a broader international community of researchers, policymakers, managers, educators, and students. The number of requests for CDIAC's data products, information services, and publications has grown over the years and represents multidisciplinary interests in the physical, life, and social sciences and from diverse work settings in government, business, and academia. CDIAC's staff addresses thousands of requests yearly for data and information resources. In response to these requests, CDIAC has distributed tens of thousands of data products, technical reports, newsletters, and other information resources worldwide since 1982. This paper describes CDIAC, examines CDIAC's user community, and describes CDIAC's response to requests for information. The CDIAC Information System, which serves as a comprehensive PC-based inventory and information management tracking system, is also described. DOE

ESTIMATION OF DELAYS AND EMISSIONS AT FOUR-WAY JUNCTIONS WITH DIFFERENT FORMS OF REGULATION, PRINCIPALLY FOUR-WAY MANDATORY STOP [UPPSKATTNING AV FOERDROEJNING OCH AVGASUTSLAEPP IFYRVAEGSKORSNINGAR MED OLIKA REGLERINGSFORMER, SPECIELLT FYRVAEGSSTOPP]

P. Henriksson 1992 48 p In SWAHILI Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-105236; VTI/Meddelande-700) Avail: Issuing Activity (National Technical Information Service (NTIS))

The bulletin reports an estimation of emissions and delays at four-way junctions with different types of regulation: mandatory stop on two approaches, mandatory stop on four approaches, and traffic signals. Variables such as incoming traffic flow, traffic distribution on the primary and secondary road, and the proportion of turning vehicles have been varied. The delay at a junction with mandatory stop on all approaches has been estimated to be of the same order of size as the delay at a junction regulated by signals, i.e. up to twice as long as in the case of a mandatory stop on two approaches. Emissions are lowest at a junction with mandatory stop on two approaches. With traffic signals, emissions increase by 5-10% and with mandatory stop on all approaches the increase is 10-20%. The difference in emissions increases when either the proportion of turning vehicles decreases or the distribution of the traffic on the intersecting roads is uneven. NTIS

FUNDAMENTAL STUDY OF NO(x) CONTROL IN CATALYTIC COMBUSTION Annual Report, Jan. - Dec. 1992

S. K. Agarwal, B. W. Jang, M. Oecal (Pittsburgh Univ., PA.), A. Riley (Pittsburgh Univ., PA.), and G. Marcelin (Pittsburgh Univ., PA.) Jan. 1993 61 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract GRI-5092-260-2333)
(PB94-112323; GRI-93/0076) Avail: CASI HC A04

A series of La(1-x)Sr(x)CoO3 perovskite catalysts have been used to study the catalytic combustion of methane and the formation/destruction of NO(x). Addition of Sr to LaCoO3 increased the catalytic activity for methane combustion and NO(x) reduction. While the methane combustion activity exhibited an optimum with the Sr content in the catalyst, the NO(x) reduction activity increased linearly with the Sr amount. Catalyst characterization using TPR, TPOE, and SSITKA showed an increase in oxygen exchange and oxygen mobility with the Sr content. The results suggest that the NO(x) destruction activity is related to the catalyst oxygen mobility. Under catalytic combustion conditions, emissions of NO(x) are less than 3 ppm at temperatures up to 1100 C. NTIS

THE ATMOSPHERIC EFFECTS OF STRATOSPHERIC AIRCRAFT: A THIRD PROGRAM REPORT

Richard S. Stolarski, ed. and Howard L. Wesoky, ed. (National Aeronautics and Space Administration, Washington, DC.) Washington NASA Nov. 1993 405 p
(NASA-RP-1313; NAS 1.61:1313) Avail: CASI HC A18/MF A04

A third report from the Atmospheric Effects of Stratospheric Aircraft (AESA) component of NASA's High-Speed Research Program (HSRP) is presented. Market and technology considerations continue to provide an impetus for high-speed civil transport research. A recent United Nations Environment Program scientific assessment showed that considerable uncertainty still exists about the possible impact of aircraft on the atmosphere. The AESA was designed to develop the body of scientific knowledge necessary for the evaluation of the impact of stratospheric aircraft on the atmosphere. The first Program report presented the basic objectives and plans for AESA. This third report marks the midpoint of the program and presents the status of the ongoing research on the impact of stratospheric aircraft on the atmosphere as reported at the third annual AESA Program meeting in June 1993. The focus of the program is on predicted atmospheric changes resulting from projected HSCT emissions. Topics reported on cover how high-speed civil transports (HSCT) might affect stratospheric ozone, emissions scenarios and databases to assess potential atmospheric effects from HSCT's, calculated results from 2-D zonal mean models using emissions data, engine trace constituent measurements, and exhaust plume/aircraft wake vortex interactions.

ALTERNATIVE CONTROL TECHNIQUES DOCUMENT: NOx EMISSIONS FROM STATIONARY RECIPROCATING INTERNAL COMBUSTION ENGINES

Jul. 1993 317 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-104494; EPA/453/R-93/032) Avail: Issuing Activity (National Technical Information Service (NTIS))

The alternative control techniques (ACT) document describes available control techniques for reducing NOx emission levels from rich-burn and lean-burn natural gas-fired, diesel, and dual-fuel stationary reciprocating internal combustion engines. A discussion of the formation of NOx and uncontrolled emission levels is included. Control techniques include parameter adjustments, prestratified charge, selective and nonselective catalytic reduction, and low-emission combustion. Achievable controlled NOx emission levels, costs and cost effectiveness, and environmental impacts are presented, and the applicability of these control techniques to new equipment and retrofit applications is discussed. OZONE DEPLETION, PARADIGMS, AND POLITICS

Ronald L. Iman 1993 8 p Presented at the 1993 American Society for Quality Control/American Statistics Association Fall Meeting, Rochester, NY, 14-15 Oct. 1993
(Contract DE-AC04-94AL-85000)
(DE94-001600; SAND-93-1296C; CONF-9310203-1) Avail: CASI HC A02/MF A01

The destruction of the Earth's protective ozone layer is a prime environmental concern. Industry has responded to this environmental problem in the following ways: implementing conservation techniques to reduce the emission of ozone-depleting chemicals (ODC's); using alternative cleaning solvents that have lower ozone depletion potentials (ODP's); developing new, non-ozone-depleting solvents, such as terpenes; and developing low-residue soldering processes. This paper presents an overview of a joint testing program at Sandia and Motorola to evaluate a low-residue (no-clean) soldering process for printed wiring boards (PWB's). Such processes are in widespread use in commercial applications because they eliminate the cleaning operation. The goal of this testing program was to develop a database that could be used to support changes in the mil-specs. In addition, a joint task force involving industry and the military has been formed to conduct a follow-up evaluation of low-residue processes that encompass the concerns of the tri-services. The goal of the task force is to gain final approval of the low-residue technology for use in military applications. DOE

EPA'S SURVEY OF IN-USE DRIVING PATTERNS: IMPLICATIONS FOR MOBILE SOURCE EMISSION INVENTORIES
Phil Enns, John German, and Jim Markey 1993 20 p See also PB93-197903 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-118502) Avail: CASI HC A03

The paper presents EPA's preliminary findings on in-use driving behavior and vehicle emissions. EPA contracted for several large-scale studies of in-use driving patterns in order to assess the adequacy of the driving cycle used in the current FTP. The driving behavior characteristics covered here are: soak time, start driving, and speed and acceleration not represented in the current FTP. Two additional factors, air conditioning and road grade, are examined for their potential emission impact. Following this introduction, the paper is divided into five sections. This is followed by a discussion of EPA's cycle development efforts. The third section discusses the vehicle emission testing program and the fourth section presents an emission assessment based on the results of the test program. The last section summarizes the preliminary implications for current emission inventories.

Effects of climate change have during the last few years been addressed between hydrologists. In 1991 a research project: 'Climate Change and Energy Production' was started as a joint project between the Nordic countries. The scope of the project is to assess the impacts of a climate change on water resources. As the energy production in the Nordic countries heavily relies on hydropower, climate change impacts on water resources will also affect energy production systems as well as energy consumption. Therefore, the impacts on energy production are focused on in the project.

EFFECT OF LAND USE CHANGE ON THE CARBON CYCLE IN AMAZON SOILS Final Technical Report, 20 Feb. 1994
Susan E. Trumbore and Eric A. Davidson (Woods Hole Research Center, MA.) 1994 27 p
(Grant NAGw-2748)
(NASA-CR-195168; NAS 1.26:195168) Avail: CASI HC A03/MF A01

The overall goal of this study was to provide a quantitative understanding of the cycling of carbon in the soils associated with deep-rooting Amazon forests. In particular, we wished to apply the understanding gained by answering two questions: (1) what changes will accompany the major land use change in this region, the conversion of forest to pasture? and (2) what is the role of carbon stored deeper than one meter in depth in these soils? To construct carbon budgets for pasture and forest soils we combined the following: measurements of carbon stocks in above-ground vegetation, root biomass, detritus, and soil organic matter; rates of carbon inputs to soil and detrital layers using litterfall collection and sequential coring to estimate fine root turnover; C-14 analyses of fractionated SOM and soil CO2 to estimate residence times; C-13 analyses to estimate C inputs to pasture soils from C-4 grasses; soil pCO2, volumetric water content, and radon gradients to estimate CO2 production as a function of soil depth; soil respiration to estimate total C outputs; and a model of soil C dynamics that defines SOM fractions cycling on annual, decadal, and millennial time scales.

HUMAN IMPACTS ON SOIL CARBON DYNAMICS OF DEEP-ROOTED AMAZONIAN FORESTS Final Technical Report
Daniel C. Nepstad, Thomas A. Stone, and Eric A. Davidson 16 Feb. 1994 31 p
(Grant NAGw-2750)
(NASA-CR-195127; NAS 1.26:195127) Avail: CASI HC A03/MF A01

Deforestation and logging degrade more forest in eastern and southern Amazonia than in any other region of the world. This forest alteration affects regional hydrology and the global carbon cycle, but our current understanding of these effects is limited by incomplete knowledge of tropical forest ecosystems. It is widely agreed that roots are concentrated near the soil surface in moist tropical forests, but this generalization incorrectly implies that deep roots are unimportant in water and C budgets. Our results indicate that half of the closed-canopy forests of Brazilian Amazonic occur where rainfall is highly seasonal, and these forests rely on deeply penetrating roots to extract soil water. Pasture vegetation extracts less water from deep soil than the forest it replaces, thus increasing rates of drainage and decreasing rates of evapotranspiration. Deep roots are also a source of modern carbon deep in the soil. The soils of the eastern Amazon contain more carbon below 1 m depth than is present in above-ground biomass. As much as 25 percent of this deep soil C could have annual to decadal turnover times and may be lost to the atmosphere following deforestation. We compared the importance of deep roots in a mature, evergreen forest with an adjacent man-made pasture, the most common type of vegetation on deforested land in Amazonia. The study site is near the town of Paragominas, in the Brazilian state of Para, with a seasonal rainfall pattern and deeply-weathered, kaolinitic soils that are typical for large portions of Amazonia. Root distribution, soil water extraction, and soil carbon dynamics were studied using deep auger holes and shafts in each ecosystem, and the phenology and water status of the leaf canopies were measured. We estimated the geographical distribution of deeply-rooting forests using satellite imagery, rainfall data, and field measurements.

Nitrous oxide and methane are two of the gases primarily responsible for atmospheric warming, or the 'greenhouse effect'. Agricultural activities are an important source of methane and nitrous oxide emissions, but quantitation of these sources is generally lacking. This manual describes techniques to evaluate current emissions from diverse animal and crop production practices and suggests methods for decreasing these emissions. DOE

A method for a systematic approach to establishing priorities and formulating a clean up policy for potentially polluted former industrial sites is applied to the province of Noord-Brabant. The development of soil clean up policy in the Netherlands, and specifically in Noord-Brabant, between 1980 and 1990, is described. The selection of potentially polluting industrial activities from all economic activities in the Netherlands is discussed. The origin of industrial soil pollution is outlined. The development of environmental consciousness and environmental legislation in the Netherlands between 1800 and 1950 is discussed. The behavior of contaminants in the soil is described. A model with six variables to calculate the degree of soil pollution was developed. The main soil pollution on former industrial sites in Noord-Brabant are surveyed. ESA

COLLECTION AND EVALUATION OF NUMERICAL MODELS WITH THE AIM TO INVESTIGATE THE IMPACT OF AIRCRAFT EMISSIONS [ZUSAMMENSTELLUNG UND BEWERTUNG VON NUMERISCHEN MODELLEN IM HINBLICK AUF UNTERSUCHUNGEN ZU DEM THEMA SCHADSTOFFE IN DER LUFTFAHRT]
Martin Dameris Feb. 1993 43 p In GERMAN
(DLR-Mitt-93-06; ETN-94-95207) Avail: CASI HC A03/MF A01

Models which are used for examination and analysis of aircraft emissions and their effects on Earth climate are presented. Several classifications of models are depicted: radiation and transport models for atmospheric trace gases distributions, two dimensional models for annual variations of phenomena, and tropospherical and stratospherical models. One dimensional chemistry models are fitted to the estimation of vertical distributions of trace gases in the atmosphere and allow sensitivity studies to be realized. Two dimensional chemistry models are divided into Euler models, for describing the transport of a continuum at fixed points in a spatial grid, and Lagrange models, which consider air circulation. With global three dimensional models, partial differential equations can be solved for estimation of wind, temperature, mass, and pressure. With a coupling of dynamical and chemical processes, a parametrization for photochemical reactions regarding ozone can be developed. Some deficiencies of existing models are investigated with emphasis on the lack of global climate middle atmosphere models, for description of mutual troposphere/stratosphere interactions. The problem of computation time and computer capacity was addressed. ESA

COMPUTER ASSISTED ANALYSIS OF AURORAL IMAGES OBTAINED FROM HIGH ALTITUDE POLAR SATELLITES Final Report, Jul. 1988 - Jan. 1993
Ramin Samadani and Michael Flynn 7 Sep. 1993 18 p
(Contract NAS5-30428)
(NASA-CR-194873; NAS 1.26:194873) Avail: CASI HC A03/MF A01

Automatic techniques that allow the extraction of physically significant parameters from auroral images were developed. This allows the processing of a much larger number of images than is currently possible with manual techniques. Our techniques were applied to diverse auroral image datasets. These results were made available to geophysicists at NASA and at universities in the form of a software system that performs the analysis. After some feedback from users, an upgraded system was transferred to NASA and to two universities. The feasibility of user-trained search and retrieval of large amounts of data using our automatically derived parameter indices was demonstrated. Techniques based on classification and regression trees (CART) were developed and applied to broaden the types of images to which the automated search and retrieval may be applied. Our techniques were tested with DE-1 auroral images. Author (revised)

LOCALLY MODIFIED BOTT-SCHEME FOR HIGHLY CONVECTIVE FLOWS
Andreas Chlond Jan. 1993 40 p
(MPIM-99; ETN-94-95108) Avail: CASI HC A03/MF A01

A simple and effective self adjusting hybrid technique was introduced to develop a new conservative and monotonic advection scheme that exhibits very low numerical diffusion of resolvable scales. The proposed scheme combines Bott's area preserving flux form algorithm with an area preserving exponential interpolating scheme, the use of either at any particular location being automatically controlled by the local ratio of the nodal values involved in the approximation process. The performance of the combined scheme is illuminated in a series of one and two dimensional linear advection experiments. The comparative test calculations presented demonstrate that the combined scheme provides highly accurate solutions both in regions where the transported flow variable is smooth and in the vicinity of sharp gradients. The self adjusting hybrid technique is highly effective in removing numerical artefacts such as dispersive ripples and simultaneously requires only an admissible additional computational effort relative to Bott's scheme. It is thus concluded that the combined scheme is well suited for many atmospheric modeling applications where advection plays a significant role. ESA

CLIMATE VARIABILITY IN A COUPLED GCM. PART 2: THE INDIAN OCEAN AND MONSOON
Mojib Latif, Andreas Sterl (Royal Netherlands Meteorological Inst., De Bilt.), Michel Assenbaum, Martina M. Junge, and Ernst Maier-Reimer Apr. 1993 35 p Sponsored in part by Koerber Project
(Contract EV5V-CT92-0121)
(MPIM-104; ETN-94-95111) Avail: CASI HC A03/MF A01

The seasonal cycle and the interannual variability of the tropical Indian Ocean circulation and the Indian summer monsoon simulated by a coupled ocean atmosphere general circulation model (GCM) in a 26 year integration were investigated. Although the model exhibits significant climate drift, it simulates realistically the seasonal changes in the tropical Indian Ocean and the onset and evolution of the Indian summer monsoon. The amplitudes of the seasonal changes, however, are somewhat underestimated. The coupled GCM also simulates considerable interannual variability in the tropical Indian Ocean circulation which is partly related to the El Nino/southern oscillation (ENSO) phenomenon and the associated changes in the Walker circulation. Changes in the surface wind stress appear to be crucial in forcing interannual variations in the Indian Ocean sea surface temperature (SST). As in the Pacific Ocean, the net surface heat flux acts as a negative feedback on anomalies. The interannual variability in monsoon rainfall is simulated by the coupled GCM only about half as strongly as observed. This is related to the fact that the simulated interannual variability in the Indian monsoon is caused by internal processes within the atmosphere only. In contrast, observations show a clear lead-lag relationship between interannual variations in the monsoon rainfall and tropical Pacific SST anomalies. The atmospheric GCM also fails to reproduce this lead-lag relationship, when run in a stand alone integration with observed SSTs prescribed. These results indicate that important physical processes relating tropical Pacific SST to Indian monsoon rainfall are not adequately modeled in this atmospheric GCM. ESA

ATMOSPHERIC FLOW IN HETEROGENEOUS VEGETATED REGIONS M.S. Thesis
R. Luppes Feb. 1993 53 p
(W-9303; ETN-94-94788) Avail: CASI HC A04/MF A01

The simulation of atmospheric flow and fluxes during or after changes in surface properties is addressed. Wind velocity, temperature and specific humidity and the corresponding atmospheric fluxes of momentum, sensible heat and latent heat of an airflow which moves along different vegetated areas, are described. For example, a flow can be simulated during a heath-forest transition or the reverse, a forest-heath transition. In the model, the pressure terms are added in the atmospheric flow equations, following viscous boundary layer theory, which should give more realistic calculations. An upper boundary condition on the horizontal wind velocity in aerodynamics and boundary layer theory, the so called interaction law, is used, instead of the matched load condition on the upper friction velocity as used by Klaassen. The equations are solved by means of habitual methods of numerical mathematics. The structure of the computer program SAFFACS, which solves the model is described, making use of the program easier as the solution of the model by means of iterative processes is explained. ESA

AN IMPROVED GRAVITY MODEL FOR MARS: GODDARD MARS MODEL-1 (GMM-1)
D. E. Smith, F. J. Lerch, R. S. Nerem, M. T. Zuber, G. B. Patel (Hughes STX, Inc., Lanham, MD.), S. K. Fricke (RMS Technologies, Inc., Landover, MD.), and F. G. Lemoine (Colorado Univ., Boulder.) Washington May 1993 51 p Original contains color illustrations
(NASA-TM-104584; NAS 1.15:104584; Rept-93B00077) Avail: CASI HC A04/MF A01; 3 functional color pages

Doppler tracking data of three orbiting spacecraft have been reanalyzed to develop a new gravitational field model for the planet Mars, GMM-1 (Goddard Mars Model-1). This model employs nearly all available data, consisting of approximately 1100 days of S-bank tracking data collected by NASA's Deep Space Network from the Mariner 9, and Viking 1 and Viking 2 spacecraft, in seven different orbits, between 1971 and 1979. GMM-1 is complete to spherical harmonic degree and order 50, which corresponds to a half-wavelength spatial resolution of 200-300 km where the data permit. GMM-1 represents satellite orbits with considerably better accuracy than previous Mars gravity models and shows greater resolution of identifiable geological structures. The notable improvement in GMM-1 over previous models is a consequence of several factors: improved computational capabilities, the use of optimum weighting and least-squares collocation solution techniques which stabilized the behavior of the solution at high degree and order, and the use of longer satellite arcs than employed in previous solutions that were made possible by improved force and measurement models. The inclusion of X-band tracking data from the 379-km altitude, near-polar orbiting Mars Observer spacecraft should provide a significant improvement over GMM-1, particularly at high latitudes where current data poorly resolves the gravitational signature of the planet. SPATIAL AND TEMPORAL VARIABILITY OF SOIL TEMPERATURE, MOISTURE AND SURFACE SOIL PROPERTIES Final Report
B. F. Hajek and J. H. Dane 25 Aug. 1993 58 p Original contains color illustrations
(Grant NAGw-0758)
(NASA-CR-194109; NAS 1.26:194109; AU-5-34046) Avail: CASI HC A04/MF A01; 4 functional color pages

The overall objectives of this research were to: (l) Relate in-situ measured soil-water content and temperature profiles to remotely sensed surface soil-water and temperature conditions; to model simultaneous heat and water movement for spatially and temporally changing soil conditions; (2) Determine the spatial and temporal variability of surface soil properties affecting emissivity, reflectance, and material and energy flux across the soil surface. This will include physical, chemical, and mineralogical characteristics of primary soil components and aggregate systems; and (3) Develop surface soil classes of naturally occurring and distributed soil property assemblages and group classes to be tested with respect to water content, emissivity and reflectivity. This document is a report of studies conducted during the period funded by NASA grants. The project was designed to be conducted over a five year period. Since funding was discontinued after three years, some of the research started was not completed. Additional publications are planned whenever funding can be obtained to finalize data analysis for both the arid and humid locations. Derived from text

The Earth's magnetic field, through its variability over a spectrum of spatial and temporal scales, contains fundamental information on the solid Earth and geospace environment (the latter comprising the atmosphere, ionosphere, and magnetosphere). Integrated studies of the geomagnetic field have the potential to address a wide range of important processes in the deep mantle and core, asthenosphere, lithosphere, oceans, and the solar-terrestrial environment. These studies have direct applications to important societal problems, including resource assessment and exploration, natural hazard mitigation, safe navigation, and the maintenance and survivability of communications and power systems on the ground and in space. Studies of the Earth's magnetic field are supported by a variety of federal and state agencies as well as by private industry. Both basic and applied research is presently supported by several federal agencies, including the National Science Foundation (NSF), U.S. Geological Survey (USGS), U.S. Department of Energy (DOE), National Oceanic and Atmospheric Administration (NOAA), National Aeronautics and Space Administration (NASA), and U.S. Department of Defense (DOD) (through the Navy, Air Force, and Defense Mapping Agency). Although each agency has a unique, well-defined mission in geomagnetic studies, many areas of interest overlap. For example, NASA, the Navy, and USGS collaborate closely in the development of main field reference models. NASA, NSF, and the Air Force collaborate in space physics. These interagency linkages need to be strengthened. Over the past decade, new opportunities for fundamental advances in geomagnetic research have emerged as a result of three factors: well-posed, first-order scientific questions; increased interrelation of research activities dealing with geomagnetic phenomena; and recent developments in technology. These new opportunities can be exploited through a national geomagnetic initiative to define objectives and encourage coordination of efforts among federal and state agencies, academic institutions, and industry to systematically characterize the spatial and temporal behavior of the Earth's magnetic field on local, regional, and global scales in order to understand the physical processes in the solid earth and geospace environment, and to apply this understanding to a variety of scientific problems and to technical and societal needs.

DYNAMIC RAY TRACING AND ITS APPLICATION IN TRIANGULATED MEDIA Ph.D. Thesis

A. Rueger Jul. 1993 76 p
(Contract DE-FG02-89ER-14079)
(DE94-000875; DOE/ER-14079/27; CWP-139) Avail: CASI HC A05/MF A01

Hale and Cohen developed software to generate two-dimensional computer models of complex geology. Their method uses a triangulation technique designed to support efficient and accurate computation of seismic wavefields for models of the earth's interior. Subsequently, Hale used this triangulation approach to perform dynamic ray tracing and create synthetic seismograms based on the method of Gaussian beams. Here, I extend this methodology to allow an increased variety of ray-theoretical experiments. Specifically, the developed program GBmod (Gaussian Beam MODeling) can produce arbitrary multiple sequences and incorporate attenuation and density variations. In addition, I have added an option to perform Fresnel-volume ray tracing. Corrections for reflection and transmission losses at interfaces, and for two-and-one-half-dimensional (2.5-D) spreading are included. However, despite these enhancements, difficulties remain in attempts to compute accurate synthetic seismograms if strong lateral velocity inhomogeneities are present. Here, these problems are discussed and, to a certain extent, reduced. I provide example computations of high-frequency seismograms based on the method of Gaussian beams to exhibit the advantages and disadvantages of the proposed modeling method and illustrate new features for both surface and vertical seismic profiling (VSP) acquisition geometries. DOE

PHYSICS OF IRON

O. Anderson Oct. 1993 86 p Presented at the 14th International Conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO, 27 Jun. - 2 Jul. 1993
(Contract W-7405-eng-48)
(DE94-002002; CONF-930676-Suppl) Avail: CASI HC A05/MF A01

This volume comprises papers presented at the AIRAPT Conference, 28 June - 2 July 1993. The iron sessions at the meeting were identified as the Second Ironworkers Convention. The renewal of interest stems from advances in technologies in both diamond-anvil cell (DAC) and shock wave studies as well as from controversies arising from a lack of consensus among both experimentalists and theoreticians. These advances have produced new data on iron in the pressure-temperature regime of interest for phase diagrams and for temperatures of the core/mantle and inner-core/outer-core boundaries. Particularly interesting is the iron phase diagram inferred from DAC studies. A new phase, (beta), with a (gamma)-(beta)-(epsilon) triple point at about 30 GPa and 1190 K, and possible sixth phase, (omega), with an (epsilon)-(Theta)-melt triple point at about 190 GPa and 4000 K are deemed possible. The importance of the equation of state of iron in consideration of Earth's heat budget and the origin of its magnetic field invoke the interest of theoreticians who argue on the basis of molecular dynamics and other first principles methods. While the major thrust of both meetings was on the physics of pure iron, there were notable contributions on iron alloys. Hydrogen-iron alloys, iron-sulfur liquids, and the comparability to rhenium in phase diagram studies are discussed. The knowledge of the physical properties of iron were increased by several contributions. DOE

DATA ANALYSIS AND THEORETICAL STUDIES OF THE UPPER MESOSPHERE AND LOWER THERMOSPHERE Annual Report, Apr. 1993 - Apr. 1994

Alan Burns and Timothy L. Killeen 4 Feb. 1994 42 p
(Grant NAGw-3457)
(NASA-CR-195108; NAS 1.26:195108) Avail: CASI HC A03/MF A01

The work proposed under this grant came in three parts. The first involved extending our continuing study of electrodynamical feedback between the thermosphere/ionosphere and the magnetosphere. The second was a model-experiment comparison study of global dynamics and the third was a 'spectral energetics' analysis of tidal dissipation and energy exchange mechanisms. In the past year, progress has been made on all three topics. A paper is in press about electrodynamic feedback, and another is also in press on an element of the 'spectral energetics' analysis. Furthermore, a paper is being prepared on global dynamics variations in response to geomagnetic storms. In addition, much of the data needed for further studies on global dynamics is being prepared for inclusion in a relational database. This report is organized into several separate sections. In the next section, we present an introduction to the work that we are doing in this proposal. We discuss the progress made in our work and some results in section 3. In the last section, we summarize the work.

TROPOSPHERIC OZONE LIDAR INTERCOMPARISON EXPERIMENT, TROLIX 1991 Field Phase Report

Jens Boesenberg, Gerard Ancellet (Centre National de la Recherche Scientifique, Verrieres-Le Buisson, France.), Arnoud Apituley (Rijksinstituut voor Volksgezondheid en Milieuhygieene, Bilthoven, Netherlands.), Hans Bergwerff (Rijksinstituut voor Volksgezondheid en Milieuhygieene, Bilthoven, Netherlands.), Goetz v.Cossart (Academy of Sciences, Kuhlungsborn, German D.R..), Hans Edner (Lund Inst. of Tech., Sweden.), Jens Fiedler (Academy of Sciences, Kuhlungsborn, German D.R..), Bo Galle (Institutet foer Vatten-Och Luftvaardsforskning, Goeteborg, Sweden.), Cora deJonge (Rijksinstituut voor Volksgezondheid en Milieuhygieene, Bilthoven, Netherlands.), and Johan Mellqvist (Institutet foer Vatten-Och Luftvaardsforskning, Goeteborg, Sweden.) et al Apr. 1993 244 p
(MPIM-102; ETN-94-95109) Avail: CASI HC A11/MF A03

The TROLIX '91 experiment, which was based on the simultaneous operation of different types of Differential Absorption Lidars (DIAL), a special version of a Differential Optical Absorption Spectroscopy (DOAS) instrument, helicopter borne in situ instruments, and many other supporting measurements, is addressed. The major objectives of the experiment were: to determine, which and how many wavelengths are required for a sufficiently accurate ozone retrieval in the lower troposphere, in the presence of aerosol, water vapor, oxygen, sulfur dioxide, and possibly other pollutants; to assess the accuracy which can be achieved under realistic conditions; to compare the performance of different types of systems already developed; to compare lidar to in situ measurements; to study ozone vertical distribution with high temporal resolution and coverage (including diurnal cycle); and to study the relation between ground level ozone concentrations and vertical distribution for several meteorological conditions. The general methodology is introduced, the instruments are described, the experimental operations are explained, and a selection of data are presented. Examples for the results of the intercomparison are given, as far as they were available at the present stage of evaluation. An overview of the material collected during the experiment is provided in order to facilitate further detailed studies in cooperation between the different groups which have participated. ESA

STEADY INDUCTION EFFECTS IN GEOMAGNETISM. PART 1C: GEOMAGNETIC ESTIMATION OF STEADY SURFICIAL CORE MOTIONS: APPLICATION TO THE DEFINITIVE GEOMAGNETIC REFERENCE FIELD MODELS
Coerte V. Voorhies NASA. Washington Oct. 1993 28 p
(NASA-TP-3272-Pt-1C; NAS 1.60-3272-Pt-1C; Rept-94B00008-Pt-1C)
Avail: CASI HC A03/MF A01

In the source-free mantle/frozen-flux core magnetic earth model, the non-linear inverse steady motional induction problem was solved using the method presented in Part 1B. How that method was applied to estimate steady, broad-scale fluid velocity fields near the top of Earth's core that induce the secular change indicated by the Definitive Geomagnetic Reference Field (DGRF) models from 1945 to 1980 are described. Special attention is given to the derivation of weight matrices for the DGRF models because the weights determine the apparent significance of the residual secular change. The derived weight matrices also enable estimation of the secular change signal-to-noise ratio characterizing the DGRF models. Two types of weights were derived in 1987-88: radial field weights for fitting the evolution of the broad-scale portion of the radial geomagnetic field component at Earth's surface implied by the DGRF's, and general weights for fitting the evolution of the broad-scale portion of the scalar potential specified by these models. The difference is non-trivial because not all the geomagnetic data represented by the DGRF's constrain the radial field component. For radial field weights (or general weights), a quantitatively acceptable explication of broad-scale secular change relative to the 1980 Magsat epoch must account for 99.94271 percent (or 99.98784 percent) of the total weighted variance accumulated therein. Tolerable normalized root-mean-square weighted residuals of 2.394 percent (or 1.103 percent) are less than the 7 percent errors expected in the source-free mantle/frozen-flux core approximation. MESOSPHERIC AND LOWER THERMOSPHERIC WINDS, TEMPERATURES DENSITIES, AND VOLUME EMISSION RATES Annual Report
Timothy L. Killeen 1994 23 p
(Grant NAG1-1315)
(NASA-CR-195147; NAS 1.26:195147) Avail: CASI HC A03/MF A01

This memo has been written to report on the progress made under grant NAG1-1315 and to request a continuation of funding for this work. Our proposal involved a plan to utilize an existing ground-based chain of optical and radar facilities to assemble a comprehensive, long-term, multi-station base of upper-mesospheric and lower thermospheric measurements of neutral winds, temperatures, and volume emission rates that can be used to make comparisons with data from the HRDI and WINDII instruments that are flying aboard the UARS spacecraft. The ground-based, optical data were to be obtained on a routine basis from five geographically separated observatories at: Thule, Greenland; Sondrestrom, Greenland; Watson Lake, Yukon (replacing Calgary, Alberta); Ann Arbor, Michigan; and Maynooth, Eire. Several different optical instruments are present at these sites: the total array of instruments is comprised of five Fabry-Perot interferometers, two half meter Ebert-Fastie spectrometers, one all-sky CCD imager, and a near infra-red Michelson Fourier transform spectrometer. In addition to these optical instruments, data were to be obtained from the incoherent scatter radar at Sondrestrom, Greenland. These radar measurements are comprised of neutral winds, temperatures, and densities from altitudes between approximately 70 - 120 km. The optical measurements are obtained locally from specific altitudes depending on the emission line studied. For example, red line optical data come from about 220 km. In this report we summarize the progress made in obtaining these data and relate it to the specific tasks outlined in the original grant application. These tasks are discussed in the next section. Progress towards their completion is discussed in section three, while future plans and summary are described in section four. Derived from text

NORTHERN HEMISPHERE TROPOSPHERIC MID-LATITUDE CIRCULATION AFTER VIOLENT VOLCANIC ERUPTIONS
Hans-F. Graf, Judith Perlwitz (Zentralinstitut fuer Kernforschung, Berlin, Germany.), and Ingo Kirchner May 1993 24 p
(Contract BMFT-07-KFT-86/2)
(MPIM-107; ETN-94-95112) Avail: CASI HC A03/MF A01

The strengths of the polar stratospheric vortex and geopotential height anomalies of the 500 hPa layer were studied shortly after violent volcanic eruptions. After all tropical eruptions, the polar stratospheric vortex was intensified. The tropospheric anomaly patterns after tropical eruptions are very similar to those of Winter months with a very strong stratospheric vortex, irrespective of whether volcanically forced or not. Hence, if they have any effect on the wintertime tropospheric circulation, tropical eruptions seem to force a natural mode of the stratospheric Winter circulation which is associated with a specific response of the tropospheric circulation with maximum amplitude over the North Atlantic and adjacent continental regions. Therefore, it remains difficult to give statistical evidence of volcanic impact on climate on the basis of the few observations after these rare events. A combination of observational studies and model experiments may help to overcome these difficulties in the future. ESA

THE TRANSITION FROM DIAPIRISM TO DIKE INTRUSION: IMPLICATIONS FOR PLANETARY VOLCANISM Status Report, 1 Apr. 1993 - 31 Mar. 1994
Allan M. Rubin 1994 4 p
(Grant NAGw-3589)
(NASA-CR-195133; NAS 1.26:195133) Avail: CASI HC A01/MF A01

Magma transport processes influence the rate of magma transport and how far the magma travels before it freezes, the degree to which the magma communicates chemically with the host rock, the morphology of volcanic landforms on planetary surfaces, the interplay between magmatism and regional tectonics, and even the direction the magma moves. The primary question motivating this research is: How does magma rheology influence the mechanisms by which it is transported through planetary lithospheres? It is widely recognized that on Earth basaltic intrusions typically take the form of narrow dikes, while granites are typically found in more equidimensional plutons. Several explanations for this observation were offered over the last 50 years. While basalts and rhyolites vary somewhat in temperature and density, the major difference is the 2 to 8 orders of magnitude contrast in viscosity. The significant ductile strains associated with many granitic plutons has led to the statement that the occurrence of granites in diapirs rather than dikes results from the fact that there is insufficient viscosity contrast between the magma and wall rock for the granite to intrude narrow cracks. A second explanation states that granites are so viscous that they cannot propagate far before freezing. Despite the length of time these explanations have been around, there has been relatively little effort to investigate them quantitatively. My goal has been to evaluate these explanations through a series of well-posed numerical models. These models can be tested by the decades of field data collected by structural geologists that have yet to be integrated into any coherent theory, and the results should have important implications for volcanism on the terrestrial planets. Anisotropy in the electrical properties of the earth's material is a widespread phenomenon and its effect in the transient electromagnetic measurements of geophysical prospecting must be quantified. The authors consider the calculation of the quasi-static electrical field quantities, electrical potential and the vertical component of total volume density of electric current, in a horizontally layered, piecewise homogeneous and arbitrarily anisotropic earth due to a system of current-carrying electrodes. Using a one-sided time Laplace transformation with real positive parameter, and a Fourier transformation with respect to the horizontal space coordinates, the authors obtain, from (Maxwell's) quasi-static equations, the system of transform-domain differential equations in the vertical (depth) coordinate. At each interface of the layered earth the scattering-matrix formalism relates the outward flow constituents to the inward ones. The general formalism that has been developed is applied to the specific cases of both an anisotropic infinite medium and some two-layer problems. NTIS

HAMILTONIAN APPROACH TO FAIRLY LOW AND LONG GRAVITY WAVES
W. A. vanDerVeen and F. W. Wubs 1993 31 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-111119; W-9314) Avail: Issuing Activity (National Technical Information Service (NTIS))

The study relates to irrotational nonlinear dispersive gravity waves in an inviscid incompressible fluid. In Chapter 2 we derive an alternative positive-definite first-order approximation to the Hamiltonian. In the implementation of this alternative only two Helmholtz-type equations need to be solved and the matrix is symmetric. Numerical aspects are considered in Chapter 3. For the time-integration of our Boussinesq equations the classical fourth-order Runge-Kutta method was used and for spatial discretization we used fourth-order accurate discretization schemes. The conjugate gradient method was employed in conjunction with a preconditioning for solving the Helmholtz-type equations. Two preconditioning techniques were used: polynomial preconditioning and preconditioners based on incomplete Cholesky decomposition. Some first results are presented in Chapter 4. The results obtained by the two models differ only by a few percents, which is quite acceptable. The speed improvement is about 2.5. NTIS

Processing of seismic data requires more and more sophisticated techniques as hydrocarbon plays get smaller and smaller. Depth migration, for example, depends on accurate velocity models of the subsurface to obtain correctly imaged depth sections or depth cubes of small hydrocarbon reservoirs. Much research is carried out on new techniques for the estimation of such macro-velocity models. Currently, research is concentrated in two directions: techniques for estimating the velocity of the weather layer (the ultra shallow zone), and techniques for estimating the macro model of the total overburden (of the deep zone). The objective of this thesis is to present an improved and cost-effective data acquisition and inversion technique that provides a velocity macro model of ultra shallow and the shallow zone, using an algorithm that incorporates all available information. Under AFOSR grant F49620-92-J-0498, Barcilon and Nathan are studying the impact of steady, zonally varying vorticity forcing on topographic instability and finite amplitude, low frequency oscillations. The model consists of a viscous, barotropic fluid on a zonally periodic, midlatitude B-plane channel, bounded above by a flat, rigid boundary, below by a bottom topography, and laterally by sidewalls at y = o,TT Topographically induced low frequency oscillations in the presence of a steady, zonally varying vorticity source have been studied. The source has been shown to interact with the perturbation field to produce zonally rectified wave fluxes that change the zonal momentum balance of the system. This change provides a mechanism for coupling the topographic and vorticity forcings leading to a dramatic alteration in the Hopf bifurcation from stationary to low frequency, finite amplitude oscillation. This report covers the time period 1 Jul. to 31 Dec. 1993. There were no balloon or airplane flights during this reporting period, instead we concentrated on analyzing our existing data. This was facilitated by a recently completed program of enhancements made in our data reduction software. We are using our data sets to examine the changes in stratospheric chemistry over a variety of time scales. Ongoing projects include investigating the diurnal variation of OH, HO2, and H2O2 and exploring their relationships with other simultaneously measured species; measuring long term trends in HF and HCl; and looking for changes caused by the June 1991 Pinatubo eruption. We are also continuing to analyze the large set of data collected during the AASE 2. Author (revised)

Effort for the first year has concentrated on: (1) preparing a gravity wave climatology; (2) documenting a long-lived large-amplitude wake low trough event on 16-17 November 1987; and (3) analyzing the large-amplitude gravity wave present in the notable Midwest cyclone of 15 December 1987. The gravity wave climatology is based on hourly surface observations spanning a 10 - 15 year period at approximately 100 stations distributed fairly evenly across the United States. Preliminary results (7 stations) suggest that large-amplitude gravity wave events occur at a frequency of one or two times per year at a given station. It is hypothesized that the more complete wave-event climatology to be derived in the second year will show regional variations understandable in terms of characteristic synoptic-scale signatures conducive to wave genesis. In the 16-17 November 1987 wake low event, the wake trough remains confined to the back edge of the precipitation shield associated with a major mesoscale convective system over the lower Mississippi Valley. The approach of the wake trough is marked by the cessation of precipitation and the onset of gusty easterly winds, consistent with simple gravity wave theory. Finally, in the 15 December 1987 Midwest gravity wave event, present research is focused on the initiation of the wave event; preliminary results suggest that frontogenetical forcing may be contributing to wave generation. (NASA-CR-194858; NAS 1.26:194858) Avail: CASI HC A06/MF A02

Presented in this study are the results of controlled partially polarimetric measurements of thermal emission at 91.65 GHz from a striated water surface as corroborated by a geometrical optics radiative model. The measurements were obtained outdoors using a precision polarimetric radiometer which directly measured the first three modified Stokes' parameters. Significant variations in these parameters as a function of azimuthal water wave angle were found, with peak-to-peak variations in T(sub u) of up to approximately 10 K. The measurements are well corroborated by the GO model over a range of observations angles from near nadir up to approximately 65 degrees from nadir. The model incorporates both multiple scattering and a realistic downwelling background brightness field. Derived from text

GEOMAGNETIC FIELD MODELS INCORPORATING PHYSICAL CONSTRAINTS ON THE SECULAR VARIATION Final Report, 1 Jan. 1992 - 31 Dec. 1993
Catherine Constable and Robert L. Parker 1993 3 p
(Grant NAGw-2966)
(NASA-CR-195165; NAS 1.26:195165) Avail: CASI HC A01/MF A01

This proposal has been concerned with methods for constructing geomagnetic field models that incorporate physical constraints on the secular variation. The principle goal that has been accomplished is the development of flexible algorithms designed to test whether the frozen flux approximation is adequate to describe the available geomagnetic data and their secular variation throughout this century. These have been applied to geomagnetic data from both the early and middle part of this century and convincingly demonstrate that there is no need to invoke violations of the frozen flux hypothesis in order to satisfy the available geomagnetic data. ELECTROMAGNETIC FIELD CHANGES AS A PRECURSORY PHENOMENA OF EARTHQUAKES AND VOLCANIC ERUPTIONS Interim Report [CHIKAKU HAKAI NO ZENCHO GENSHO TO SHITENO DENJI HOSHA NO TOKUSEI NI KANSURU KENKYU]
Yoshimori Honkura, Yuri Kuwata, Osamu Nishizawa, Tsuneo Ishido, Xinglin Lei, Kinichiro Kusunose, Yuji Enomoto, Hiroshi Hashimoto, Shigeyuki Mori, and Yoshiyuki Asabe et al 29 Mar. 1993 401 p In ENGLISH and JAPANESE
(Rept-157; JTN-94-80510) Avail: CASI HC A18/MF A04

The systematic approach to the prediction of earthquakes and volcanic eruptions is expected to provide a more reliable information for issuing alarms to mitigate the disasters. There is a growing interest in the electromagnetic radiation phenomena of low frequency as a candidate of imminent precursory phenomena. The principal objective of this research project is to evaluate the phenomena to know whether and how they are useful for the prediction. The approaches were directed the following categories: (1) analytical estimation of decay of the electromagnetic signals originated from source regions in heterogeneous media in conductivity; (2) laboratory experiments of rock fracture to infer the dominant mechanism of the electromagnetic phenomena preceding the crustal ruptures; and (3) field experiments by various measurement instruments to find the most efficient physical equations to be observed, locate source region, and to find probabilistic relations of anomarous phenomena with earthquake and with volcanic eruptions. This project involves obtaining GPS measurements in Scandinavia, and using the measurements to estimate the viscosity profile of the Earth's mantle and to correct tide-gauge measurements for the rebound effect. Below, we report on several aspects of this project. The DSGS was occupied in August 1993. This campaign also inaugurated SWEPOS, the Swedish permanent GPS network. Initial results are presented in Johansson et al., a copy of which is contained in Appendix A. An important technical advance we intend for this project is to use the full three dimensional site velocity information for inferring geophysical parameters. To this end, we have investigated using VLBI determined baseline length rates in North America to constraining proposed combinations of ice history and earth rheology, and presented this work in Mitrovica et al., a copy of which is contained in Appendix B. For individual titles, see N94-25204 through N94-25205.

FIRST RESULTS FROM THE FENNOSCANDIAN GPS NETWORKS
J. M. Johansson and R. T. K. Jaldehag *In* Smithsonian Astrophysical Observatory, Measurement and Interpretation of Crustal Deformation Rates Associated with Postglacial Rebound Dec. 1993 12 p Presented at the AGU Fall Meeting, 1993 (For primary document see N94-25203 06-46)
Avail: CASI HC A03/MF A01

Temporal correlations were measured of data obtained by the Swedish Permanent GPS Network for Positioning (SWEPOS). The model for correlations, r(Delta t) = exp(-(absolute value of (Delta t))/tau), can be used to predict precision of averaged values for different values of tau. Results indicate that tau is approximately equal to 1 day (r less than 1% after 5 days). The results show that the network can be used in geophysical applications such as the DOSE investigation on postglacial rebound. Derived from text

CONSTRAINING PROPOSED COMBINATIONS OF ICE HISTORY AND EARTH RHEOLOGY USING VLBI DETERMINED BASELINE LENGTH RATES IN NORTH AMERICA
J. X. Mitrovica, J. L. Davis (Smithsonian Astrophysical Observatory, Cambridge, MA.), and I. I. Shapiro (Smithsonian Astrophysical Observatory, Cambridge, MA.) *In* Smithsonian Astrophysical Observatory, Measurement and Interpretation of Crustal Deformation Rates Associated with Postglacial Rebound Dec. 1993 4 p Sponsored in part by NSERC and Smithsonian Institute (For primary document see N94-25203 06-46)
Avail: CASI HC A01/MF A01

We predict the present-day rates of change of the lengths of 19 North American baselines due to the glacial isostatic adjustment process. Contrary to previously published research, we find that the three dimensional motion of each of the sites defining a baseline, rather than only the radial motions of these sites, needs to be considered to obtain an accurate estimate of the rate of change of the baseline length. Predictions are generated using a suite of Earth models and late Pleistocene ice histories, these include specific combinations of the two which have been proposed in the literature as satisfying a variety of rebound related geophysical observations from the North American region. A number of these published models are shown to predict rates which differ significantly from the VLBI observations. Author

DOWNWARD EXTRAPOLATION OF MULTI-COMPONENT SEISMIC DATA Ph.D. Thesis
Gregory Carlo Haime 1992 170 p Sponsored by DELPHI Consortium
(ISBN-9-09-005213-5; ETN-94-95373) Copyright Avail: CASI HC A08/MF A02

An evaluation of the problems involved in elastic seismic migration is presented. Elastic wave field extrapolated operators are presented that are applicable to a general three dimensional elastic and anisotropic medium. Although the elastic operators derived are stand alone elements and can be used in any migration scheme, they are developed to take part in the stepwise elastic inversion scheme proposed by Berkhout and Wapenaar. The advantages of multicomponent seismic acquisition are discussed. The necessity of multicomponent data in elastic processing is demonstrated by an example, and a global description of all modules in the stepwise elastic inversion scheme is given. Elastic P and S extrapolation operators are derived starting from the full elastic Kirchhoff-Helmholtz integral. An analysis of the contribution of the different elastic terms in the extrapolation process is presented. It is made clear that there are many different ways to generate extrapolation operators for a so called macro model. (Such a macro model represents a global description of the subsurface in terms of velocities and densities and must be estimated before the actual extrapolation step can be performed.) A quantitative error analysis of the extrapolation operators proposed is performed. The influence of macro model errors on the amplitudes of the extrapolated P and S wave fields is examined. The use of the elastic P and S extrapolation operators in redatuming and migration schemes is considered. ESA

DECOMPOSITION OF MULTI-COMPONENT MEASUREMENTS INTO P AND S WAVES Ph.D. Thesis

Philippe Charles Herrmann 1992 178 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISBN-9-09-005197-X; ETN-94-95365) Copyright Avail: CASI HC A09

Elastic wavefield decomposition is defined as a transformation of a two way vector wavefield representation into a one way scalar wavefield representation. Starting from this definition and using the relations between the two way and normal one way wavefield components, a general formalism for the wavefield decomposition of elastic waves was developed. For surface seismic data the following topics were addressed: two Dimensional (2D) and 3D seismic wavefields; isotropic and anisotropic media; lateral variant media; wave decomposition at the detector and source side; extra wavefield information; and sensitivity analysis. It was concluded that proper preprocessing (statics, coupling) prior to decomposition is a prerequisite with surface land data. In the case of a low velocity near surface medium, the wavetype separation is largely made by the horizontal and vertical component source/receivers. The same topics were addressed for data acquisition along a borehole, the so called VSP technique. Due to the strong vertical velocity variations that may occur along the VSP well, the wavefield decomposition has to be done in the space-frequency domain. If the data can be well fitted by few plane waves (by for example, two downgoing, two upgoing) it is preferable to do a parametric wavefield decomposition. If the data is complex, it is preferrable to do the wavefield decomposition by means of convolutional products. As the convolution operators play an important part in wavefield decomposition, it is interesting to continue their development. For instance, the weighting function, as introduced for the computation of the operators in the space-frequency domain, is defined in a very simple manner. An improvement will be obtained by updating the weighting function in an iterative way (one or two iterations). ESA

THE SCATTERING AND COLLISION OF GRAVITATIONAL WAVES IN FRIEDMANN-ROBERTSON-WALKER OPEN UNIVERSES
Jiri Bicak (Karlova Univ., Prague, Czechoslovakia.) and Jerry B. Griffiths Aug. 1993 17 p Sponsored by Loughborough Univ. of Technol., England; Royal Society, London, England; and Cambridge Univ., England
(MATHS-Rept-A-193; ETN-94-95230) Avail: CASI HC A03/MF A01

An exact solution which describes the scattering of a gravitational wave in an open expanding universe is described. The background region ahead of the wave is taken to be a Friedmann-Robertson-Walker (k = 1) space-time containing a perfect fluid with an extreme relativistic equation of state p = rho. Plane surfaces are determined in this background. Solutions describing the scattering of a single wave with a wave front given by such a surface and the collision of two such waves can be obtained. HIGH LATITUDE CUSP SIGNATURE OBSERVATIONS FOR SOUTHWARD IMF B SUB Z Final Report, 15 May 1989 - 14 May 1992
Per Hoeg Mar. 1993 24 p
(Grant AF-AFOSR-0459-89)
(AD-A273801; AD-E201703; PL-TR-93-2068) Avail: CASI HC A03/MF A01

High latitude coherent and incoherent radar systems have given much new information about the physical processes at auroral latitudes. This report presents observational features of the Cusp, situated close to magnetic noon at 70-75 degrees inv. latitude, when the Interplanetary Magnetic Field of the Solar Wind is southward and staying southward for more than half a day. For this condition, the observations of the convectional flow pattern comply with the two-cell model of the global convectional flow at auroral and polar cap latitudes. During moderate disturbed magnetic conditions, the temporal extent of the Cusp can be defined by an increased F-region electron density, while the E-region density decreases or stays constant for mostly northward convectional flow in the magnetic noon sector. The temporal extent of this condition is observed to be up to two hours. When the Cusp is overhead of the radars in Sondre Stromfjord, Greenland, the ionograms show enhanced spread-F condition, a phenomenon associated to electron density enhancements in a turbulent plasma, which flows into the polar cap. Ionogram oblique F-region traces are observed in conjunction with drifting patches. Patches drift through the Cusp region, but they are also observed before and after the defined Cusp and seem not to be confined by the latter. Spectral analysis of F-region electron density variations in the noon sector has been performed. Periods down to the Pc5 range are observed more frequently in the northward convectional flow regime near noon than in the adjacent time sectors. The same analysis of the magnetic pulsations from the Greenland Magnetometer Chain give periods of 10 minutes in the whole dawn sector until the time when the Cusp is observed by the radars. DTIC

A NIGHTTIME STRUCTURE MODEL OF ATMOSPHERIC OPTICAL TURBULENCE, c2(n), DERIVED FROM THERMOSONDE AND HIGH RESOLUTION RAWINSONDE MEASUREMENTS Interim Report, Jan. 1991 - Jan. 1993
James H. Brown 26 Jan. 1993 70 p
(AD-A273803; ADXC-E201701; PL-TR-93-2016; ERP-1119; XC-PL/HANSCOM) Avail: CASI HC A04/MF A01

Data from fifteen thermosonde flights was used to develop a simple nighttime structure model of C2 sub n. High resolution rawinsondes provide fine scale estimates of atmospheric temperature gradients and variances of wind speed. Nonlinear regression applied between the thermosonde and rawinsonde measurements provides the model C2 sub n estimator. This quasi-empirical model is based upon the theoretical description given by Tatarski and upon an exponentially scaled estimate of a theoretical model of the eddy dissipation rate given by Weinstock. A discussion of previous models and a comparison with the Dewan et al. microshear model is presented. Model profiles computed for other sites and seasons are compared favorably to related thermosonde profiles. DTIC

PARAMETRIC AND NONPARAMETRIC DISCRIMINANTS FOR REGIONAL EARTHQUAKES AND EXPLOSIONS
Joseph E. Cavanaugh, Allan D. McQuarrie, and Robert H. Shumway 31 Jul. 1993 54 p
(Contract F19628-91-K-0033)
(AD-A273807; AD-E201709; PL-TR-93-2164; SR-2) Avail: CASI HC A04/MF A01

Conventional methods for discriminating between earthquakes and explosions at regional distances have concentrated on extracting specific features such as amplitude and spectral ratios from the waveforms of the P and S phases. We consider here an optimum nonparametric classification procedure derived from the classical approach to discriminating between two Gaussian processes with unequal spectra. Two robust variations based on the minimum discrimination information statistic and Renyi's entropy are also considered. We compare the optimum classification procedure with various amplitude and spectral ratio discriminants and show that its performance is superior when applied to a small population of 8 land-based earthquakes and 8 mining explosions recorded in Scandinavia. Several parametric characterizations of the notion of complexity based on modeling earthquakes and explosions as autoregressive or modulated autoregressive processes are also proposed and their performance compared with the nonparametric and feature extraction approaches. The small lidar system has been used to measure the vertical structure of the atmospheric extinction in a dune area bordering The Hague (The Netherlands), at about 2.6 km from the North Sea. The atmospheric optical properties at this location are determined by a mixture of industrial, urban, rural and marine aerosols, which composition depends on the air mass history. The measurements were made unattended, around the clock, five days a week. About 250 extinction profiles were recorded every day. This report reviews the data base obtained and presents some selected results. The lidar system is described briefly. Factors influencing the accuracy of the inversion of lidar signals are discussed. ESTIMATES OF MONTHLY MEAN SOIL MOISTURE FOR 1979-1989
J. Schemm (General Sciences Corp., Laurel, MD.), S. Schubert, J. Terry (General Sciences Corp., Laurel, MD.), and S. Bloom (Universities Space Research Association, Columbia, MD.) Oct. 1992 240 p
(NASA-TM-104571; NAS 1.15:104571; Rept-93B00006) Avail: CASI HC A11/MF A03

This technical report presents estimated monthly mean global soil moisture distributions for 1979-1989. The soil moisture datasets were prepared as part of the boundary conditions for an atmospheric general circulation model (GEOS-1). Also included are the 11-year averages of monthly mean soil moisture, surface air temperature, monthly total precipitation, evapotranspiration, and potential evapotranspiration. The standard deviation of the monthly mean soil moisture is provided as a measure of year-to-year variability. Author (revised)

MONTE CARLO CLIMATE CHANGE FORECASTS WITH A GLOBAL COUPLED OCEAN-ATMOSPHERE MODEL
U. Cubasch (Deutsches Klimarechenzentrum G.m.b.H., Hamburg, Germany.), B. D. Santer (Lawrence Livermore National Lab., CA.), A. Hellbach (Deutsches Klimarechenzentrum G.m.b.H., Hamburg, Germany.), G. Hegerl, H. Hoeck, E. Maier-Reimer, U. Mikolajewicz, A. Stoessel, and R. Voss (Hamburg Univ., Germany.) Dec. 1992 47 p Sponsored by BMFT; Max-Planck-Gesellschaft; Freie und Hansestadt Hamburg; and EEC
(MPIM-97; ETN-94-95107) Avail: CASI HC A03/MF A01

The Monte Carlo approach, which has increasingly been used during the last decade in the field of extended range weather forecasting, was applied for climate change experiments. Four integrations with a global coupled ocean-atmosphere model were started from different initial conditions, but with the same greenhouse gas forcing according to the IPCC scenario A. All experiments were run for a period of 50 years. The results indicate that the time evolution of the global mean warming depends strongly on the initial state of the climate system. It can vary between 6 and 31 years. The Monte Carlo approach delivers information about both the mean response and the statistical significance of the response. While the individual members of the ensemble show a considerable variation in the climate change pattern of temperature after 50 years, the ensemble mean climate change pattern closely resembles the pattern obtained in a 100 year integration and is, at least over most of the land areas, statistically significant. The ensemble averaged sea level change due to thermal expansion is significant in the global mean and locally over wide regions of the Pacific. The hydrological cycle is also significantly enhanced in the global mean, but locally the changes in precipitation and soil moisture are masked by the variability of the experiments. ESA

A series of model simulations were used to try to understand the origins of Low Frequency (LF) variations and the role of the seasonal cycle, if any, in its generation. This modeling work is complementary to the observed data analysis of part one in which it was found that simulations with ocean and atmospheric general circulation models and a hybrid coupled model reproduce well the observed features of variability in the LF mode. The model results show the origins of the LF to be in the ocean and suggest this phenomenon is a natural mode of the tropical Pacific Basin. Air-sea interactions amplify the ocean mode by a factor of 5 to 6 so it obtains climatological importance. These same interactions introduce the LF to the atmosphere. The physical processes responsible for these results are presented. The LF mode of interannual variability is not directly driven by the annual cycle. But it does depend importantly on the fact that the ocean-atmosphere coupling strength varies with respect to the annual cycle. The LF mode appears to be rather sharply peaked in wave number space but broadbanded in frequency space. ESA

ON TESTING TWO MAJOR CUMULUS PARAMETERIZATION SCHEMES USING THE CSU REGIONAL ATMOSPHERIC MODELING SYSTEM
C. Y. J. Kao, J. E. Bossert, J. Winterkamp, and C. C. Lai 1993 8 p Presented at the 74th American Meteorological Society Annual Meeting, Nashville, TN, 23-28 Jan. 1994
(Contract W-7405-eng-36)
(DE94-000703; LA-UR-93-3439; CONF-940115-3) Avail: CASI HC A02/MF A01

One of the objectives of the DOE ARM Program is to improve the parameterization of clouds in general circulation models (GCM's). The approach taken in this research is two fold. The behavior of cumulus parameterization schemes are examined by comparing their performance against the results from explicit cloud simulations with state-of-the-art microphysics. This is conducted in a two-dimensional (2-D) configuration of an idealized convective system. The cumulus parameterization schemes are then applied to realistic three-dimensional (3-D) simulations over the western US for a case with an enormous amount of convection in an extended period of five days. In the 2-D idealized tests, cloud effects are parameterized in the 'parameterization cases' with a coarse resolution, whereas each cloud is explicitly resolved by the 'microphysics cases' with a much finer resolution. Thus, the capability of the parameterization schemes in reproducing the growth and life cycle of a convective system can then be evaluated. These 2-D tests will form the basis for further 3-D realistic simulations which have the model resolution equivalent to that of the next generation of GCM's. Two cumulus parameterizations are used in this research: the Arakawa-Schubert (A-S) scheme used in Kao and Ogura and the Kuo scheme used in Tremback. The numerical model used in this research is the Regional Atmospheric Modeling System (RAMS) developed at Colorado State University (CSU). DOE

Temperature records indicate that a global warming of 0.5 to 0.7 C has occurred over the past century. Whether this trend is a result of increased trace gas concentrations in the atmosphere or simply a result of natural variability is still not known. These temperature trends are derived from thousands of observations worldwide. However, these observations are concentrated largely over continental areas, and then mainly in the northern hemisphere's populated regions. This northern hemisphere continental bias results in large uncertainties in estimates of global temperature trends. Due to the increasing evidence that the present buildup of greenhouse gases in the atmosphere may result in an additional global warming of 1-5 C by the year 2050, it is increasingly important to find alternative methods to monitor fluctuations in global surface temperatures. As shown by two recent studies, the global atmospheric electric circuit may provide a promising alternative for monitoring future climate change. DOE

ATMOSPHERIC MOISTURE FIELDS DERIVED BY SATELLITE OBSERVATIONS OVER THE TROPICAL PACIFIC OCEAN Abstract Only
Hyosang Chung (Yonsei Univ., Seoul, Republic of Korea.) May 1993 2 p
(Grant NAG8-845)
(NASA-CR-194852; NAS 1.26:194852) Avail: CASI HC A01/MF A01

Values of precipitable water are retrieved over the tropical and subtropical Pacific Ocean from TOVS infrared and microwave channel brightness temperature and OLR observations by means of stepwise linear regression. The most useful temperature and moisture sensing channels are pre-selected from sensitivity tests of a radiative transfer model. Numerous models are developed and tested against collocated radiosonde observations and Nimbus-7 SMMR precipitable water estimates. For RAOB comparisons, the best estimator used 15 TOVS predictors and captured 71.1 deg percent of the variance (+0.62 g/sq cm standard error) for column precipitable water; for precipitable water of 700-500 mb bulk layer, these values were 71.7 percent and +/- 0.17 g/sq cm. Little skill of estimated precipitable water was obtained for moisture above 500 mb. Regressions were less skillful against SMMR, unless collocation parameters were tightly controlled; SMMR was less acceptable than RAOB's because of observational drift and errors. Generally, the most skillful predictors were boundary layer brightness temperatures of TOVS channels and satellite estimated stability indices. 'Moisture channels' were hardly useful except for estimating middle and upper tropospheric moisture. Additional regression models were constructed testing the sensitivity to different observational and meteorological characteristics. Models which used some in situ observations surface observations or stabilities calculated from RAOB, were the most successful. The best of these explained 87.5 percent of the variance but the regression selected almost no TOVS channels, relying instead on conventional RAOB and surface observations. A set of four regression models were developed, stratifying atmospheric characteristics on the basis of collocated OLR values. These models improved the variance explained by 5.0 percent; the model associated with the highest OLR values (275 W/sq m less than or equal to OLR; that is, no cloud) showed only marginal skill. Precipitable water fields were generated from the best TOVS-only model for seven days in January 1983 and compared with SMMR-estimated fields. OLR fields and ECMWF precipitable water analysis. The TOVS regression model compared favorably to the SMMR analysis in amplitudes and features. It revealed more evolving synoptic signal than the ECMWF analysis. In synoptically active regions, it differed with respect to the OLR analysis, primarily because of actual differences in the vertical distribution of water vapor. Author (revised)

UNCERTAINTIES IN CLIMATE DATA SETS
James P. McGuirk 1992 6 p Presented at the 17th NOAA Diagnostic Workshop, Norman, OK, Oct. 1992
(Grant NAG8-845)
(NASA-CR-194848; NAS 1.26:194848) Avail: CASI HC A02/MF A01

Climate diagnostics are constructed from either analyzed fields or from observational data sets. Those that have been commonly used are normally considered ground truth. However, in most of these collections, errors and uncertainties exist which are generally ignored due to the consistency of usage over time. Examples of uncertainties and errors are described in NMC and ECMWF analyses and in satellite observational sets-OLR, TOVS, and SMMR. It is suggested that these errors can be large, systematic, and not negligible in climate analysis. Author

CONVECTIVE ORGANIZATION IN THE PACIFIC ITCZ: MERGING OLR, TOVS, AND SSM/I INFORMATION
Patrick M. Hayes and James P. McGuirk 1993 2 p Presented at the 20th AMS Conference on Hurricanes and Tropical Meteorology, San Antonio, TX, May 1993
(Grant NAG8-845)
(NASA-CR-194850; NAS 1.26:194850) Avail: CASI HC A01/MF A01

One of the most striking features of the planet's long-time average cloudiness is the zonal band of concentrated convection lying near the equator. Large-scale variability of the Intertropical Convergence Zone (ITCZ) has been well documented in studies of the planetary spatial scales and seasonal/annual/interannual temporal cycles of convection. Smaller-scale variability is difficult to study over the tropical oceans for several reasons. Conventional surface and upper-air data are virtually non-existent in some regions; diurnal and annual signals overwhelm fluctuations on other time scales; and analyses of variables such as geopotential and moisture are generally less reliable in the tropics. These problems make the use of satellite data an attractive alternative and the preferred means to study variability of tropical weather systems. Derived from text

MODELLING TOVS RADIANCES OF SYNOPTIC SYSTEMS Abstract Only
Thomas Eddy Coe Dec. 1992 2 p
(Grant NAG8-845)
(NASA-CR-194847; NAS 1.26:194847) Avail: CASI HC A01/MF A01

Two operational analysis models, produced by ECMWF and NMC, are compared against observed satellite radiances by converting the analyzed variables into synthetic radiances using a radiative transfer model (RTM). Observed TOVS satellite radiances are used as a ground truth, since they are the only source of continuous, synoptic-scale resolution observations available over the data-sparse tropical Pacific Ocean. It is assumed that if the analysis models correctly simulate atmospheric conditions, the observed and modelled radiance fields will have similar patterns and magnitudes. In each of seven TOVS channels examined, the mean temperature difference between the models was small, but the differences between the models and the observations were large. The mean temperature difference within each channel was larger than the standard deviation in most cases. The moisture channels of the RTM were sensitive to changes in moisture content, but none of the channels were significantly affected by changes in temperature. Single-day modelled radiance analyses contain synoptic information similar to the satellite observations. ECMWF is often too noisy, producing features not verified by the satellite; NMC is often too smooth. NMC more closely resembles the TOVS contours. Modelled water vapor channel analyses resemble observed monthly and composited observations well, but do not accurately reproduce the highly-variable single-day fields. ECMWF generally has more accurate gradients. Neither model simulates the tropics well. The water vapor channels, especially channel eleven (weighted at 700 mb), most closely resembled the tropical plume composite described by McGuirk and Ulsh. The only plume evidence found in the thermal or microwave channels, in either the observations or the models, was a composite trough situated in the correct location, extending from the mid-latitudes into the subtropics. This feature was not readily discernable until the definition and mature stages. Additional information besides the modelled temperatures would be required to produce an accurate forecast for the tropics. Model patterns more closely resembled the observations in the quiescent atmosphere, though the magnitudes were not any closer. ECMWF simulates the TOVS quiescent state better than NMC. The moisture channels continue to present the most realistic patterns. The models contained more detail in the tropics than was verified by the satellite observations, apparently trying to force an active ITCZ. Lag correlations showed TOVS to be more persistent than the models. TOVS also showed a smoother lag trend, but all products appeared to have adequate ability to react to changes in the atmosphere over time. Author (revised)

DIAGNOSTIC BUDGETS OF ANALYZED AND MODELLED TROPICAL PLUMES
James P. McGuirk and Gerry W. Vest May 1993 2 p Presented at the 20th Conference on Hurricanes and Tropical Meteorology, San Antonio, TX, May 1993
(Grant NAG8-845)
(NASA-CR-194853; NAS 1.26:194853) Avail: CASI HC A01/MF A01

Blackwell et al. successfully simulated tropical plumes in a global barotropic model valid at 200 mb. The plume evolved in response to strong equatorial convergence which simulated a surge in the Walker Circulation. The defining characteristics of simulated plumes are: a subtropical jet with southerlies emanating from the deep tropics; a tropical/mid-latitude trough to the west; a convergence/divergence dipole straddling the trough; and strong cross contour flow at the tropical base of the jet. Diagnostic budgets of vorticity, divergence, and kinetic energy are calculated to explain the evolution of the modelled plumes. Budgets describe the unforced (basic) state, forced plumes, forced cases with no plumes, and ECMWF analyzed plumes. Derived from text

PRECIPITATION MEASUREMENT USING SIR-C: A FEASIBILITY STUDY
Atiq Ahamad and Richard K. Moore Nov. 1993 36 p
(Contract NAS7-918)
(NASA-CR-195104; NAS 1.26:195104; RSL-TR-8370-1) Avail: CASI HC A03/MF A01

A precipitation detection and measurement experiment is planned for the SIR-C/X-SAR mission. This study was conducted to determine under what conditions an off-nadir experiment is feasible. The signal-to-clutter ratio, the signal-to-noise ratio, and the minimum detectable rain rate were investigated. Available models, used in previous studies, were used for the surface clutter and the rain echo. The study also considers the attenuation of the returns at X band. It was concluded that an off-nadir rain-measurement experiment is feasible only for rain rates greater than 10 mm/hr for look angles greater than 60 deg. For the range of look angles 5 less than theta(sub 1) less than 50, the rain rate required is very high for adequate signal-to-clutter ratio, and hence the feasibility of the experiment. A REGIONAL ANALYSIS OF CLOUDY MEAN SPHERICAL ALBEDO OVER THE MARINE STRATOCUMULUS REGION AND THE TROPICAL ATLANTIC OCEAN M.S. Thesis
Kathryn M. Ginger Dec. 1993 133 p
(Grant NAGw-3150)
(NASA-CR-194771; NAS 1.26:194771) Avail: CASI HC A07/MF A02

Since clouds are the largest variable in Earth's radiation budget, it is critical to determine both the spatial and temporal characteristics of their radiative properties. The relationships between cloud properties and cloud fraction are studied in order to supplement grid scale parameterizations. The satellite data used is from three hourly ISCCP (International Satellite Cloud Climatology Project) and monthly ERBE (Earth Radiation Budget Experiment) data on a 2.5 deg x 2.5 deg latitude-longitude grid. Mean cloud spherical albedo, the mean optical depth distribution, and cloud fraction are examined and compared off the coast of California and the mid-tropical Atlantic for July 1987 and 1988. Individual grid boxes and spatial averages over several grid boxes are correlated to Coakley's theory of reflection for uniform and broken layered cloud and to Kedem, et al.'s findings that rainfall volume and fractional area of rain in convective systems is linear. Kedem's hypothesis can be expressed in terms of cloud properties. That is, the total volume of liquid in a box is a linear function of cloud fraction. Results for the marine stratocumulus regime indicate that albedo is often invariant for cloud fractions of 20% to 80%. Coakley's satellite model of small and large clouds with cores (1 km) and edges (100 m) is consistent with this observation. The cores maintain high liquid water concentrations and large droplets while the edges contain low liquid water concentrations and small droplets. Large clouds are just a collection of cores. The mean optical depth (TAU) distributions support the above observation with TAU values of 3.55 to 9.38 favored across all cloud fractions. From these results, a method based upon Kedem, et al's theory is proposed to separate the cloud fraction and liquid water path (LWP) calculations in a general circulation model (GCM). In terms of spatial averaging, a linear relationship between albedo and cloud fraction is observed. For tropical locations outside the Intertropical Convergence Zone (ITCZ), results of cloud fraction and albedo spatial averaging followed that of the stratus boxes containing few overcast scenes. Both the ideas of Coakley and Kedem, et al. apply. Within the ITCZ, the grid boxes tended to have the same statistical properties as stratus boxes containing many overcast scenes. Because different dynamical forcing mechanisms are present, it is difficult to devise a method for determining subgrid scale variations. Neither of the theories proposed by Kedem, et al. or Coakley works well for the boxes with numerous overcast scenes. Author (revised)

ESTIMATION OF THE RAIN SIGNAL IN THE PRESENCE OF LARGE SURFACE CLUTTER
Atiq Ahamad and Richard K. Moore Jan. 1994 16 p
(Contract NAS7-918)
(NASA-CR-195105; NAS 1.26:195105; RSL-TR-8730-3) Avail: CASI HC A03/MF A01

The principal limitation for the use of a spaceborne imaging SAR as a rain radar is the surface-clutter problem. Signals may be estimated in the presence of noise by averaging large numbers of independent samples.

This method was applied to obtain an estimate of the rain echo by averaging a set of N(sub c) samples of the clutter in a separate measurement and subtracting the clutter estimate from the combined estimate. The number of samples required for successful estimation (within 10-20%) for off-vertical angles of incidence appears to be prohibitively large. However, by appropriately degrading the resolution in both range and azimuth, the required number of samples can be obtained. For vertical incidence, the number of samples required for successful estimation is reasonable. In estimating the clutter it was assumed that the surface echo is the same outside the rain volume as it is within the rain volume. This may be true for the forest echo, but for convective storms over the ocean the surface echo outside the rain volume is very different from that within. It is suggested that the experiment be performed with vertical incidence over forest to overcome this limitation. Author (revised)

THE THREE-DIMENSIONAL STRUCTURE OF THE INFRARED CIRRUS Final Technical Report

John E. Gaustad 10 Jan. 1994 3 p
(Grant NAG5-1152)
(NASA-CR-194870; NAS 1.26:194870) Avail: CASI HC A01/MF A01

This project was carried out over a period of four years, beginning 6/15/89 and continuing through 9/15/93. Intermediate results have been reported as poster papers at several meetings of the American Astronomical Society. A brief summary was presented in April 1993 at a symposium on the infrared cirrus. The final results were published in late 1993. The measurements have been deposited in NASA's Astronomical Data Center. Briefly, the results are as follows: Using the IRAS data base, we surveyed the 1808 06-B9.5 stars in the Bright Star Catalog for extended excess emission at 60 micrometers, indicating the presence of heated dust (cirrus hotspots) at the location of the star. Measurements of the angular size and infrared flux at 12, 25, 60 and 100 micrometers were obtained for 302 objects. From these basic data we calculated the radius, absorption, optical depth, color temperature, and dust density for each object. Arguing that the stars are randomly distributed point probes of the ISM, we showed that the filling factor of the dust-bearing component of the ISM is 14.6 + 2.4 percent within 400 pc of the sun for clouds with an equivalent hydrogen density greater than 0.5 cm(exp -3). Above a density of 1.0 cm(exp -3) the density distribution function appears to follow a power law of index -1.25. Further, we showed that the dust is distributed more sparsely in a region near the sun about 60 pc wide and extending several hundred parsecs in the direction of longitudes 80-260 deg. The distances to the dust clouds were determined from the spectroscopic parallaxes of the embedded stars; when the HIPPARCOS parallaxes become available, we will be able to produce a more accurate three-dimensional view of the local ISM. IMPLEMENTATION OF A STATE OF THE ART AUTOMATED SYSTEM FOR THE PRODUCTION OF CLOUD/WATER VAPOR MOTION WINDS FROM GEOSTATIONARY SATELLITES Progress Report, 1 Jul. - 31 Dec. 1993

Christopher S. Velden Feb. 1994 12 p
(Grant NAG8-974)
(NASA-CR-195087; NAS 1.26:195087) Avail: CASI HC A03/MF A01

The thrust of the proposed effort under this contract is aimed at improving techniques to track water vapor data in sequences of imagery from geostationary satellites. In regards to this task, significant testing, evaluation, and progress was accomplished during this period. Sets of winds derived from Meteosat data were routinely produced during Atlantic hurricane events in the 1993 season. These wind sets were delivered via Internet in real time to the Hurricane Research Division in Miami for their evaluation in a track forecast model. For eighteen cases in which 72-hour forecasts were produced, thirteen resulted in track forecast improvements (some quite significant). In addition, quality-controlled Meteosat water vapor winds produced by NESDIS were validated against rawinsondes, yielding an 8 m/s RMS. This figure is comparable to upper-level cloud drift wind accuracies. Given the complementary horizontal coverage in cloud-free areas, we believe that water vapor vectors can supplement cloud-drift wind information to provide good full-disk coverage of the upper tropospheric flow. The impact of these winds on numerical analysis and forecasts will be tested in the next reporting period. Derived from text

PRECIPITATION MEASUREMENT USING SIR-C: A FEASIBILITY STUDY. INVESTIGATION AT NADIR

Atiq Ahamad and Richard K. Moore Dec. 1993 24 p
(Contract NAS7-918)
(NASA-CR-195103; NAS 1.26:195103; RSL-TR-8370-2) Avail: CASI HC A03/MF A01

The most significant limitation of the imaging SAR in rain measurements is the ground return coupled to the rain cell. Here we report a study of the possibility of using the X-SAR and the C-band channel of SIR-C for rain measurement. Earlier signal-to-clutter calculations rule out the use of X-SAR at steeper off-vertical angles of incidence (i.e., 20 less than theta less than 50). Only rain rates greater than 30 mm/hr at angles of incidence greater than 60 degrees showed good signal-to-clutter ratio (SCR). This study involved calculations at vertical incidence. There is adequate signal-to-noise ratio (SNR) at vertical incidence, but the presence of high-range side-lobe levels leads to small SCR for measurement over oceans at both X and C bands. For larger rain thickness (greater than two km), the SCR gets better and smaller rain rates (greater than 10 mm/hr) can be measured. However, rain measurements over forests seem to be feasible at nadir even for smaller rain thickness (less than two km). We conclude that X band may be usable over the forest at vertical incidence to measure rain rates greater than five mm/hr even for shallow rain thickness and over ocean for large rain thickness. NIMBUS-7 TOTAL OZONE MAPPING SPECTROMETER (TOMS) DATA PRODUCTS USER'S GUIDE

Richard D. McPeters, Arlin J. Krueger, P. K. Bhartia, Jay R. Herman, Arnold Oaks, Ziuddin Ahmad (Hughes STX, Inc., Lanham, MD.), Richard P. Cebula (Hughes STX, Inc., Lanham, MD.), Barry M. Schlesinger (Hughes STX, Inc., Lanham, MD.), Tom Swissler (Hughes STX, Inc., Lanham, MD.), and Steven L. Taylor (Hughes STX, Inc., Lanham, MD.) et al Washington Nov. 1993 93 p
(Contract NAS5-29386; RTOP 916-00-00)
(NASA-RP-1323; Rept-94B00013; NAS 1.61:1323) Avail: CASI HC A05/MF A01

Two tape products from the Total Ozone Mapping Spectrometer (TOMS) aboard the Nimbus-7 have been archived at the National Space Science Data Center. The instrument measures backscattered Earth radiance and incoming solar irradiance; their ratio -- the albedo -- is used in ozone retrievals. In-flight measurements are used to monitor changes in the instrument sensitivity. The algorithm to retrieve total column ozone compares the observed ratios of albedos at pairs of wavelengths with pair ratios calculated for different ozone values, solar zenith angles, and optical paths. The initial error in the absolute scale for TOMS total ozone is 3 percent, the one standard-deviation random error is 2 percent, and the drift is +/- 1.5 percent over 14.5 years. The High Density TOMS (HDTOMS) tape contains the measured albedos, the derived total ozone amount, reflectivity, and cloud-height information for each scan position. It also contains an index of SO2 contamination for each position. The Gridded TOMS (GRIDTOMS) tape contains daily total ozone and reflectivity in roughly equal area grids (110 km in latitude by about 100-150 km in longitude). Detailed descriptions of the tape structure and record formats are provided. Author

REPORT OF THE PROCEEDINGS OF THE COLLOQUIUM AND WORKSHOP ON MULTISCALE COUPLED MODELING

Steven E. Koch, ed. Washington Jun. 1993 131 p Workshop held in Calverton, MD, 22-25 Feb. 1993
(NASA-CP-3217; Rept-93B00083; NAS 1.55:3217) Avail: CASI HC A07/MF A02

The Colloquium and Workshop on Multiscale Coupled Modeling was held for the purpose of addressing modeling issues of importance to planning for the Cooperative Multiscale Experiment (CME). The colloquium presentations attempted to assess the current ability of numerical models to accurately simulate the development and evolution of mesoscale cloud and precipitation systems and their cycling of water substance, energy, and trace species. The primary purpose of the workshop was to make specific recommendations for the improvement of mesoscale models prior to the CME, their coupling with cloud, cumulus ensemble, hydrology, air chemistry models, and the observational requirements to initialize and verify these models. For individual titles, see N94-24375 through N94-24400.

UNITED STATES WEATHER RESEARCH PROGRAM (USWRP)

Chandrakant Bhumralkar *In* NASA. Goddard Space Flight Center, Report of the Proceedings of the Colloquium and Workshop on Multiscale Coupled Modeling Jun. 1993 p 3-4 (For primary document see N94-24374 06-47)

Avail: CASI HC A01/MF A02

After more than a decade of development by a broad cross-section of the U.S. atmospheric research community involved in planning for the National STORM Program, the Subcommittee on Atmospheric Research (SAR) of the Committee on Earth and Environmental Science (CEES) led the development of a strategic plan to realize the objectives of STORM so as to improve our nation's capability to provide accurate short-term forecasts of weather. This strategic plan will guide the planning and implementation of what is now called the United States Weather Research Program (USWRP). The USWRP is charged with achieving operational atmospheric prediction based on mesoscale observations and model results and establishing the scientific and technological basis for global atmospheric mesoscale prediction by the year 2000. The key scientific questions that are addressed under USWRP are discussed. Author (revised)

GEWEX CONTINENTAL-SCALE INTERNATIONAL PROJECT (GCIP)

Paul Try *In* NASA. Goddard Space Flight Center, Report of the Proceedings of the Colloquium and Workshop on Multiscale Coupled Modeling Jun. 1993 p 4-6 (For primary document see N94-24374 06-47)

Avail: CASI HC A01/MF A02

The Global Energy and Water Cycle Experiment (GEWEX) represents the World Climate Research Program activities on clouds, radiation, and land-surface processes. The goal of the program is to reproduce and predict, by means of suitable models, the variations of the global hydrological regime and its impact on atmospheric and oceanic dynamics. However, GEWEX is also concerned with variations in regional hydrological processes and water resources and their response to changes in the environment such as increasing greenhouse gases. In fact, GEWEX contains a major new international project called the GEWEX Continental-scale International Project (GCIP), which is designed to bridge the gap between the small scales represented by hydrological models and those scales that are practical for predicting the regional impacts of climate change. The development and use of coupled mesoscale-hydrological models for this purpose is a high priority in GCIP. The objectives of GCIP are presented. Author (revised)

GEWEX CLOUD SYSTEMS STUDY (GCSS)

Mitch Moncrieff *In* NASA. Goddard Space Flight Center, Report of the Proceedings of the Colloquium and Workshop on Multiscale Coupled Modeling Jun. 1993 p 6-8 (For primary document see N94-24374 06-47)

Avail: CASI HC A01/MF A02

The Global Energy and Water Cycle Experiment (GEWEX) Cloud Systems Study (GCSS) program seeks to improve the physical understanding of sub-grid scale cloud processes and their representation in parameterization schemes. By improving the description and understanding of key cloud system processes, GCSS aims to develop the necessary parameterizations in climate and numerical weather prediction (NWP) models. GCSS will address these issues mainly through the development and use of cloud-resolving or cumulus ensemble models to generate realizations of a set of archetypal cloud systems. The focus of GCSS is on mesoscale cloud systems, including precipitating convectively-driven cloud systems like MCS's and boundary layer clouds, rather than individual clouds, and on their large-scale effects. Some of the key scientific issues confronting GCSS that particularly relate to research activities in the central U.S. are presented. Author (revised)

GEWEX WATER VAPOR PROJECT (GVaP)

David Starr *In its* Report of the Proceedings of the Colloquium and Workshop on Multiscale Coupled Modeling Jun. 1993 p 8- (For primary document see N94-24374 06-47)

Avail: CASI HC A01/MF A02

The goal of the Global Energy and Water Cycle Experiment (GEWEX) Water Vapor Project (GVaP) is to improve the understanding of water vapor in meteorological, hydrological, and climatological processes through improving knowledge of water vapor and its variability on all scales. This goal clearly requires a multiscale observing strategy. A pilot project was deemed the most appropriate first step toward achieving this goal. An implementation plan was developed for this pilot phase. The four research components of the pilot phase are presented here. Author (revised)

AVIATION WEATHER PROGRAM (AWP)

Brant Foote *In* NASA. Goddard Space Flight Center, Report of the Proceedings of the Colloquium and Workshop on Multiscale Coupled Modeling Jun. 1993 p 11 (For primary document see N94-24374 06-47)

Avail: CASI HC A01/MF A02

The Aviation Weather Program (AWP) combines additional weather observations, improved forecast technology, and more efficient distribution of information to pilots, controllers, and automated systems to improve the weather information provided to the air traffic control system, pilots, and other users of aviation weather information. Specific objectives include the needs to: improve airport and en-route capacity by accurate, high resolution, timely forecasts of changing weather conditions affecting airport and en-route operations; improve analyses and forecasts of upper-level winds for efficient flight planning and traffic management; and increase flight safety through improved aviation weather hazard forecasting (e.g. icing, turbulence, severe storms, microbursts, or strong winds). The AWP would benefit from participation in a cooperative multiscale experiment by obtaining data for: evaluation of aviation weather forecast products, analysis of four dimensional data assimilation schemes, and experimental techniques for retrieving aerosol and other visibility parameters. A multiscale experiment would also be helpful to AWP by making it possible to evaluate the added benefit of enhanced data sets collected during the experiment on those forecast and analysis products. The goals of the Coperative Multiscale Experiment (CME) are an essential step in attaining the long-term AWP objective of providing two-to-four hour location-specific forecasts of significant weather. Although the possibility of a funding role for the AWP in the CME is presently unclear, modest involvement of Federal Aviation Administration (FAA)/AWP personnel could be expected. Derived from text

SCIENTIFIC GOALS OF THE COOPERATIVE MULTISCALE EXPERIMENT (CME)

William Cotton *In* NASA. Goddard Space Flight Center, Report of the Proceedings of the Colloquium and Workshop on Multiscale Coupled

Modeling Jun. 1993 p 12-15 (For primary document see N94-24374 06-47)
Avail: CASI HC A01/MF A02

Mesoscale Convective Systems (MCS) form the focus of CME. Recent developments in global climate models, the urgent need to improve the representation of the physics of convection, radiation, the boundary layer, and orography, and the surge of interest in coupling hydrologic, chemistry, and atmospheric models of various scales, have emphasized the need for a broad interdisciplinary and multi-scale approach to understanding and predicting MCS's and their interactions with processes at other scales. The role of mesoscale systems in the large-scale atmospheric circulation, the representation of organized convection and other mesoscale flux sources in terms of bulk properties, and the mutually consistent treatment of water vapor, clouds, radiation, and precipitation, are all key scientific issues concerning which CME will seek to increase understanding. The manner in which convective, mesoscale, and larger scale processes interact to produce and organize MCS's, the moisture cycling properties of MCS's, and the use of coupled cloud/mesoscale models to better understand these processes, are also major objectives of CME. Particular emphasis will be placed on the multi-scale role of MCS's in the hydrological cycle and in the production and transport of chemical trace constituents. The scientific goals of the CME consist of the following: understand how the large and small scales of motion influence the location, structure, intensity, and life cycles of MCS's; understand processes and conditions that determine the relative roles of balanced (slow manifold) and unbalanced (fast manifold) circulations in the dynamics of MCS's throughout their life cycles; assess the predictability of MCS's and improve the quantitative forecasting of precipitation and severe weather events; quantify the upscale feedback of MCS's to the large-scale environment and determine interrelationships between MCS occurrence and variations in the large-scale flow and surface forcing; provide a data base for initialization and verification of coupled regional, mesoscale/hydrologic, mesoscale/chemistry, and prototype mesoscale/cloud-resolving models for prediction of severe weather, ceilings, and visibility; provide a data base for initialization and validation of cloud-resolving models, and for assisting in the fabrication, calibration, and testing of cloud and MCS parameterization schemes; and provide a data base for validation of four dimensional data assimilation schemes and algorithms for retrieving cloud and state parameters from remote sensing instrumentation. GRAND CHALLENGE SCIENTIFIC QUESTIONS IN COUPLED MODELING

Steven Koch *In its* Report of the Proceedings of the Colloquium and Workshop on Multiscale Coupled Modeling Jun. 1993 p 15-17 (For primary document see N94-24374 06-47)
Avail: CASI HC A01/MF A02

Most convective field experiments in the past (e.g., SESAME, CCOPE, CINDE) have attempted to resolve only the immediate scales of moist convection using network arrays that spanned two or three atmospheric scales at most. Furthermore, these scales have been defined more on practical considerations (cost, manpower, etc.) than on a clear understanding of their theoretical significance. Unfortunately, this has precluded a description of the entire life cycle of MCS's and their interaction with larger scale systems, the land surface, and trace species. Fortunately, the following factors now make it possible to attempt to simulate scale contraction processes from the synoptic scale down to the cloud scale, as well as interactions between complex meteorological, land surface, precipitation, chemical, and hydrologic processes with coupled, multiscale models: the availability of new technology to sample meteorological fields at high temporal and spatial resolution over a broad region made possible by the weather observing modernization program; increased computer power and improved numerical approaches to run limited area models with nonhydrostatic precipitation physics so as to explicitly resolve MCS (Mesoscale Convective System) processes; and four dimensional assimilation of non-conventional data to provide dynamically consistent datasets for diagnostic analysis of nonlinear scale-interactive dynamics. Several examples of scale-interactive processes which present grand challenges for coupled, multiscale modeling were presented. Derived from text

NEXT GENERATION INITIATION TECHNIQUES

Tom Warner (Pennsylvania State Univ., University Park.), John Derber (National Meteorological Center, Camp Springs, MD.), Milija Zupanski (National Meteorological Center, Camp Springs, MD.), Steve Cohn, and Hans Verlinde (Colorado State Univ., Fort Collins.) *In its* Report of the Proceedings of the Colloquium and Workshop on Multiscale Coupled Modeling Jun. 1993 p 17-19 (For primary document see N94-24374 06-47)
Avail: CASI HC A01/MF A02

Four-dimensional data assimilation strategies can generally be classified as either current or next generation, depending upon whether they are used operationally or not. Current-generation data-assimilation techniques are those that are presently used routinely in operational-forecasting or research applications. They can be classified into the following categories: intermittent assimilation, Newtonian relaxation, and physical initialization. It should be noted that these techniques are the subject of continued research, and their improvement will parallel the development of next generation techniques described by the other speakers. Next generation assimilation techniques are those that are under development but are not yet used operationally. Most of these procedures are derived from control theory or variational methods and primarily represent continuous assimilation approaches, in which the data and model dynamics are 'fitted' to each other in an optimal way. Another 'next generation' category is the initialization of convective-scale models. Intermittent assimilation systems use an objective analysis to combine all observations within a time window that is centered on the analysis time. Continuous first-generation assimilation systems are usually based on the Newtonian-relaxation or 'nudging' techniques. Physical initialization procedures generally involve the use of standard or nonstandard data to force some physical process in the model during an assimilation period. Under the topic of next-generation assimilation techniques, variational approaches are currently being actively developed. Variational approaches seek to minimize a cost or penalty function which measures a model's fit to observations, background fields and other imposed constraints. Alternatively, the Kalman filter technique, which is also under investigation as a data assimilation procedure for numerical weather prediction, can yield acceptable initial conditions for mesoscale models. The third kind of next-generation technique involves strategies to initialize convective scale (non-hydrostatic) models. Derived from text

EXAMPLES OF DATA ASSIMILATION IN MESOSCALE MODELS

Fred Carr, John Zack (Mesoscale Environmental Simulations and Operations, Inc., Troy, NY.), Jerry Schmidt (National Oceanic and Atmospheric Administration, Boulder, CO.), John Snook (National Oceanic and Atmospheric Administration, Boulder, CO.), Stan Benjamin (National Oceanic and Atmospheric Administration, Boulder, CO.), and David Stauffer (Pennsylvania State Univ., University Park.) *In* NASA. Goddard Space Flight Center, Report of the Proceedings of the Colloquium and Workshop on Multiscale Coupled Modeling Jun. 1993 p 19-23 (For primary document see N94-24374 06-47)
Avail: CASI HC A01/MF A02

The keynote address was the problem of physical initialization of mesoscale models. The classic purpose of physical or diabatic initialization is to reduce or eliminate the spin-up error caused by the lack, at the initial time, of the fully developed vertical circulations required to support regions of large rainfall rates. However, even if a model has no spin-up problem, imposition of observed moisture and heating rate information during assimilation can improve quantitative precipitation forecasts, especially early in the forecast. The two key issues in physical initialization are the choice of assimilating technique and sources of hydrologic/hydrometeor data. Another example of data assimilation in mesoscale models was presented in a series of meso-beta scale model experiments with and 11 km version of the MASS model designed to investigate the sensitivity of convective initiation forced by thermally direct circulations resulting from differential surface heating to four dimensional assimilation of surface and radar data. The results of these simulations underscore the need to accurately initialize and simulate grid and sub-grid scale clouds in meso- beta scale models. The status of the application of the CSU-RAMS mesoscale model by the NOAA Forecast Systems Lab for producing real-time forecasts with 10-60 km mesh resolutions over (4000 km)(exp 2) domains for use by the aviation community was reported. Either MAPS or LAPS model data are used to initialize the RAMS model on a 12-h cycle. The use of MAPS (Mesoscale Analysis and Prediction System) model was discussed. Also discussed was the mesobeta-scale data assimilation using a triply-nested nonhydrostatic version of the MM5 model. Derived from text

MEASUREMENT AND MODELING OF MOIST PROCESSES
William Cotton (Colorado State Univ., Fort Collins.), David Starr, Kenneth Mitchell (National Oceanic and Atmospheric Administration, Washington, DC.), Rex Fleming (National Center for Atmospheric Research, Boulder, CO.), Steve Koch, Steve Smith (National Oceanic and Atmospheric Administraion, Fort Collins, CO.), Jocelyn Mailhot (Recherche en Prevision Numerique, Dorval, Quebec.), Don Perkey (Drexel Univ., Philadelphia, PA.), and Greg Tripoli (Wisconsin Univ., Madison.) *In its* Report of the Proceedings of the Colloquium and Workshop on Multiscale Coupled Modeling Jun. 1993 p 23-26 (For primary document see N94-24374 06-47)
Avail: CASI HC A01/MF A02

The keynote talk summarized five years of work simulating observed mesoscale convective systems with the RAMS (Regional Atmospheric Modeling System) model. Excellent results are obtained when simulating squall line or other convective systems that are strongly forced by fronts or other lifting mechanisms. Less highly forced systems are difficult to model. The next topic in this colloquium was measurement of water vapor and other constituents of the hydrologic cycle. Impressive accuracy was shown measuring water vapor with both the airborne DIAL (Differential Absorption Lidar) system and the the ground-based Raman Lidar. NMC's plans for initializing land water hydrology in mesoscale models was presented before water vapor measurement concepts for GCIP were discussed. The subject of using satellite data to provide mesoscale moisture and wind analyses was next. Recent activities in modeling of moist processes in mesoscale systems was reported on. These modeling activities at the Canadian Atmospheric Environment Service (AES) used a hydrostatic, variable-resolution grid model. Next the spatial resolution effects of moisture budgets was discussed; in particular, the effects of temporal resolution on heat and moisture budgets for cumulus parameterization. The conclusion of this colloquium was on modeling scale interaction processes.

The current model capabilities in the context of land surface interactions with the atmosphere include only one-dimensional characteristics of vegetation and soil surface heat, moisture, momentum, and selected other trace gas fluxes (e.g., CO2). The influence of spatially coherent fluxes that result from landscape heterogeneity were not included. Valuable representations of several aspects of the landscape pattern currently exist. These include digital elevation data and measures of the leaf area index (i.e., Normalized Difference Vegetation Index (NDVI) from Advanced Very High Resolution Radiometer (AVHRR) data). A major deficiency, however, is the lack of an ability to sample spatially representative shallow and (especially) deep soil moisture. Numerous mesoscale modeling and observed studies demonstrated the sensitivity of planetary boundary layer structure and deep convection to the magnitude of the surface moisture flux. Author (revised)

SESSION ON MODELING OF RADIATIVE TRANSFER PROCESSES
Piotr Flatau *In* NASA. Goddard Space Flight Center, Report of the Proceedings of the Colloquium and Workshop on Multiscale Coupled Modeling Jun. 1993 p 71-72 (For primary document see N94-24374 06-47)
Avail: CASI HC A01/MF A02

The session on modeling of radiative transfer processes is reviewed. Six critical issues surfaced in the discussion concerning scale-interactive radiative processes relevent to the mesoscale convective systems (MCS's). These issues are the need to expand basic knowledge of how MCS's influence climate through extensive cloud shields and increased humidity in the upper troposphere; to improve radiation parameterizations used in mesoscale and General Circulation Model (GCM) models; to improve our basic understanding of the influence of radiation on MCS dynamics due to diabatic heating, production of condensate, and vertical and horizontal heat fluxes; to quantify our understanding of radiative impacts of MCS's on the surface and free atmosphere energy budgets; to quantify and identify radiative and microphysical processes important in the evolution of MCS's; and to improve the capability to remotely sense MCS radiative properties from space and ground-based systems. SESSION ON COUPLED ATMOSPHERIC/CHEMISTRY COUPLED MODELS
Anne Thompson *In its* Report of the Proceedings of the Colloquium and Workshop on Multiscale Coupled Modeling Jun. 1993 p 72-77 (For primary document see N94-24374 06-47)
Avail: CASI HC A02/MF A02

The session on coupled atmospheric/chemistry coupled models is reviewed. Current model limitations, current issues and critical unknowns, and modeling activity are addressed. Specific recommendations and experimental strategies on the following are given: multiscale surface layer - planetary boundary layer - chemical flux measurements; Eulerian budget study; and Langrangian experiment. Nonprecipitating cloud studies, organized convective systems, and aerosols - heterogenous chemistry are also discussed. CASI

SESSION ON VALIDATION OF COUPLED MODELS
Bill Kuo *In* NASA. Goddard Space Flight Center, Report of the Proceedings

of the Colloquium and Workshop on Multiscale Coupled Modeling Jun. 1993 p 77-79 (For primary document see N94-24374 06-47)
Avail: CASI HC A01/MF A02

The session on validation of coupled models is reviewed. The current use of a mesoscale model with a grid size of 20-km during STORM-FEST in 1992 has proven to be extremely valuable. The availability of forecast products at a much higher temporal and spatial resolution was very helpful for mesoscale forecasting, mission planning, and the guidance of research aircraft. Recent numerical simulation of ocean cyclones and mesoscsle convective systems using nonhydrostatic cloud/mesoscale models with a grid size as small as 2-km have demonstrated the potential of these models for predicting mesoscale convective systems, squall lines, hurricane rainbands, mesoscale gravity waves, and mesoscale frontal structures embedded within an extratropical cyclone. Although mesoscale/cloud scale models have demonstrated strong potential for use in operational forecasting, very limited quantitative evaluation (and verification) of these models were performed. As a result, the accuracy, the systematic biases, and the useful forecasts limits were not properly defined for these models. Also, no serious attempts were made to use these models for operational prediction of mesoscale convective systems. Author (revised)

SESSION ON TECHNIQUES AND RESOURCES FOR STORM-SCALE NUMERICAL WEATHER PREDICTION
Kelvin Droegemeier *In* NASA. Goddard Space Flight Center, Report of the Proceedings of the Colloquium and Workshop on Multiscale Coupled Modeling Jun. 1993 p 79-112 (For primary document see N94-24374 06-47)
Avail: CASI HC A03/MF A02

The session on techniques and resources for storm-scale numerical weather prediction are reviewed. The recommendations of this group are broken down into three area: modeling and prediction, data requirements in support of modeling and prediction, and data management. The current status, modeling and technological recommendations, data requirements in support of modeling and prediction, and data management are addressed. Derived from text

OBSERVATIONAL AND MODELING STUDIES OF HEAT, MOISTURE, PRECIPITATION AND GLOBAL-SCALE CIRCULATION PATTERNS Final Technical Report, 20 Jul. 1990 - 19 Jan. 1994
Dayton G. Vincent 19 Jan. 1994 8 p
(Grant NAG8-836)
(NASA-CR-195148; NAS 1.26:195148) Avail: CASI HC A02/MF A01

This research grant was a revised version of an original proposal. The period of the grant was for three years with a six-month no-cost extension; thus, it was from 20 July 1990 to 19 January 1994. The objectives of the grant were to identify periods and locations of active convection centers, primarily over the Southern Hemisphere tropical Indian and Pacific Oceans; determine reasons for any periodic behavior found in the first objective; identify cases where subtropical jets over the South Pacific persisted for several days and examine the influences of tropical versus extra-tropical mechanisms in maintaining them; obtain estimates of precipitation by Q(sub 1) and Q(sub 2) budgets, including the importance of terms in each of the respective budgets, and compare these estimates to those obtained by other methods; and diagnose the distributions of moisture and precipitable water over the North Atlantic Ocean using routine analyses and satellite microwave data. To accomplish these objectives, we used grant funds to purchase several data sets, including the Global Precipitation Climate Project (GPCP) observations of station precipitation, ECMWF WCRP/TOGA archive two analyses for January 1985 - December 1990, ECMWF WMO analyses for January 1980 - December 1987, and OLR data for July 1974 - December 1991. We already had some SSM/I data and GLA analyses from a previous grant. In addition, to improve our computing power, we also used grant funds to purchase an IBM PS/2 with accessories, a NEC laser jet printer, and a microcomputer system for word processing. This report is organized as follows. Our research team is listed first. Section two contains a summary of our significant accomplishments; however, a detailed discussion of research results is not included since this information can be found in the accompanying reprints and preprints. Section three offers some concluding remarks, and a complete bibliographic summary is given in Section four. Derived from text

FURTHER STUDIES TO EXTEND AND TEST THE AREA-TIME-INTEGRAL TECHNIQUE APPLIED TO SATELLITE DATA Semiannual Status Report, 1 Jul. - 31 Dec. 1993
Paul L. Smith and Thomas H. VonderHaar (ASTeR, Inc., Fort Collins, CO.) 1993 10 p
(Grant NAG5-386)
(NASA-CR-195132; NAS 1.26:195132) Avail: CASI HC A02/MF A01

The principal goal of this project is to establish relationships that would allow application of area-time integral (ATI) calculations based upon satellite data to estimate rainfall volumes. The research has been pursued using two different approaches, which for convenience can be designated as the 'fixed-threshold approach' and the 'variable-threshold approach'. In the former approach, an attempt is made to determine a single temperature threshold in the satellite infrared data that would yield ATI values for identifiable cloud clusters which are most closely related to the corresponding rainfall amounts. Results thus far have indicated that a strong correlation exists between the rain volumes and the satellite ATI values, but the optimum threshold for this relationship seems to differ from one geographic location to another. The difference is probably related to differences in the basic precipitation mechanisms that dominate in the different regions. The average rainfall rate associated with each cloudy pixel is also found to vary across the spectrum of ATI values. Work on the second, or 'variable-threshold', approach for determining the satellite ATI values was essentially suspended during this period due to exhaustion of project funds. Most of the ATI work thus far has dealt with cloud clusters from the Lagrangian or 'floating-target' point of view. For many purposes, however, the Eulerian or 'fixed-target' perspective is more appropriate. For a very large target area encompassing entire cluster life histories, the rain volume-ATI relationship would obviously be the same in either case. The important question for the Eulerian perspective is how small the fixed area can be made while maintaining consistency in that relationship. Derived from text

ASR-9 MICROBURST DETECTION ALGORITHM Project Report
O. J. Newell and J. A. Cullen 22 Oct. 1993 68 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DTFA01-89-Z-0203)
(AD-A273591; ATC-197; DOT/FAA/NR-93/2) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The ASR-9 Wind Shear Processor (WSP) is intended as an economical alternative for those airports that have not been slated to receive a Terminal Doppler Weather Radar(TDWR) but have, or will be receiving, an ASR-9 radar. Lincoln Laboratory has developed a prototype ASR-9 WSP system which was demonstrated during the summer months of the past three years in Orlando, Florida. During the operational test period, microburst and gust front warnings, as well as storm motion indications, were provided to the Air Traffic Control in real time. The ASR-9 Microburst Detection Algorithm (AMDA) is based on the earlier TDWR Microburst Detection Algorithm, but has been substantially modified to better match the particular strengths and weaknesses of the ASR-9 rapid-scanning fan-beam radar. The most significant additions included a capability to detect overhead microbursts, a reflectivity processing step used to help detect velocity signatures that have been biased by overhanging precipitation, and a modification to some of the shear segment grouping and thresholding parameters to accommodate better the typical on-air siting of the ASR-9. In addition, the AMDA has been designed to be as efficient as possible to allow it to run at the radar's 4.8 seconds/scan antennas rotation rate on a single-board computer. A detailed description of AMDA, as well as the performance evaluation strategy and results, are presented in this report. DTIC

OBSERVED AND NAVY OPERATIONAL GLOBAL MODEL CLIMATOLOGIES OF SYNOPTIC DISTURBANCES OVER THE TROPICAL WESTERN PACIFIC DURING WINTER 1991-1992 Final Report, Oct. 1992 - Oct. 1993

C.-P. Chang and Liana Zambresky Oct. 1993 111 p
(AD-A273400; NPS-MR-93-003) Avail: CASI HC A06/MF A02

This study compares the structure and characteristics of tropical synoptic timescale wave disturbances over the western Pacific, particularly around the Caroline Islands where six upper air stations are present, as contained in radiosonde observations and the initial analysis (tau00) and 48-h forecast (tau48) of the Navy Operational Global Atmospheric Prediction System (NOGAPS) during northern winter of 1991-1992. The observed, analyzed and forecast disturbance climatologies are all determined from power spectral and cross-spectral analyses focusing on the synoptic frequency band encompassing three adjacent period points: 4.6-, 5.3-, and 6.4-day. The meridional wind at 850 hPa is used as the principal parameter for defining the disturbances. The power spectra of the NOGAPS tau00 analysis agree reasonably closely with the radiosonde observations, but the tau48 forecast shows larger differences. Nevertheless, the observed horizontal structure of the disturbances are all well represented in both the analysis and the forecast at all levels. These include the westward propagation, a 850 hPa wavelength near 33 deg along 10 deg N and near 38 deg along the equator, a 200 hPa wavelength near 50-60 deg, and a northeast-southwest meridional tilt. In general, the analysis and the forecast produce a higher spatial coherency than that shown from the radiosonde observations.

AN AVHRR CLOUD CLASSIFICATION DATABASE TYPED BY EXPERTS Final Report

C. L. Crosiar Oct. 1993 31 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DA Proj. X15-96)
(AD-A273560; NRL/MR/7531-93-7207) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The primary objective of this project was to utilize satellite-data from the NOAA Advanced Very High Resolution Radiometer (AVHRR) sensor and the satellite data interpretation knowledge of experts to develop environmental algorithms for the Navy. This objective was met by the design and implementation of software to extract information from the experts and the satellite sensor images, e.g., cloud type, five channels of spectral data, and three textural parameters. The experts classified clouds over seven regions in the Northern Hemisphere covering a one year period. Although these data will be used to develop a tactical algorithm to automatically classify clouds by type, the agreement among experts will help to form a baseline for the developed objective technique. WIND CLIMATE AND URBAN GEOMETRY Ph.D. Thesis

Marcel Bottema 1993 223 p
(ISBN-9-03-860132-8; ETN-94-95350) Copyright Avail: CASI HC A10/MF A03

A study to analyze and supplement existing knowledge of prediction of wind comfort, and to communicate the results to architects and town planners by means of either verbal or graphical design rules, is presented. This aim can be summarized with the words 'technology transfer'. Outdoor climate and its incorporation into the design process is discussed. Theories of boundary layer meteorology and obstacle aerodynamics are presented. Measuring and numerical simulation techniques are discussed. Wind climate at the considered site is mainly dependent on the wind amplification factor, with contribution on three different scale levels: surrounding terrain; building and building group; details of site. Each of these contributions are discussed. Distributions of discomfort probability around buildings are presented. An example of wind comfort evaluation is given. Development of a town plan at a windy location in Amsterdam (Netherlands) is described, as well as cooperation between the architect and the wind expert. Rules of thumb for design are presented. ESA

THE EVALUATION OF ASOS FOR THE KENNEDY SPACE CENTER'S SHUTTLE LANDING FACILITY Final Report

Ann Yersavich, Mark Wheeler, Gregory Taylor, Robin Schumann, and John Manobianco Mar. 1994 66 p
(Contract NAS10-11844)
(NASA-CR-195685; NAS 1.26:195685; Rept-94-001) Avail: CASI HC A04/MF A01

This report documents the Applied Meteorology Unit's (AMU) evaluation of the effectiveness and utility of the Automated Surface Observing System (ASOS) in terms of spaceflight operations and user requirements. In particular, the evaluation determines which of the Shuttle Landing Facility (SLF) observation requirements can be satisfied by ASOS. This report also includes a summary of ASOS' background, current configuration and specifications, system performance, and the possible concepts of operations for use of ASOS at the SLF. This evaluation stems from a desire by the Air Force to determine if ASOS units could be used to reduce the cost of SLF meteorological observations. Derived from text

LITERATURE STUDY ON: REMOTE FRAUNHOFER LUMINESCENCE DETECTION OF ALGAL BLOOM IN MARINE ENVIRONMENTS

W. M. terKuile (Organisatie voor Toegepast Natuurwetenschappelijk Onderzoek, Delft, Netherlands.) Jun. 1993 56 p In ENGLISH and DUTCH Sponsored by Beleidscommissie Remote Sensing, Delft, Netherlands

(BCRS-92-25; TNO-IMW-R-92/396; ISBN-9-05-411070-8; ETN-94-95038) Avail: CASI HC A04/MF A01

Results of literature survey on passive remote sensing of fluorescence of algae on the dark (Fraunhofer) absorption lines in the spectrum of the Sun are reported. The Fraunhofer Line Detector (FLD) and the second generation instrument FLD 2 which was provided with a linear scanner and used as a remote sensing imager, are described. The use of the FLD for remote sensing of environmental pollutants is described. Fluorescence spectra of two known noxious algae types were measured in a fluorescence spectrometer. One of the maxima of each of these spectra appears to coincide with a Fraunhofer line very well. It is demonstrated that the fluorescence of algae containing phycocyane can be detected with high sensitivity. The investigation of the measurement of the phycocyane and chlorophyll ratio by means of the FLD technique is recommended. For water quality management this ratio is a relevant parameter. The FLD technique might provide a highly suitable method for this purpose. ESA

SeaWIFS TECHNICAL REPORT SERIES. VOLUME 9: THE SIMULATED SeaWIFS DATA SET, VERSION 1

Watson W. Gregg, Frank C. Chen (General Sciences Corp., Laurel, MD.), Ahmed L. Mezaache (General Sciences Corp., Laurel, MD.), Judy D. Chen (General Sciences Corp., Laurel, MD.), Jeffrey A. Whiting (General Sciences Corp., Laurel, MD.), Stanford B. Hooker, ed., Elaine R. Firestone, ed. (General Sciences Corp., Laurel, MD.), and A. W. Indest, ed. (General Sciences Corp., Laurel, MD.) Washington May 1993 19 p

(NASA-TM-104566-Vol-9; NAS 1.15:104566-Vol-9; Rept-93B00086-Vol-9) Avail: CASI HC A03/MF A01

Data system development activities for the Sea-viewing Wide Field-of-view Sensor (SeaWiFS) must begin well before the scheduled 1994 launch. To assist in these activities, it is essential to develop a simulated SeaWiFS data set as soon as possible. Realism is of paramount importance in this data set, including SeaWiFS spectral bands, orbital and scanning characteristics, and known data structures. Development of the simulated data set can assist in identification of problem areas that can be addressed and solved before the actual data are received. This paper describes the creation of the first version of the simulated SeaWiFS data set. The data set includes the spectral band, orbital, and scanning characteristics of the SeaWiFS sensor and SeaStar spacecraft. The information is output in the data structure as it is stored onboard. Thus, it is a level-0 data set which can be taken from start to finish through a prototype data system. The data set is complete and correct at the time of printing, although the values in the telemetry fields are left blank. The structure of the telemetry fields, however, is incorporated. Also, no account for clouds has been included. However, this version facilitates early prototyping activities by the SeaWiFS data system, providing a realistic data set to assess performance. Author

SeaWIFS TECHNICAL REPORT SERIES. VOLUME 11: ANALYSIS OF SELECTED ORBIT PROPAGATION MODELS FOR THE SeaWIFS MISSION

Frederick S. Patt (General Sciences Corp., Laurel, MD.), Charles M. Hoisington (Science Systems and Applications, Inc., Lanham, MD.), Watson W. Gregg, Patrick L. Coronado, Stanford B. Hooker, ed., Elaine R. Firestone, ed. (General Sciences Corp., Laurel, MD.), and A. W. Indest, ed. (General Sciences Corp., Laurel, MD.) Jun. 1993 18 p

(NASA-TM-104566-Vol-11; NAS 1.15:104566-Vol-11; Rept-93B00097-Vol-11) Avail: CASI HC A03/MF A01

An analysis of orbit propagation models was performed by the Mission Operations element of the Sea-viewing Wide Field-of-View Sensor (SeaWiFS) Project, which has overall responsibility for the instrument scheduling. The orbit propagators selected for this analysis are widely available general perturbations models. The analysis includes both absolute accuracy determination and comparisons of different versions of the models. The results show that all of the models tested meet accuracy requirements for scheduling and data acquisition purposes. For internal Project use the SGP4 propagator, developed by the North American Air Defense (NORAD) Command, has been selected. This model includes atmospheric drag effects and, therefore, provides better accuracy. For High Resolution Picture Transmission (HRPT) ground stations, which have less stringent accuracy requirements, the publicly available Brouwer-Lyddane models are recommended. The SeaWiFS Project will make available portable source code for a version of this model developed by the Data Capture Facility (DCF). Author

GLOBAL OCEAN MODELING ON THE CONNECTION MACHINE

R. D. Smith, J. K. Dukowicz, and R. C. Malone 1993 4 p Presented at the 5th Annual Symposium on Global Change Studies, Nashville, TN, 24-28 Jan. 1994

(Contract W-7405-eng-36)

(DE94-000888; LA-UR-93-3327; CONF-940131-1) Avail: CASI HC A01/MF A01

The authors have developed a version of the Bryan-Cox-Semtner ocean model for massively parallel computers. Such models are three-dimensional Eulerian models that use latitude and longitude as the horizontal spherical coordinates and fixed depth levels as the vertical coordinate. The incompressible Navier-Stokes equations, with a turbulent eddy viscosity, and mass continuity equation are solved, subject to the hydrostatic and Boussinesq approximations. The traditional model formulation uses a rigid-lid approximation (vertical velocity = 0 at the ocean surface) to eliminate fast surface waves. These waves would otherwise require that a very short time step be used in numerical simulations, which would greatly increase the computational cost. To solve the equations with the rigid-lid assumption, the equations of motion are split into two parts: a set of two-dimensional 'barotropic' equations describing the vertically-averaged flow, and a set of three-dimensional 'baroclinic' equations describing temperature, salinity and deviations of the horizontal velocities from the vertically-averaged flow. DOE

(BCRS-93-04; ISBN-9-05-411079-1; ETN-94-95040) Avail: CASI HC A04/MF A01

The feasibility of deriving current profile data surface current observations in stratified flow conditions was investigated. Based on historical in situ current measurements, attempts were made to describe the current profile by mathematical modeling. It was concluded that it is possible to reconstruct current profiles in the test area by using a relatively simple hydrodynamic model and surface current field data. This reconstruction can be improved by using online data from the scheduled fixed Acoustic Doppler Current Profiler (ADCP) in the Maasmond area. Due to the firm physical basis of the proposed approach it can be expected that the model can be applied under a wide range of hydrodynamic conditions without excessive efforts in calibration and empirical modeling. As certain components of the model still need to be calibrated on a suitable data set it is recommended that we proceed with a validation campaign. This should involve VHF/HF radar measurements combined with inverse current modeling, together with simultaneous reference measurements to verify the overall feasibility of such a current information system. It is also recommended that we use this campaign to demonstrate the current information system to the future users in a quasi operational environment. ESA

RECENT DEVELOPMENTS IN THE MATHEMATICAL MODELLING AND PHYSICAL UNDERSTANDING OF TRANSPORT AND DISPERSION IN AQUATIC SYSTEMS, WITH SPECIAL REFERENCE TO TIDAL WATERS
G. C. vanDam 9 Mar. 1993 146 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-111135) Avail: Issuing Activity (National Technical Information Service (NTIS))

In the discussion of mathematical modeling and computer simulation, the main subject will be the application of model particles (tracers) directly corresponding with dissolved, suspended and deposited particles in nature. Emphasis will be on modeling in three spatial dimensions so as to be able to account for the main physical mechanisms explicitly. Attention will be paid to the interaction between model simulations and insight in mechanisms and, in this connection, to the role of field observations. Results will be shown relating to the North Sea and Dutch estuaries, with reference to practical applications, plans and perspectives. NTIS

In the last fifty years the riverine phosphorus and nitrogen loads discharged into the North Sea have increased considerably. Extensive oxygen deficiencies in the German Bight and the increase in phytoplankton and shifts in its species composition have been attributed to eutrophication. From 1988-1990 the effects of eutrophication on the oxygen economy, primary production, phytoplankton species composition, biomass and the principal limiting factors throughout the North Sea were studied in the EUZOUT project. The data generated in this project were used for the report. The report describes the results of methods for the detection of nutrient stress to samples taken from the coastal and central North Sea in 1988, 1989 and 1990 during the EUZOUT project. NTIS

AN EFFICIENT DATA ASSIMILATION ALGORITHM WITH A GAUSSIAN COVARIANCE STRUCTURE
Ranjit M. Passi, Kent Goodrich, John C. Derber, and Mark Limber Oct. 1993 44 p
(Contract N00014-92-J-4112)
(AD-A273152; COAM-TR-2/94) Avail: CASI HC A03/MF A01

Details are provided of our attempts to develop computationally efficient and widely acceptable data assimilation algorithms. Our initial data assimilation work was done with a scheme which was developed by Derber and Rosati (1989) for their global data assimilation application. The scheme is quite efficient; however, when it was combined with a primitive equation, numerical model of the Gulf of Mexico, the nowcasting step took too much computer time for it to be useful in real-time applications. So, after an initial implementation and test of the scheme, our obvious thrust was to enhance and make it more efficient. Most of the computation resources while using the Derber-Rosati scheme are required in approximating a matrix product Sigma-mg, where Sigma-m is the covariance matrix of the model output error having a Gaussian spatial covariance structure that stays fixed, and g is a varying vector. They approximate this product by repeated application of a Laplacian operator. A new algorithm is developed that, while maintaining the accuracy, approximates Sigma-mg far more efficiently than the Laplacian algorithm. It also admits a wider class of covariance structures with equal ease and efficiency. The new algorithm approximates Sigma-mg by applying a product of two operators that are polynomials in simple averaging operators. The algorithm is efficient and general with the only restriction that Sigma-m be based on a covariance function that is a product of factors, which are even functions in a single dimension. DTIC

GLOBAL ACOUSTIC MAPPING OF OCEAN TEMPERATURES (GAMOT) Quarterly Progress Report No. 2, 1 Jul. - 30 Sep. 1993
John L. Spiesberger 15 Oct. 1993 66 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract MDA972-93-1-0004)
(AD-A273387) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Work continues on all GAMOT tasks as described in ARPA Grant No: MDA972-93-1-0004 and remains on schedule with the exception of tasks C and D. Task C work is behind schedule and there will be a delay in the initial deployment of the operational SSARs of approximately six weeks. Task D, the autonomous mooring, is behind schedule and the total delay cannot be calculated until the impact of the increased scope of Task D, which now includes procurement of a 70 Hz source, can be determined. Task A involves the success of ray theory in identifying multipaths arrivals at basin scales. Task B tasks and deliverables are on schedule. Remote forced NE Pacific (NEP) model runs have been completed for 1961-1991 driven by equatorial Kelvin waves. Rossby waves propagating off the coast are shown to significantly alter acoustic travel times. All elements of the SSAR development are underway and on schedule. The initial SSAR prototype test deployment was conducted. Guidelines for the scope of task D include: trequency of the source will be 70 Hz; the schedule could be extended to accommodate the additional engineering and source procurement lead time; and consider both m-sequence and FM coding sources. As part of the SYNOP (Synoptic Ocean Prediction experiment) field program, twelve tall moorings measured the Gulf Stream's temperature and velocity fields with current meters (CM) at nominal depths of 400 m, 700 m, 1000 m, and 3500 m for two years, from May 1988 through August 1990. Simultaneously, 24 inverted echo sounders (IES) monitored the thermocline topography. A third observational component of the experiment was the release of isopycnal RAFOS floats; 70 such floats traversed the area monitored by the CM and the IES. This report documents the methods used to compute vertical motion for each data source, and the differences and similarities between the three methods. Typical velocities during 'strong' events, as observed by or inferred from all three instruments, was 1-2 mm/s in regions near the center of the Gulf Stream. The comparison of RAFOS vertical motions and vertical motions diagnosed from CM data showed excellent agreement; furthermore, CM vertical motions and IES vertical motions are statistically coherent for periods longer than 12 days. We conclude that we may map mesoscale fields of w(x,y,t); the fields mapped are consistent with quasi-geostrophic dynamics. DTIC

EXAMINATION OF THE PHYSICAL, ELECTRICAL, AND MICROWAVE EVOLUTION OF WATER INTO YOUNG SEA ICE Final Report, 1 Sep. - 28 Feb. 1993
Robert G. Onstott Nov. 1993 59 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-92-C-0140)
(AD-A273559; ERIM-248500-1-F) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Knowledge of the interrelationships between ice thickness, its temperature profile, the distribution of salinity, the dielectric property profile, and the roughness of the air-ice interface is important to the understanding of the backscatter response of new and young sea ice. Backscatter, physical, and electrical property measurements were made during the first 120 hours of growth for a saline ice sheet grown in an outdoor laboratory tank. The purpose of this work is to describe the evolution of open water to ice 15 cm thick. Ambient air temperatures were -15 C during the critical growth period to 10 cm and then warmed to 10 C during the final 5 cm of growth. Radar backscatter data were obtained at 5.3, 9.6, 13.6, and 16.6 GHz to correlate with the changes in the microwave signatures with ice thickness, ice surface temperature, the salinity profile, the dielectric profile, and modifications which occur naturally to the air-ice interface of the ice sheet. Linear antenna transmit-receive polarizations were used and include vertical-vertical and horizontal-horizontal. Angle of incidence scans were made from vertical to 50 deg. The change in the backscatter response with changing ice thickness is documented and discussed in terms of the physical-chemical-electrical property changes. DTIC

USE OF MICROWAVE POLARIMETRY TO ENHANCE SAR IMAGES OF THE OCEAN SURFACE Final Report
Robert E. McIntosh Sep. 1993 51 p
(Contract N00014-89-J-3230)
(AD-A273568) Avail: CASI HC A04/MF A01

The goal of this study is the investigation of coherent backscatter of microwave signals from the ocean surface to better understand the effects of surface motion on synthetic aperture radar images. The objective is to analyze the behavior of coherent electromagnetic backscatter from the ocean surface for a dual frequency, dual polarization radar. Frequency and polarization diversity provides a picture of the mechanisms involved in the microwave backscatter. In this study, data was obtained from various University of Massachusetts radar systems to obtain extensive radar observations of the ocean surface at the FPN research tower in the North Sea, Germany. NATIONAL ACADEMY OF SCIENCES-ACADEMY OF SCIENCES OF THE USSR WORKSHOP ON THE MECHANICS OF ICE AND ITS APPLICATIONS
Wilford F. Weeks 1993 91 p Workshop held in Moscow and Leningrad, Russia, 6-21 Jun. 1991
(Contract N00014-91-J-4134)
(AD-A273338) Avail: CASI HC A05/MF A01

The United States and the former Soviet Union have strong common interests in obtaining a better understanding of the behavior of ice at all scales. In particular, Russia and the United States have vast resources in the North, notably off the shelves of Alaska and Siberia. In order to safely and economically exploit these resources, both countries require an in-depth understanding of the movement of the ice cover, the forces which moving ice can exert against bottom founded structures, and the ice resistance on vessels used to transport these resources to market. The goal of the Ice Mechanics Workshop was to facilitate the exchange of technical information between the United States and the Soviet Union. Although specialists in both countries had made great efforts to keep abreast of each other's achievements, the exchange of ice technology between the two countries could be characterized as poor. This was primarily due to language barriers and constraints on communication and distribution of literature. DTIC

REACTIVE TRACE METALS AS INDICATORS OF SUBDUCTION AND VENTILATION PROCESSES IN THE OCEAN Final Report
Chris Measures 24 Nov. 1993 2 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-90-J-1681)
(AD-A273585) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The continuation of the work of this proposal, which was originally proposed to the ONR in 1990, had to be curtailed after the cancellation of the Barents Sea cruise in 1990 and after the P.I. was denied space on the trans-Polar expedition during the summer of 1991. Instead, after consultation with the ONR program manager, the P.I. participated in a cruise designed to use trace elements to survey the hydrothermal plumes generated by sea-floor hydrothermal activity between 9 deg and 11 deg N on the East Pacific Rise. The P.I.'s participation in this cruise was designed to determine the magnitude and variability of dissolved Al enrichment in the hydrothermal plumes which result from the mixing of hydrothermal vent fluids with the overlying sea water. SEAFLOOR CHARACTERIZATION/GALAPAGOS PROPAGATING RIFT Final Report
Martin C. Kleinrock, Peter R. Shaw, and Deborah K. Smith 18 Oct. 1993 4 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-89-J-1021)
(AD-A273586) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Our goal is to better understand the system that produces the oceanic crust. Because the seafloor is a product of this system, we believe that fundamental insight can be gained through the study of seafloor topography and the spatial variation in its characteristics. Our project has focused on applying and further developing our techniques for analyzing seafloor topography and combining our techniques for seafloor characterization with other data sources (e.g., seismicity) and models. ANALYSIS OF MODAL EVOLUTION CAUSED BY A WEAKLY RANGE-DEPENDENT SEABED IN SHALLOW WATER AND ITS APPLICATION TO INVERSION FOR GEOACOUSTIC PROPERTIES Ph.D. Thesis
Kazuhiko Ohta Sep. 1993 266 p
(Contract N00014-91-J-1379)
(AD-A273656; WHOI-93-35) Avail: CASI HC A12/MF A03

In a shallow water ocean environment, the range-dependent variation of the geoacoustic properties of the seabed is one of the crucial factors affecting sound propagation. Since the local modes of propagation depend on the spatial changes in the bottom sediments, the local eigenvalues of these modes are useful as tools for examining the range dependence of the sediment properties. In order to extract the local eigenvalues from measurements of the pressure field in a laterally inhomogeneous waveguide, the zero-order asymptotic Hankel transform with a short sliding window is utilized. The local peak positions in the output spectra differ from the local eigenvalues due to both the range variation of the local modes and the interference of adjacent modes. The departure due to the former factor is evaluated analytically by using the stationary phase method. In order to reduce the error induced by the latter factor, mode filtering is utilized by incorporating data from a fixed vertical array of receivers. The use of the above zero-order Hankel transform in a three-dimensionally varying waveguide results in an underestimate of the local eigenvalues due to the effect of horizontal refraction. Thus a general asymptotic Hankel transform with a two dimensional sliding window is used to correct for the underestimated amount. By expanding the latter transform with respect to the azimuthal angle, it can also be shown that the first term in the Taylor series corresponds to the former transform; the rest of the terms account for the value difference between the underestimated and actual local eigenvalues. INCREASING ACCURACY IN THE ASSESSMENT OF MOTION SICKNESS: A CONSTRUCT METHODOLOGY

Cynthia S. Stout and Patricia S. Cowings Dec. 1993 17 p
(RTOP 199-70-12-14)
(NASA-TM-108797; A-94014; NAS 1.15:108797) Avail: CASI HC A03/MF A01

The purpose is to introduce a new methodology that should improve the accuracy of the assessment of motion sickness. This construct methodology utilizes both subjective reports of motion sickness and objective measures of physiological correlates to assess motion sickness. Current techniques and methods used in the framework of a construct methodology are inadequate. Current assessment techniques for diagnosing motion sickness and space motion sickness are reviewed, and attention is called to the problems with the current methods. Further, principles of psychophysiology that when applied will probably resolve some of these problems are described in detail. Author (revised)

(DE93-041166; ANL/MCS/CP-80305; CONF-9310172-1) Avail: CASI HC A03

We describe an investigation into the use of the Aurora parallel Prolog system in two applications within the area of computational molecular biology. The computational requirements were large, due to the nature of the applications, and were carried out on a scalable parallel computer, the BBN 'Butterfly' TC-2000. Results include both a demonstration that logic programming can be effective in the context of demanding applications on large-scale parallel machines and some insights into parallel programming in Prolog. [INVESTIGATION OF EVOLUTION-RELATED ASPECTS OF BACTERIAL RHODOPSINS] Final Report

19 Jan. 1994 4 p
(Grant NAGw-212)
(NASA-CR-194826; NAS 1.26:194826) Avail: CASI HC A01/MF A01

We have investigated evolution-related aspects of bacterial rhodopsins, the unique retinal-based energy transducing systems of halophilic archae. The approach was to describe both structural and functional aspects: the structure by sequencing genes to explore which regions are conserved, and the function by comparing proton and chloride transport in the closely related systems, bacteriorhodopsin and halorhodopsin, respectively. In the latter, we have made a good start toward the ultimate goal of separating the attributes of the general principles of retinal-based ionic pumps from those of the specific ion specificities, by determining the thermodynamics of the internal steps of the protein-mediated active transport process, as well as some of the intraprotein ion-transfer steps. Our present emphasis is on continuing to acquire the tools for studying what distinguishes proton transport from chloride transport. We consider it important, therefore, that we have been able to provide firm mathematical grounds for the kinetics analyses which underlies these studies. Our molecular biological studies have received a great boost from the expression vector for the bop gene based on a halobacterial plasmid, that we recently developed. Derived from text

THE COMPUTATION OF R(SUB 0) FOR DISCRETE-TIME EPIDEMIC MODELS WITH DYNAMIC HETEROGENEITY

M. C. M. DeJong (CDI, Lelystad, Netherlands.), O. Diekmann (Leiden Univ., Netherlands.), and J. A. P. Heesterbeek Jan. 1993 20 p
(CWI-AM-R9301; ETN-94-94712) Copyright Avail: CASI HC A03/MF A01

An explicit algorithm for the computation of the basic reproduction ratio R(sub 0) for a class of discrete time epidemic models is given. These models allow for a finite number of different individual types, type changes at fixed time dependent intervals, arbitrary contact intensity between individuals of the various types and variable infectivity. The models reflect the situation where an infectious disease spreads in a population of animals that are reared in different stables on farms. It is shown analytically that R(sub 0) depends, for any given type, on the product of the susceptibility and the total infectivity of that type and not on these factors separately. This product is called the transmission weight of the type. The maximum overall transmission weights gives an upper bound for R(sub 0), irrespective of the particular submodels for type change and contact structure. Therefore, reduction of all transmission weights below one, by vaccination or some other control measure, will result in R(sub 0) less than 1 and will hence lead to eradication of the disease. ESA

MONOCLONAL ANTIBODIES DIRECTED AGAINST SURFACE MOLECULES OF MULTICELL SPHEROIDS Semiannual Status Report, 1 Jul. - 31 Dec. 1993

Andrew O. Martinez 31 Dec. 1993 33 p
(Grant NAG2-819)
(NASA-CR-195102; NAS 1.26:195102) Avail: CASI HC A03/MF A01

The objective of this project is to generate a library of monoclonal antibodies (MAbs) to surface molecules of mammalian tumor and transformed cells grown as multicell spheroids (MCS). These MCS are highly organized, three dimensional multicellular structures which exhibit many characteristics of in vivo organized tissues not found in conventional monolayer or suspension culture; therefore, MCS make better in vitro model systems to study the interactions of mammalian cells. Additionally, they provide a functional assay for surface adhesion molecules. Derived from text

SKELETAL MUSCLE METABOLISM IN HYPOKINETIC RATS Final Technical Report, Jul. 1981 - Dec. 1993

Marc E. Tischler 1993 10 p
(Grants NAGw-227; NAG2-384)
(NASA-CR-195082; NAS 1.26:195082) Avail: CASI HC A02/MF A01

This grant focused on the mechanisms of metabolic changes associated with unweighting atrophy and reduced growth of hind limb muscles of juvenile rats. Metabolic studies included a number of different areas. Amino acid metabolic studies placed particular emphasis on glutamine and branched-chain amino acid metabolism. These studies were an outgrowth of understanding stress effects and the role of glucocorticoids in these animals. Investigations on protein metabolism were largely concerned with selective loss of myofibrillar proteins and the role of muscle proteolysis. These investigations lead to finding important differences from denervation and atrophy and to define the roles of cytosolic versus lysosomal proteolysis in these atrophy models. A major outgrowth of these studies was demonstrating an ability to prevent atrophy of the unweighted muscle for at least 24 hours. A large amount of work concentrated on carbohydrate metabolism and its regulation by insulin and catecholamines. Measurements focused on glucose transport, glycogen metabolism, and glucose oxidation. The grant was used to develop an important new in situ approach for studying protein metabolism, glucose transport, and hormonal effects which involves intramuscular injection of various agents for up to 24 hours. Another important consequence of this project was the development and flight of Physiological-Anatomical Rodent Experiment-1 (PARE-1), which was launched aboard Space Shuttle Discovery in September 1991. Detailed descriptions of these studies can be found in the 30 peer-reviewed publications, 15 non-reviewed publications, 4 reviews and 33 abstracts (total 82 publications) which were or are scheduled to be published as a result of this project. A listing of these publications grouped by area (i.e. amino acid metabolism, protein metabolism, carbohydrate metabolism, and space flight studies) are included. Author

MICROINJECTION OF THE YERSINIA YopE CYTOTOXIN IN MAMMALIAN CELLS INDUCES ACTIN MICROFILAMENT DISRUPTION
Roland Rosqvist, Aake Forsberg, and Hans Wolf-Watz (Umea Univ., Sweden.) 1991 2 p Repr. from Biochemical Society Transactions, v. 19, 1991 p 113-114
(Grants SMRC-07-490-5A; BU-4426-301; STuF-90-005-770)
(FOA-B-40418-4.4; ETN-93-93763) Avail: CASI HC A01

Pathogenic Yersinia possess a common virulence plasmid of about 70 kb in size. Upon incubation at 37 C in the absence of Ca(2+) ions, strains harboring the plasmid stop growing and start producing a number of proteins denoted Yops (Yersinia outer membrane proteins). Results and discussions of an experiment which showed that secreted Yops can induce cytotoxicity in cultured cells if the proteins are delivered inside the cell by microinjection are given. Furthermore, the intracellular target of this cytotoxic effect is essential for maintenance of normal actin microfilament structure. It is concluded that YopE is a cytotoxin which mediates disruption of actin microfilaments, and YopD is involved in the translocation of YopE though the host membrane. ESA

INTERACTION OF TACRINE AT M(1) AND M(2) CHOLINOCEPTORS IN GUINEA PIG BRAIN
Maria Szilagyi and Wai-Man Lau Switzerland S. Karger AG, Basel, Switzerland 1993 7 p Repr. from Pharmacology 1993, v. 47, p 223-229
Copyright Avail: Issuing Activity

Tacrine (THA) actively modulates binding of M(sub 1) ligands in an allosteric fashion causing positive cooperativity. The binding affinity of THA to M(sub 1) and M(sub 2) cholinoceptors is similar. It is therefore proposed that the allosteric selectivity of THA is a function of the binding site and not of THA itself. Its interaction of M(sub 1) and M(sub 2) cholinoceptors was examined in guinea pig brain homogenates using the selective M(sub 1) and M(sub 2) antagonists (3H)-pirenzepine ((3H)PZ) and (3H)AF-DX 384. The dissociation constants were 0.36 nmol/l for the M(sub 1) receptor and 0.23 nmol/l for the M(sub 2) receptor. The binding of THA and methoctramine (MTA) at M2 receptors were also compared. Tacrine displayed similar binding affinity for both M(sub 1) and M(sub 2) receptor subtypes. MTA was 100 times more potent an inhibitor of (3H)AF-DX 384 binding at M(sub 2) receptors than THA. In addition, THA was found to slow the dissociation of (3H)PZ from the M(sub 1) receptor. In contrast, the dissociation of (3H)AF-DX 384 from M(sub 2) receptor subtypes was unaffected. It was concluded that THA acts as an agonist at M(sub 1) cholinoceptors because it slowed the dissociation of (3H)PZ. At M(sub 2) cholinoceptors its nature is that of an antagonist because it had no effect on (3H)AF-DX 384 dissociation. Author (revised)

MICROBIOLOGICAL ANALYSIS OF DEBRIS FROM SPACE TRANSPORTATION SYSTEM (STS)-55 SPACELAB D-2 Final Report
T. L. Huff Jan. 1994 10 p
(Contract NAS8-37814)
(NASA-CR-193883; NAS 1.26:193883) Avail: CASI HC A02/MF A01

Filter debris from the Spacelab module D-2 of STS-55 was analyzed for microbial contamination. Debris from cabin and avionics filters was collected by Kennedy Space Center personnel on May 8, 1993, 2 days postflight. Debris weights were similar to those of previous Spacelab missions. Approximately 5.1E+5 colony forming units per gram of debris were enumerated from the cabin and avionics filter debris, respectively. these numbers were similar in previous missions for which the entire contents were analyzed without sorting of the material. Bacterial diversity was small compared to previous missions, with no gram negative bacteria isolated. Only one bacterial species, Corynebacterium pseudodiphtheriticum, was not isolated previously by the laboratory from Spacelab debris. This organism is a normal inhabitant of the pharynx. A table listing all species of bacteria isolated by the laboratory from previous Spacelab air filters debris collection is provided. Author

IN VITRO SYSTEM FOR STUDYING METABOLISM OF ENVIRONMENTAL CHEMICALS IN HUMAN CELLS Annual Report, 30 Apr. 1992 - 29 Apr. 1993
Carol E. Green 5 Nov. 1993 32 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F49620-91-C-0050)
(AD-A273427; AFOSR-93-0854TR) Avail: CASI HC A03

The objective of the project is to establish and use an in vitro system of intact hepatocytes from rodent and human tissues to develop quantitative data on the metabolism of toxic chemicals that can be used in risk assessments. Currently, two different in vitro models are most frequently used for comparative metabolism studies-isolated hepatocytes and precision-cut liver slices. In the second year of the project, hepatocytes and liver slices from rat and human livers were compared to determine their capability to metabolize chloroform and a model substrate, 7-ethoxycoumarin. The 7-ethoxycoumarin O-deethylation activity of hepatocytes was consistently higher than the activity measured with liver slices, when standardized by protein content of the two preparations. The metabolism of chloroform by hepatocytes isolated from male F344 rats was characterized by analyzing headspace and medium concentrations. The kinetic constants, estimated from the headspace data generated in these experiments, are K. = 34 nmol/flask and V max. = 24 pmol/min/106 cells. Headspace analysis was also useful for determining chloroform metabolism by liver slices. After addition of 3.6 nmol/flask, the rate of chloroform loss was 2.5 pmol/min/mg tissue. DTIC

A BIOLOGICAL SURVEY FOR THE NATION
1993 211 p
(LC-93-85920; ISBN-0-309-04984-0) Copyright Avail: Issuing Activity

The idea of a national biological survey has a long history in the United States. In recent years, increasing concerns about the nation's biological resources have led to calls for a new biological survey. Recently, the process of forming a National Biological Survey (NBS) within the Department of the Interior (DOI) was initiated. A research agenda for the NBS is proposed that is far broader than the existing research effort in DOI but that is also focused according to likely immediate and long-term user needs. A National Biotic Resources Information System is envisioned to make reliable biological information more accessible to diverse users. Also described is how the many public and private entities involved in current research on biological resources can work together in a new entity, which the committee has called the National Partnership for Biological Survey, to provide comprehensive information that will be useful for decision-makers at all levels of government and outside government. SYMBIOSIS IN MARINE LUMINOUS BACTERIA Final Report
Edward G. Ruby 1993 3 p
(Contract N00014-92-J-1716)
(AD-A273540) Avail: CASI HC A01/MF A01

This work indicates that the distribution and abundance of a class of marine microorganisms, the symbiotic luminous bacteria, are controlled by the dynamics of their relationship with their host. Such a conclusion constitutes the first time that the ecology of any marine bacterium could be related to a predictive biological factor. This-study also points to the presence of a significant population of typically culturable V. fischeri cells in seawater that have entered a non-culturable state from which they can be recovered only through an association with a specific animal tissue. Such a phenomenon changes the way we view the initiation of the light organ symbiosis. However, of even broader interest, it suggests that at least a portion of the 99.9% of bacteria in seawater that can not be cultured may not be unknown or new species, but in fact are well-known, typically culturable bacteria that are awaiting a specific environmental cue that signals these cells to re-enter a proliferative stage in their cell cycle.

THE EVOLUTION OF ENERGY-TRANSDUCING SYSTEMS. STUDIES WITH AN EXTREMELY HALOPHILIC ARCHAEBACTERIUM Final Report, Feb. 1989 - Aug. 1992
Helga Stan-Lotter Aug. 1992 11 p
(Contract NCC2-578)
(NASA-CR-193803; NAS 1.26:193803) Avail: CASI HC A03/MF A01

The F-type ATPases are found in remarkably similar versions in the energy-transducing membranes of eubacteria, chloroplasts, and mitochondria. Thus, it is likely that they have originated early in the evolution of life, which is consistent with their function as key enzymes of cellular metabolism. The archaebacteria are a group of microorganisms which, as shown by molecular sequencing and biochemical data, have diverged early from the main line of prokaryotic evolution. From studies of members of all three major groups of archaebacteria - the halophiles, methanogens, and thermoacidophiles - it emerged that they possess a membrane ATPase which differs from the F-ATPases. The goal of this project was a comparison of the ATPase from the halophilic archaebacterium Halobacterium saccharovorum with the well-characterized F-type ATPases on the molecular level. Amino acid sequences of critical regions of the enzyme were to be determined, as well as immunoreactions of single subunits in the search for common epitopes. The results were expected to allow a decision about the nature of archaebacterial ATPases, their classification as one of the known or, alternatively, novel enzyme complexes, and possibly deduction of events during the early evolution of energy-transducing systems.

(Contract NASw-4435)
(NASA-CR-195516; NAS 1.26:195516) Avail: CASI HC A04/MF A01

NASA's Controlled Ecological Life Support System (CELSS) project centers on growing plants and recycling wastes in space. The current version of the biomass production chamber (BPC) uses a hydroponic system for nutrient delivery. To optimize plant growth and conserve system resources, the content of the nutrient solution which feeds the plants must be constantly monitored. The macro-nutrients (greater than ten ppm) in the solution include nitrogen, phosphorous, potassium, calcium, magnesium, and sulphur; the micro-nutrients (less than ten ppm) include iron, copper, manganese, zinc, and boron. The goal of this project is to construct a computer-controlled system of ion detectors that will accurately measure the concentrations of several necessary ions in solution. The project focuses on the use of a sensor array to eliminate problems of interference and temperature dependence.

N-ethylmaleimide (NEM) inhibits the ATPase of H. saccharovorum in a nucleotide protectable manner. The bulk of C-14 NEM is incorporated into subunit one. Cyanogen bromide cleavage of labeled subunit one indicated that NEM bound to a peptide of a Mr of about 8,900. Thus, Cys 262 (H. salinarium numbering) may be the NEM binding site. Cyanogen bromide fragments have been submitted for sequencing. To prove the presence of three Cys residues in subunit one, alkaline cleavage following treatment with NTCB was carried out. Thiol reagents such as p-chloro mercuri phenyl sulfonate also inhibited the ATPase. However, this inhibition was not nucleotide-protectable, suggesting a different location and role for the PCMS-sensitive Cys. The proteolipid which was extracted with chloroform/methanol from the membranes of H. saccharovorum cross-reacted with an antiserum against subunit c (the DCCD-binding protein) of Escherichia coli. Following labeling of membranes from H. saccharovorum with C-14 DCCD under conditions, which inhibited ATP synthesis, the isotope was incorporated into one protein of Mr of about 6,500. Thus, the proteolipid of H. saccharovorum and the DCCD-labeled peptide may be identical. If so, these results suggest that the proteolipid is a component of the membrane sector of an archaeal F-type ATP synthase. Author (revised)

AN EXPLORATORY STOCHASTIC MODEL FOR TOXIC EFFECTS ON CELLS
R. L. Carpenter, D. P. Gaver, and P. A. Jacobs Sep. 1993 81 p
(AD-A273438; NPS-OR-93-104) Avail: CASI HC A05/MF A01

A multivariate dynamic Markov model is formulated to describe the possible effect of a generic chemical toxin on a generic cell population in an organ. Asymptotic methods (large cell population) are used to show that numbers and toxin may be jointly Gaussian/normally distributed; the joint stochastic process is approximately Ornstein-Uhlenbeck. Application to dose-response, and hence risk analysis, is briefly discussed. DTIC

This Lecture Series will update the information presented in the 1987 AGARD Short course on the Cardiopulmonary Aspects of Aerospace Medicine, and will be of primary relevance to military internists and cardiologists with an interest in aviation medicine, and to military Flight Surgeons. Topics to be discussed will include the following: screening to asymptomatic coronary artery disease in an aircrew population; the aeromedical disposition of aviators with coronary disease; the utility of screening aircrew candidates with echocardiography and echocardiographic findings in trained aircrew; etc. The Lecture Series is designed to be interactive rather than strictly didactic to encourage discussion of problems particular to participating NATO countries. For individual titles, see N94-23314 through N94-23328.

In 1987, the AGARD Aeromedical Panel (AMP) sponsored a Short Course on the Cardiopulmonary Aspects of Aerospace Medicine. The aim of the course was to disseminate current information about the aeromedical implications of cardiac and pulmonary conditions to NATO Flight Surgeons. At the time of the first course, it was proposed that an update course be run every five to six years to keep NATO Flight Surgeons abreast of current developments in aviation cardiology and pulmonology. Since the 1987 Lecture Series, there have been a number of new developments in aviation cardiology. The purpose of this Lecture Series is to disseminate this information. Author (revised)

SCREENING FOR ASYMPTOMATIC CORONARY HEART DISEASE
William B. Kruyer *In* AGARD, Cardiopulmonary Aspects in Aerospace Medicine Oct. 1993 5 p (For primary document see N94-23313 06-52)
Copyright Avail: CASI HC A01/MF A01

Predicting the presence of coronary heart disease in an asymptomatic population is a very difficult task. Because of the possible sudden and incapacitating presentation of coronary heart disease and its common occurrence in industrialized nations, screening for this disorder is an important aeromedical concern. Nonsignificant disease can lead to coronary events and is also likely to progress to significant disease. Also, lifestyle changes and other interventions may affect the progress of insignificant disease. Screening efforts in the military aviator population should therefore be aimed at detecting any measurable degree of disease. This review will discuss problems inherent to screening an asymptomatic population, different screening tests, and risk stratified approaches to screening for coronary heart disease. AEROMEDICAL DISPOSITION FOR CORONARY ARTERY DISEASE
P. V. Celio *In* AGARD, Cardiopulmonary Aspects in Aerospace Medicine Oct. 1993 6 p (For primary document see N94-23313 06-52)
Copyright Avail: CASI HC A02/MF A01

Coronary artery disease continues to be a significant concern in aerospace medicine. Coronary disease is a major cause of deaths and sudden incapacitation for males in the flying age population. When coronary disease is found in an aviator, the benefits of his remaining on flying duties must be weighed against his risk of an incapacitating event. The following chapter reviews the probability of a cardiac event in populations of varying degrees of coronary disease including patients following myocardial infarction, angioplasty, and coronary artery bypass surgery. The U.S. Air Force (USAF) experience and recommendation for flying waivers will also be discussed. Author

PRIMARY PREVENTION OF CORONARY HEART DISEASE
William B. Kruyer *In* AGARD, Cardiopulmonary Aspects in Aerospace Medicine Oct. 1993 6 p (For primary document see N94-23313 06-52)
Copyright Avail: CASI HC A02/MF A01

The primary prevention of coronary heart disease is a very prominent and vigorously discussed topic in the medical literature, especially in the area of appropriate lipid profile management. Secondary preventive efforts in patients with known disease seem to be clearly beneficial, but the literature and opinions vary considerably regarding primary preventive efforts and how the existing data should be applied to other patient population subgroups. Studies demonstrating regression of coronary artery atherosclerotic lesions seem to lend support to the validity of primary prevention. This topic is of major interest to the military aerospace medicine practitioner. Classic risk factors which are most applicable to the military aviator include lipid profile, smoking, and regular exercise. These factors will be discussed with pertinent information from the literature with the intent of providing a better understanding of the issues and a reasonable approach to this problem. AEROMEDICAL DISPOSITION OF ARRHYTHMIAS AND ELECTROCARDIOGRAPHIC FINDINGS IN AIRCREW
P. V. Celio *In* AGARD, Cardiopulmonary Aspects in Aerospace Medicine Oct. 1993 9 p (For primary document see N94-23313 06-52)
Copyright Avail: CASI HC A02/MF A01

Screening asymptomatic individuals for occult cardiac disease continues to be a difficult task. One of the standard screening procedures continues to be electrocardiography. Electrocardiography is neither a sensitive nor specific tool in identifying heart disease but continues to offer useful information. Interpretation of these studies for aeromedical purposes requires an appreciation for certain differences between a standard clinical population from which the significance of most ECG findings were obtained and the asymptomatic, generally healthy aviator population. The United States Air Force Central Electrocardiographic Library is the repository for all electrocardiograms obtained on Air Force aviators. This facility was established in 1957 in order to review electrocardiograms performed on Air Force aviators to determine the significance of electrocardiographic findings in asymptomatic individuals and to provide consultative services to local flight surgeons as well as the Surgeon General. The following sections discuss the major classes of electrocardiographic findings, their significance, and additional evaluations required by the USAF. Author (revised)

ECHOCARDIOGRAPHIC SCREENING OF AIRCREW CANDIDATES

Gary Gray *In* AGARD, Cardiopulmonary Aspects in Aerospace Medicine Oct. 1993 2 p (For primary document see N94-23313 06-52)
Copyright Avail: CASI HC A01/MF A01

Military pilot training is expensive for all NATO countries, and screening techniques which detect medical conditions at selection which might later result in grounding or operational restriction of trained pilots are generally cost-effective. Although a careful physical examination and electrocardiogram will detect most disqualifying conditions, there are a number of structural cardiac abnormalities which may be missed by these standard screening measures. These include the following: mitral valve prolapse; bicuspid aortic valve; hypertrophic cardiomyopathy; left ventricular hypertrophy; diastolic dysfunction; regurgitant valves--aortic, mitral, tricuspid, and pulmonic; significant stenosis--aortic, pulmonic, and mitral; and congenital lesions, e.g Ebstein's anomaly. Only four of thirteen NATO aeromedical agencies polled by questionnaire reported that an echo cardiogram is included in the routine initial screening of air crew candidates. The detection of disqualifying or limiting cardiac abnormalities in trained air crew is a clear argument in favor of screening, but it is really the incidence of such abnormalities detected in air crew candidates which determines the cost effectiveness of the procedure. During the AGARD conference 'Medical Selection and Physiologic Training of Future Fighter Aircrew' in Apr. 1985, a paper was presented on echocardiography in Mirage 2000 pilots. In this study, 32 Mirage 2000 pilots and 34 transport pilots underwent echocardiography in order to evaluate the possibility of cardiac changes occurring because of high performance flying. The authors found a statistically significant increase in left atrial size and left ventricular septal thickness. They also felt that there was a very significant difference in right ventricular dimensions. The mean right ventricular size for the transport pilots and the Mirage pilots was 13.265 mm and 16.750 mm, respectively. They felt that 8 of the Mirage 2000 pilots had dilated right ventricles whereas only one of the transport pilots had an enlarged right ventricle. Although the cause of this apparent difference could not be determined by the study, the presence of right ventricular dilatation in high performance pilots raised a significant occupational concern among the NATO countries. Although this may simply be an artifact of the small sample size or a result of the inherent difficulty in obtaining right ventricular dimensions, the possibility that this represented a true occupational hazard was seriously considered. In order to determine the significance of this finding, a larger study was undertaken. The intention of this study is to perform a large cross-sectional study comparing the echocardiographic findings obtained on pilots flying high sustained G aircraft with non high sustained G pilots (tanker, bomber, transport, helicopter pilots, etc.). LEFT VENTRICULAR HYPERTROPHY AND ATHLETE'S HEART

David H. Hull *In* AGARD, Cardiopulmonary Aspects in Aerospace Medicine Oct. 1993 4 p (For primary document see N94-23313 06-52)
Copyright Avail: CASI HC A01/MF A01

Left ventricular hypertrophy (LVH) means literally, overgrowth of the left side of the heart. However the term is generally limited to an abnormal increase in the mass of the left ventricular heart muscle. In pathological terms, this means an increase in the size of the cardiac myocytes as opposed to hyperplasia, an increase in their number. In common parlance, any thickening of the left ventricular wall tends to be described as LVH; this is incorrect where the thickening is due to increase in the size or number of cells other than myocytes, such as fibroblasts, or to abnormal deposits, e.g., amyloid. LVH may be present with normal wall thickness in an enlarged ventricle, for example in volume overload. In health, left ventricular mass is directly related to stature and to body weight, and it increases steadily with age so a single standard (maximum) left ventricular wall thickness for all ages, both sexes, and all bodily configurations must be inappropriate. However, normative standards incorporating these sources of variability are rarely employed. Author (revised)

AORTIC VALVE DISEASE

David H. Hull *In* AGARD, Cardiopulmonary Aspects in Aerospace Medicine Oct. 1993 2 p (For primary document see N94-23313 06-52)
Copyright Avail: CASI HC A01/MF A01

The aortic valve, like the pulmonary valve, forms early in foetal cardiac development soon after the fusion of the 2 bulbar ridges which thus become a septum dividing the primitive bulbus cordis into the aortic and pulmonary trunks. Two cusps of each valve arise from the fused ridges, whilst a third cusp is formed from accessory ridges in each outflow tract. The normal arrangement is of symmetrical semilunar 3-cusped valves in the aorta and the pulmonary trunk, but variations are common. A bicuspid aortic valve is present in 1-2 percent of adults; a unicuspid or quadricuspid valve is much rarer. Bicuspid valves are 4 times commoner in men than in women. Lesser degrees of asymmetry are so common as to be the rule; in one series, only 16 percent of normal aortic valves were perfectly symmetrical in the sense that all 3 cusps were within 5 percent of each others dimensions; in 33 percent of valves, all 3 cusps differed from each other by more than this amount. The significance of these minor degrees of asymmetry, particularly with regard to the later development of aortic valve disease, is unknown. Congenital aortic valve abnormalities are common associations of other types of congenital heart disease, notably of coarctation of the aorta and ventricular septal defect. Aortic valve lesions are asymptomatic in most young people; because of this, and of male preponderance, congenital aortic valve disease is quite common in applicants for flying training; as abnormal physical signs are often trivial or absent, acceptance into air crew training is probably the rule, and the abnormality is recognized only later. Author (revised)

AEROMEDICAL IMPLICATIONS OF MITRAL VALVE PROLAPSE

P. V. Celio *In* AGARD, Cardiopulmonary Aspects in Aerospace Medicine Oct. 1993 3 p (For primary document see N94-23313 06-52)
Copyright Avail: CASI HC A01/MF A01

Mitral valve prolapse (MVP) is the most common cardiac valve disorder in the general adult population. Although the prevalence has been estimated at between 4 percent and 21 percent, the true prevalence is dependent upon the specific population evaluated and the diagnostic criteria applied. For the adult male population of aircrew age, the prevalence is probably between 4 to 7 percent. Although the prognosis of individuals with MVP is generally good, rare complications do occur which include sudden death, infective endocarditis, stroke, transient ischemic attacks, and progressive mitral regurgitation. The following discussion will review the diagnostic criteria as well as the probable risk of each reported complication. Author (revised)

CHRONIC OBSTRUCTIVE PULMONARY DISEASE
David H. Hull *In* AGARD, Cardiopulmonary Aspects in Aerospace Medicine Oct. 1993 4 p (For primary document see N94-23313 06-52)
Copyright Avail: CASI HC A01/MF A01

Chronic Obstructive Pulmonary Disease (COPD) remains a common cause of illness and death in many Western countries and is an increasing problem in developing nations. Although COPD is declining slowly in the UK, it still causes 15,000 deaths annually and is responsible for 10 percent of all working days lost through illness. This is despite improved working conditions, reduced atmospheric pollution, and decreased tobacco consumption. In the USA, COPD is the fifth most common cause of death, causing 57,000 deaths per year. It is estimated that 81.5 percent of this toll is due to cigarette smoking. Clinically apparent disease is largely confined to middle-aged and elderly people, but many young cigarette smokers can be shown to have early evidence of airways disease if adequately investigated. Two main types of COPD are seen, chronic bronchitis and emphysema, though patients may show features of both disorders. Chronic bronchitis is defined as the production of mucoid sputum on most days for at least 3 months during 2 consecutive years. Recurrent respiratory infection is increasingly common as the disease progresses. Stopping smoking may, especially early in the disease, arrest or slow its progression. Otherwise deterioration is relentless. Apart from variable rhonchi, physical signs are often slight till the onset of cor pulmonale, that is failure secondary to the broncho-pulmonary disease. Finger-clubbing, raised venous pressure, fluid retention, evidence of right ventricular hypertrophy, hypercarbia with respiratory acidosis and raised intracranial pressure, and eventually hypoxaemia are the main features; despite remissions cor pulmonale is usually fatal within a few years. SARCOIDOSIS AND THE AVIATOR
David H. Hull *In* AGARD, Cardiopulmonary Aspects in Aerospace Medicine Oct. 1993 3 p (For primary document see N94-23313 06-52)
Copyright Avail: CASI HC A01/MF A01

Sarcoidosis is a chronic granulomatous disease of unknown aetiology. It is of particular importance in clinical aviation practice, for a number of reasons. Although it is a world-wide disease, it appears to be much more prevalent in the populations of developed countries. It is common in young adults; in Europe, more men than women being affected, but possibly the reverse in the USA. The onset may be acute and incapacitating, for example with florid erythema nodosum and acute arthropathy. Other cases are a symptomatic and may be detected only by special tests, e.g., screening chest x-ray, ECG, or blood biochemistry. Though often apparently confined to the thorax, sarcoidosis is typically a multi-system disease with involvement, often silent, of many organs: the skin, eyes, liver, spleen, lymphnodes, bone, central nervous, and cardiovascular systems. Hypercalcaemia is quite a common feature but causes symptoms only when potentially dangerous blood calcium levels are attained. No curative treatment is known, but moderate, severe or progressive disease usually leads to steroid treatment which may have to be prolonged and given in high doses. Cardiac involvement is often inapparent, but can be present with incapacitating arrhythmias, complete heart block with Stokes-Adams attacks, or sudden death. A table summarizes the aspects of main aeromedical concern. Author (revised)

SPONTANEOUS PNEUMOTHORAX, CYSTS AND BULLAE
David H. Hull *In* AGARD, Cardiopulmonary Aspects in Aerospace Medicine Oct. 1993 2 p (For primary document see N94-23313 06-52)
Copyright Avail: CASI HC A01/MF A01

Spontaneous pneumothorax is defined as the presence of air in the pleural cavity without apparent cause. Pulmonary conditions such as tuberculosis or cancer may cause spontaneous pneumothorax, but are excessively rare in aeromedical practice. The usual victims are apparently healthy young men, often in the third decade of life, very often tall and of lean, asthenic build. The chest x-ray may be normal before or after the illness, but may show sub-pleural blebs or small cysts, usually at the lung apex; the rupture of a bleb creates a broncho-pleural communication and the natural elastic lung recoil plus negative pleural pressure draws air into the pleural space. Consequent pulmonary collapse and contraction will narrow and perhaps seal the defect, which usually closes spontaneously in a few days. However the air may take several weeks to reabsorb fully, especially if the pneumothorax is large, so that some form of evacuation of the air, e.g., by underwater seal or flutter valve, is usually desirable for any but the smallest pneumothoraces. The disease is disproportionately important in aeromedical practice, for various reasons. Author (revised)

ASTHMA IN AIRCREW
Gary Gray *In* AGARD, Cardiopulmonary Aspects in Aerospace Medicine Oct. 1993 3 p (For primary document see N94-23313 06-52)
Copyright Avail: CASI HC A01/MF A01

Asthma is a disease characterized by airway inflammation and increased bronchial reactivity. Symptoms, which characteristically are variable, include wheezing, shortness of breath, chest tightness, and cough with sputum. In the past, attention was focused on the airway hyper-reactivity with bronchospasm and wheezing, and treatment was directed towards bronchodilation as first line therapy. In recent years the central role of airway inflammation in the pathogenesis of asthma has gained increasing recognition. Airway inflammation is present in even mild asthmatics, and the treatment of asthma has evolved towards more aggressive management of the underlying inflammatory response as a key element in control. Copyright Avail: CASI HC A02/MF A01

Arterial hypertension is of great importance in the practice of clinical aviation medicine, mainly because of its prominence as a major risk factor for coronary artery disease and other disabling cardiovascular diseases and because it is so common. Timely recognition of early or mild hypertension should facilitate appropriate intervention which will prevent complications and enable the air crewman to continue his career, hopefully, to normal retirement age. The consequent health benefits and fiscal advantages, both to the individual and to the air forces and airlines of the world, are obvious and substantial Author (revised)

CYTOKINES AND IMMUNE SURVEILLANCE IN HUMANS Final Report
Gerald Sonnenfeld 7 Jan. 1994 5 p
(Grant NAG9-485)
(NASA-CR-194801; NAS 1.26:194801) Avail: CASI HC A01/MF A01

Evidence from both human and rodent studies has indicated that alterations in immunological parameters occur after space flight. Among the parameters shown, by us and others, to be affected is the production of interferons. Interferons are a family of cytokines that are antiviral and play a major role in regulating immune responses that control resistance to infection. Alterations in interferon and other cytokine production and activity could result in changes in immunity and a possible compromise of host defenses against both opportunistic and external infections. The purpose of the present study is to explore further the effects of space flight on cytokines and cytokine-directed immunological function. Among the tests carried out are interferon-alpha production, interferon-gamma production, interleukin-1 and -2 production, signal transduction in neutrophils, signal transduction in monocytes, and monocyte phagocytic activity. The experiments will be performed using peripheral blood obtained from human subjects. It is our intent to eventually carry out these experiments using astronauts as subjects to determine the effects of space flight on cytokine production and activity. However, these subjects are not currently available. Until they become available, we will carry out these experiments using subjects maintained in the bed-rest model for microgravity. RESPONSES TO LBNP IN MEN WITH VARYING PROFILES OF STRENGTH AND AEROBIC CAPACITY: IMPLICATIONS FOR FLIGHT CREWS Technical Paper, Jul. 1985 - Apr. 1986

Victor A. Convertino, Karen L. Mathes (Krug International, Houston, TX.), Mary L. Lasley (Bionetics Corp., Cocoa Beach, FL.), Clare Marie Tomaselli (John B. Pierce Foundation of Connecticut, New Haven.), Mary Anne Bassett Frey (Lockheed Engineering and Sciences Co., Washington, DC.), and G. Wyckliffe Hoffler Mar. 1993 36 p

(NASA-TP-3346; NAS 1.60:3346) Avail: CASI HC A03/MF A01

Hemodynamic and hormonal responses to lower-body negative pressure (LBNP) were examined in 24 healthy men to test the hypothesis that responsiveness of reflex control of blood pressure during orthostatic stress is associated with strength and/or aerobic capacity. Subjects underwent treadmill tests to determine peak oxygen uptake (peak VO2) and isokinetic dynamo meter tests to determine leg strength. Based on predetermined criteria, the subjects were classified into one of four fitness profiles of six subjects each matched for age, height, and weight: (1) low strength/low aerobic fitness; (2) low strength/high aerobic fitness; (3) high strength/low aerobic fitness; and (4) high strength/high aerobic fitness. Following 90 min of 6 degree head-down tilt (HDT), each subject underwent graded LBNP through -50 mmHg or presyncope, with maximal duration 15 min. All groups exhibited typical hemodynamic, hormonal, and fluid shift responses during LBNP, with no intergroup differences except for catecholamines. Seven subjects, distributed among the four fitness profiles, became presyncopal. Subjects who showed greatest reduction in mean arterial pressure (MAP) during LBNP had greater elevations in vasopressin and lesser increases in heart rate and peripheral resistance. Peak VO2 nor leg strength were correlated with fall in MAP or with syncopal episodes. We conclude that neither aerobic nor strength fitness characteristics are good predictors of responses to LBNP stress. Author

FLUID-LOADING SOLUTIONS AND PLASMA VOLUME: ASTRO-ADE AND SALT TABLETS WITH WATER

Suzanne M. Fortney, Laura Seinmann (Krug Life Sciences, Inc., Houston, TX.), Joan A. Young (Krug Life Sciences, Inc., Houston, TX.), Cherylynn N. Hoskin (Krug Life Sciences, Inc., Houston, TX.), and Linda H. Barrows (Krug Life Sciences, Inc., Houston, TX.) Jan. 1994 24 p

(NASA-TP-3456; S-756; NAS 1.60:3456) Avail: CASI HC A03/MF A01

Fluid loading with salt and water is a countermeasure used after space flight to restore body fluids. However, gastrointestinal side effects have been frequently reported in persons taking similar quantities of salt and water in ground-based studies. The effectiveness of the Shuttle fluid-loading countermeasure (8 gms salt, 0.97 liters of water) was compared to Astro-ade (an isotonic electrolyte solution), to maintain plasma volume (PV) during 4.5 hrs of resting fluid restriction. Three groups of healthy men (n=6) were studied: a Control Group (no drinking), an Astro-ade Group, and a Salt Tablet Group. Changes in PV after drinking were calculated from hematocrit and hemoglobin values. Both the Salt Tablet and Astro-ade Groups maintained PV at 2-3 hours after ingestion compared to the Control Group, which had a 6 percent decline. Side effects (thirst, stomach cramping, and diarrhea) were noted in at least one subject in both the Astro-ade and Salt Tablet Groups. Nausea and vomiting were reported in one subject in the Salt Tablet Group. It was concluded that Astro-ade may be offered as an alternate fluid-loading countermeasure but further work is needed to develop a solution that is more palatable and has fewer side effects. This compendium includes abstracts and synopses of clinical observations and of more basic studies involving physiological mechanisms concerning interaction of physical exercise and the human immune system. If the author's abstract or summary was appropriate, it was included. In other cases, a more detailed synopsis of the paper was prepared under the subheadings 'Purpose,' 'Methods,' 'Results,' and 'Conclusions.' Author and subject indices are provided, plus a selected bibliography of related work or those papers received after the volume was being prepared for publication. This volume includes material published from 1902 through 1991. Author (revised)

VISION IMPAIRMENT AND CORRECTIVE CONSIDERATIONS OF CIVIL AIRMEN

Van B. Nakagawara, Kathryn J. Wood, and Ronald W. Montgomery Dec. 1993 8 p

(DOT/FAA/AM-93/21) Avail: CASI HC A02/MF A01

Civil aviation is a major commercial and technological industry in the United States. The Federal Aviation Administration (FAA) is responsible for the regulation and promotion of aviation safety in the National Airspace System. The Office of Aviation Medicine oversees investigations on visual disorders and vision corrective devices of airmen and air traffic controllers. A review of the demographics of the civil airman population was performed using FAA publications and databases. Approximately 48 percent of the civil airman population is greater than or equal to 40 years of age (average age = 39.8 years). Many of these aviators are becoming presbyopic and will need corrective devices for near and intermediate vision. In fact, there has been an approximate 12 percent increase in the number of aviators with near vision restrictions in the last decade. Ophthalmic considerations for eye care practitioners prescribing and dispensing for civil aviators are discussed. This data is useful for the Office of Aviation Medicine to guide policy changes and educational programs for airmen with vision impairment and who use corrective ophthalmic lenses in the aviation environment, particularly the increasing number of presbyopic airmen. AUTOGENIC-FEEDBACK TRAINING: A POTENTIAL TREATMENT FOR POST-FLIGHT ORTHOSTATIC INTOLERANCE IN AEROSPACE CREWS

Patricia S. Cowings, William B. Toscano (California Univ., Los Angeles.), Neil E. Miller (Yale Univ., New Haven, CT.), Thomas G. Pickering (Cornell Univ., New York, NY.), and David Shapiro (California Univ., Los Angeles.) Sep. 1993 15 p

(RTOP 199-14-12-06)

(NASA-TM-108785; A-93109; NAS 1.15:108785) Avail: CASI HC A03/MF A01

Postflight orthostatic intolerance was identified as a serious biomedical problem associated with long duration exposure to microgravity in space. High priority was given to the development of countermeasures for this disorder which are both effective and practical. A considerable body of clinical research demonstrated that people can be taught to increase their own blood pressure voluntarily and that this is an effective treatment for chronic orthostatic intolerance in paralyzed patients. The present pilot study was designed to examine the feasibility of adding training in control of blood pressure to an existing preflight training program designed to facilitate astronaut adaptation to microgravity. Using an operant conditioning procedure, Autogenic-Feedback Training (AFT), three men and two women participated in four to nine (15-30 training sessions). At the end of training, the average increase in systolic and diastolic pressure, as well as mean arterial pressures that the subjects made, ranged between 20 and 50 mmHg under both supine and 45 deg head-up tilt conditions. These findings suggest that AFT may be a useful alternative treatment or supplement to existing approaches for preventing postflight orthostatic intolerance. Further, the use of operant conditioning methods for training cardiovascular responses may contribute to the general understanding of the mechanisms of orthostatic intolerance. Author (revised)

TRANSFER OF PERCEPTUAL ADAPTATION TO SPACE SICKNESS: WHAT ENHANCES AN INDIVIDUAL'S ABILITY TO ADAPT? Final Report
9 Aug. 1993 15 p
(Contract NAS9-18035)
(NASA-CR-188256; NAS 1.26:188256) Avail: CASI HC A03/MF A01

The objectives of this project were to explore systematically the determiners of transfer of perceptual adaptation as these principles might apply to the space adaptation syndrome. The perceptual experience of an astronaut exposed to the altered gravitational forces involved in spaceflight shares much with that of the subject exposed in laboratory experiments to optically induced visual rearrangement with tilt and dynamic motion illusions such as vection; and experiences and symptoms reported by the trainee who is exposed to the compellingly realistic visual imagery of flight simulators and virtual reality systems. In both of these cases the observer is confronted with a variety of inter- and intrasensory conflicts that initially disrupt perception, as well as behavior, and also produce symptoms of motion sickness. AUDITORY SPECTRO-TEMPORAL PATTERN ANALYSIS Annual Report, 1 Jan. - 31 Dec. 1993
Joseph W. Hall 31 Dec. 1993 4 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F40620-93-1-0045)
(AD-A273554; AFOSR-93-0856TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The present research is a continuation of an AFOSR-sponsored program that has supported our research on CMR essentially since the discovery of the phenomenon. Over the past six years, the research program has revealed several important findings related to CMR: the phenomenon is based primarily upon an across-frequency analysis of amplitude envelope; all portions of the envelope do not appear to contribute equally to CMR - envelope dips carry the critical information; CMR increases with the number of comodulated noise bands present, with diminishing returns after three bands are present; the presence of non-comodulated bands within a set of comodulated bands can substantially decrease CMR; when auditory grouping principles are applied to segregate the noncomodulated bands from the comodulated bands, CMR can be restored to a significant extent; CMR occurs for FM, but a much smaller magnitude than for AM; and part of the MLD appears to be based upon a process that is essentially identical to CMR. A STATISTICAL ANALYSIS OF RECENT NAVAL EXPERIMENTAL DIVING UNIT (NEDU) SINGLE-DEPTH HUMAN EXPOSURES TO 100 PERCENT OXYGEN AT PRESSURE Technical Report, 1987 - 1991
A. L. Harabin and S. S. Survanshi Oct. 1993 28 p
(NMRI Proj. M00-99)
(AD-A273488; NMRI-93-59) Avail: CASI HC A03/MF A01

Using the data from 688 human, single-depth, hyperbaric oxygen (O2) exposures conducted at the Naval Experimental Diving Unit and reported on from 1979-1986, we developed a mathematical model that can predict the risk of developing symptoms of central nervous system O2 toxicity as a function of time and depth of exposure. Maximum likelihood analysis with models relating depth and time of exposure to risk accumulation was used to estimate probability of symptom development and confidence intervals. U.S. Navy single depth-time O2 diving limits were evaluated for safety as a function of actual PO2 achieved in the breathing apparatus. These results suggest that current limits are not of equal risk. Long shallow exposures might present unacceptably high risk if an F1O2 = 1.0 were achieved in the breathing rig. Adherence to current recommended purging procedures results in acceptably low (less than 1%) risk predictions for all depths. DTIC

PREDICTIVE HEAD MOVEMENT TRACKING USING INNOVATIONS GENERATED BY KALMAN FILTERS M.S. Thesis

Andrew Muwanga Kiruluta 1993 124 p
(ISBN-0-315-83371-8; CTN-94-60957) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

The use of head movements for control leaves hands free for other tasks and utilizes the mobility of the head to acquire and track targets over a wide field of view. Kalman filtering was applied to generate prediction estimates for tracking head positions. For relatively slow smooth head movements, a constant velocity model (CVM) sufficiently represents head dynamics. However, when the head undergoes significant maneuvers, a constant acceleration model (CAM) is preferred. To take advantage of the prediction performance of the CVM under relatively slow smooth dynamics and those of the CAM under fast dynamics, a simple adaptive algorithm is proposed. Using the adaptive model yields a compromise performance for both relatively slow and fast smooth head movements. For abrupt head movements, all the above models were inadequate. An input estimation algorithm was implemented but its prediction performance degrades significantly for head accelerations in excess of 5,000 deg/sec. To provide for a baseline comparison for tracking performance, a simple parabolic polynomial fit generated prediction estimates. The resulting fit yielded prediction root mean square errors of over 2 and 23 deg for smooth and abrupt head movements respectively. Hence, the Kalman filter does indeed yield better estimates of head positions than a simple polynomial predictor.

EEG AND CHAOS: DESCRIPTION OF UNDERLYING DYNAMICS AND ITS RELATION TO DISSOCIATIVE STATES Final Progress Report

William J. Ray 23 Feb. 1994 10 p
(Grant NAG1-1441)
(NASA-CR-195171; NAS 1.26:195171) Avail: CASI HC A02/MF A01

The goal of this work is the identification of states especially as related to the process of error production and lapses of awareness as might be experienced during aviation. Given the need for further articulation of the characteristics of 'error prone state' or 'hazardous state of awareness,' this NASA grant focused on basic ground work for the study of the psychophysiology of these states. In specific, the purpose of this grant was to establish the necessary methodology for addressing three broad questions. The first is how the error prone state should be conceptualized, and whether it is similar to a dissociative state, a hypnotic state, or absent mindedness. Over 1200 subjects completed a variety of psychometric measures reflecting internal states and proneness to mental lapses and absent mindedness; the study suggests that there exists a consistency of patterns displayed by individuals who self-report dissociative experiences such that those individuals who score high on measures of dissociation also score high on measures of absent mindedness, errors, and absorption, but not on scales of hypnotizability. The second broad question is whether some individuals are more prone to enter these states than others. A study of 14 young adults who scored either high or low on the dissociation experiences scale performed a series of six tasks. This study suggests that high and low dissociative individuals arrive at the experiment in similar electrocortical states and perform cognitive tasks (e.g., mental math) in a similar manner; it is in the processing of internal emotional states that differences begin to emerge. The third question to be answered is whether recent research in nonlinear dynamics, i.e., chaos, offer an addition and/or alternative to traditional signal processing methods, i.e., fast Fourier transforms, and whether chaos procedures can be modified to offer additional information useful in identifying brain states. A preliminary review suggests that current nonlinear dynamical techniques such as dimensional analysis can be successfully applied to electrocortical activity. Using the data set developed in the study of the young adults, chaos analyses using the Farmer algorithm were performed; it is concluded that dimensionality measures reflect information not contained in traditional EEG Fourier analysis.

A WHITE PAPER: NASA VIRTUAL ENVIRONMENT RESEARCH, APPLICATIONS, AND TECHNOLOGY

Cynthia H. Null, ed. (National Aeronautics and Space Administration. Ames Research Center, Moffett Field, CA.) and James P. Jenkins, ed. 1 Oct. 1993 127 p
(NASA-TM-109682; NAS 1.15:109682) Avail: CASI HC A07/MF A02

Research support for Virtual Environment technology development has been a part of NASA's human factors research program since 1985. Under the auspices of the Office of Aeronautics and Space Technology (OAST), initial funding was provided to the Aerospace Human Factors Research Division, Ames Research Center, which resulted in the origination of this technology. Since 1985, other Centers have begun using and developing this technology. At each research and space flight center, NASA missions have been major drivers of the technology. This White Paper was the joint effort of all the Centers which have been involved in the development of technology and its applications to their unique missions. Appendix A is the list of those who have worked to prepare the document, directed by Dr. Cynthia H. Null, Ames Research Center, and Dr. James P. Jenkins, NASA Headquarters. This White Paper describes the technology and its applications in NASA Centers (Chapters 1, 2 and 3), the potential roles it can take in NASA (Chapters 4 and 5), and a roadmap of the next 5 years (FY 1994-1998). The audience for this White Paper consists of managers, engineers, scientists and the general public with an interest in Virtual Environment technology. Those who read the paper will determine whether this roadmap, or others, are to be followed.

LUMINANCE-BRIGHTNESS MAPPING: THE MISSING DECADES Ph.D. Thesis

Gerard Schouten 1993 129 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-94-95351) Avail: CASI HC A07

A study directed at the understanding of brightness perception in relation to the information reduction involved is reported. Concentration is on brightness representations of images that can be considered as single, nonrelated entities. Particularly, it is investigated whether differences between the luminance map and the brightness map may be interpreted as appearances of compression mechanisms. First of all psychophysical experiments were conducted. Some general comments concerned with the experiments can be made. Stimuli consisting of a Ganzfeld, a homogeneous field of view, on which a number of disks were superimposed, were used. The whole visual field was thus stimulated in a controllable manner. The method employed was brightness matching. More specifically, to investigate the luminance-brightness compression, the large luminance range was traversed in two different ways. In a first experiment exploring brightness constancy, scene luminances were varied with certain multipliers. In the second series of experiments, luminance ratios within a scene were altered. Subsequently, the compression mechanisms revealed by the experimental results are integrated into a novel brightness algorithm which is presented. This algorithm is applied to a set of brightness illusions including brightness induction and brightness assimilation phenomena, Mach bands, and Craik-O'Brien-Cornsweet effects.

MECHANISMS OF EYE-HAND COORDINATION Final Report, 1 Jul. 1992 - 30 Jun. 1993

Apostolos P. Georgopoulos 29 Nov. 1993 8 p
(Contract N00014-92-J-1905)
(AD-A273687) Avail: CASI HC A02/MF A01

We studied the capacities of human subjects to localize tactile stimuli in three dimensional space. For that purpose, five subjects (three women and two men) were asked to make a pointing movement to a visual stimulus in otherwise complete darkness. At some random time before, during or after this initial movement, a tactile probe was presented to the tip of the subject's index finger. The probe (1-mm diameter, 0.75-mm extent, 5-ms duration) was applied by a lightweight (80 g) tactile stimulator worn on the subject's hand. To complete the task, the subject was required to point to the three dimensional spatial location at which the probe was applied. Hand position was monitored (200 Hz) by a video-based motion analysis system. In each subject, probes presented just before or during the initial movement were systematically mislocalized in the direction of that movement so that subjects perceived the probe to be at the location occupied by the hand 50 to 100 ms after probe onset. This mislocalization is likely to be important in dealing with objects in the dark, especially with obstacles encountered along a movement's path.

PERCEPTIONS OF ORGANIZATIONAL SUPPORT AND AFFECTIVITY AS PREDICTORS OF JOB SATISFACTION Final Report
L. Alan Witt Feb. 1994 13 p
(DOT/FAA/AM-94/2) Avail: CASI HC A03/MF A01

Staw, Bell, and Clausen have suggested that employees 'bring a positive or negative disposition to the work setting, process information about the job in a way that is consistent with that disposition, and then experience job satisfaction or dissatisfaction as a result.' Although this is not a universally held viewpoint, given such endeavors as the FAA Job Satisfaction Survey and managerial efforts to improve overall job satisfaction, the issue of employee disposition is important. Agency attempts to alter the work situation for the purposes of increasing job satisfaction could have limited potential for success to the extent that job satisfaction is a function of disposition. Several hypotheses examining both the main and interactive effects on job satisfaction of variables assessing the person (disposition) and situation (organizational climate) across several organizations were tested. Disposition refers to employee descriptions of how they generally feel in response to the PANAS Affectivity scale developed by Watson and Clark. The PANAS is comprised of 20 adjectives that describe both positive (PA) and negative (NA) affect. Data were accumulated by meta-analysis from 1,491 employees in 35 different organizational systems. This included survey data from employees at the FAA Aeronautical Center (N=1,029) in Oklahoma City, Air Traffic Control Specialist trainees from the FAA Academy Nonradar Screen Program (N=397) in Oklahoma City, and teachers from a rural public school system (N=65) in Illinois. Employees in each of those groups were participants in larger surveys of job satisfaction and other attitudinal factors that influence job satisfaction. Results indicated that perceptions of organizational support were more strongly related to job satisfaction than was disposition (positive affectivity (PA) or negative affectivity (NA)). NA had a larger moderating effect than PA on the perceived support-job satisfaction relationship. These results suggest that NA may have influenced the extent to which perceptions of organizational support impact employee job satisfaction. Considered together with longitudinal studies in this area, these findings suggest that dispositional differences in affectivity should be considered in interventions designed to have an impact on the attitudes of agency employees. Organizational development specialists and managers should give some consideration to how individual differences in affectivity can influence responses to the existing organizational climate and culture as attempts are made to promote organizational change and improve overall job satisfaction.

EYE-GAZE CONTROL OF THE COMPUTER INTERFACE: DISCRIMINATION OF ZOOM INTENT
J. H. Goldberg (Pennsylvania State Univ., University Park.) and J. C. Schryver 1993 6 p Presented at the Human Factors and Ergonomics Society Meeting, Seattle, WA, 11-15 Oct. 1993
(Contracts DE-AC05-84OR-21400; DE-AC05-76OR-00033)
(DE94-000480; CONF-9310100-3) Avail: CASI HC A02/MF A01

An analysis methodology and associated experiment were developed to assess whether definable and repeatable signatures of eye-gaze characteristics are evident, preceding a decision to zoom-in, zoom-out, or not to zoom at a computer interface. This user intent discrimination procedure can have broad application in disability aids and telerobotic control. Eye-gaze was collected from ten subjects in a controlled experiment, requiring zoom decisions. The eye-gaze data were clustered, then fed into a multiple discriminant analysis (MDA) for optimal definition of heuristics separating the zoom-in, zoom-out, and no-zoom conditions. Confusion matrix analyses showed that a number of variable combinations classified at a statistically significant level, but practical significance was more difficult to establish.

Composite contour plots demonstrated the regions in parameter space consistently assigned by the MDA to unique zoom conditions. Peak classification occurred at about 1200-1600 msec. Improvements in the methodology to achieve practical real-time zoom control are considered.

MANNED MARS MISSION ON-ORBIT OPERATIONS FTS CAPABILITIES ASSESSMENT Final Report
Frank G. Gallo and Stewart W. Jackson 30 Jun. 1989 54 p
(Contract NAS5-30189)
(NASA-CR-189328; NAS 1.26:189318) Avail: CASI HC A04/MF A01

This document presents an overview of the characteristics and capabilities of the flight telerobotic servicer (FTS), under development at GSFC at the time the report was prepared; the project has since been cancelled. The assessment was directed toward developing the FTS to enable assembly and servicing of the Mars vehicle at the space station; facilitate rendezvous, docking, and fluid transfer operations involving the Mars vehicle fuel tank; to perform strip-mining operations on the lunar/martian surfaces; and to construct a three-story shelter on the martian surface. The report considers the FTS' mechanical, electrical, thermal, and operational subsystems, as well as its proposed manipulator capabilities. Author (revised)

PILOT-VEHICLE INTERFACE Final Report
L. Harrison, J. Janowitz, and M. Castronuovo Nov. 1993 182 p
(Contract DTFA03-89-C-00043)
(DOT/FAA/CT-92/21) Avail: CASI HC A09/MF A02

The cockpits of the early transport aircraft were quite different from those produced today. Older cockpits contained numerous 'steam gauge' style indicators. As technology advanced, these older electromechanical indicators were gradually replaced by newer, more reliable digital systems. Digital flight control and avionic systems are being used increasingly in modern aircraft. This trend yields cockpits of greater complexity and has swelled the amount of information with which the crew must deal. The way the pilot controls and monitors the state of the aircraft has also been greatly influenced by the increased use of digital systems. Additionally, new methods of aircraft system monitoring and control are being researched and implemented. These systems use new display technology, programmable display formats, voice input and output, and other new input and control devices. Systems and their cockpit interfaces were added as technological advances were made and new requirements generated. The human interface was given little consideration in the layout of the cockpit. Human qualities and failure modes were not taken into account in the cockpit design process. As the number of systems, components, indicators, and switches multiplied, the potential for error also grew. The emphasis of this report is on civil transport aircraft. This includes technologies such as displays, controls, and design methodologies, along with human factors concerns. The report consists of four sections: civil transport cockpit, cockpit standards, cockpit technology, and cockpit human factors. This report is to serve as a guide to Certification Engineers who are faced with the task of certification of new cockpit technologies. Author

Integrated Vehicle Health Management (IVHM) consists of instrumenting measurable parameters to collect information on an existing system that then aids decision making which leads to reduced life-cycle costs. The information must be extracted from data measured and reduced to a point where people can make good, logical decisions. IVHM requires sensors coupled to data reduction systems that allow patterns to be detected, operating environments characterized, and system performance verified in order to optimize the overall system to reduce costs. A key component in building an IVHM system is the communications capability between the actual parameter being measured and the final user of the information extracted. This information flow must be sufficiently flexible to allow the sensors and parameters measured to change as the needs and requirements of the overall system changes. The first step in creating an IVHM is to make the sensor interface more intelligent and thereby more flexible. This is a Final Report for the NASA Research Announcement (NRA) Strategic Avionics Technology Definition Studies Martin Marietta Task entitled 'Health Management and Process Demonstration for Aerospace Systems'. This report covers Task 1: Health Management Demonstration and is submitted to Johnson Space Center (JSC) in fulfillment of the reports of work specified in the contract (NAS9-18879). Task 2: Process Management Environment and Support of Enterprise Integration, and Task 3: New Algorithm Development in the PME, are also presented. Derived from text

ACTIVITY CATALOG TOOL (ACT) USER MANUAL, VERSION 2.0
Leon D. Segal and Anthony D. Andre Jan. 1994 25 p
(Contract NCC2-486)
(NASA-CR-177634; A-94046; NAS 1.26:177634) Avail: CASI HC A03/MF A01

This report comprises the user manual for version 2.0 of the Activity Catalog Tool (ACT) software program, developed by Leon D. Segal and Anthony D. Andre in cooperation with NASA Ames Aerospace Human Factors Research Division, FLR branch. ACT is a software tool for recording and analyzing sequences of activity over time that runs on the Macintosh platform. It was designed as an aid for professionals who are interested in observing and understanding human behavior in field settings, or from video or audio recordings of the same. Specifically, the program is aimed at two primary areas of interest: human-machine interactions and interactions between humans. The program provides a means by which an observer can record an observed sequence of events, logging such parameters as frequency and duration of particular events. The program goes further by providing the user with a quantified description of the observed sequence, through application of a basic set of statistical routines, and enables merging and appending of several files and more extensive analysis of the resultant data. SURVIVAL SUIT FOR SUBMARINE PERSONNEL: SUMMARY OF EVALUATION STUDIES [RAEDDNINGSDRAEKT FOER UBATSPERSONAL: SLUTRAPPORT]
Mikael Gennser, Ake Larsson, and Hans Oernhagen Mar. 1993 33 p
In SWEDISH See also PB90-201021 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-204634; FOA-A-50014-5.1) Avail: CASI HC A03

Survival suits for submarine personnel should be able to protect against drowning and hypothermia for long periods of severe weather conditions. The Division of Naval Medicine of the Swedish Defense Research Establishment has carried out a series of tests of survival suits with and without a one-man life-raft in cold water during simulated winter conditions. Tests were also carried out with a modified suit to evaluate suggested modifications. The tests were completed with a study of the buoyancy and floating position of the suits in heavy sea. An investigation of different materials for diapers to improve the urine collection system and an experimental study regarding the possibility of reducing the urine output during stays in cold water using a synthetic antidiuretic hormone were also carried out. In the report the main results of the tests are summarized, the problems with the various suits are discussed, and improvements are suggested. In conclusion three suit concepts that are thought to be able to fulfill the requirements are described and ranked: (1) a double-layered suit with life-raft, (2) a single-layered suit with extra buoyancy and life-raft, and (3) a modified double-layered suit with extra buoyancy. HARMONISATION OF MAN-MACHINE INTERFACE EXPERIMENTS IN THE CONTEXT OF THE DEVELOPMENT OF PHARE ADVANCED TOOLS Report, Jan. - Aug. 1992
S. Broadbent 1993 130 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-204725; EEC-256) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

The objective of the document is to provide PHARE researchers concerned with Human-Machine Interfaces (HMI) evaluation studies with a series of indications as to the experimental methods that can be employed to evaluate interface prototypes. The document does not require the reader to have specific expertise in human factors experimental methods, but attempts to provide the background for some fundamental principles of experimental design. The proposed evaluation methodology consists of a controlled experimental methodology which will involve part-task investigations, i.e., a small sub-component of the control activity will be examined in each study. The experimenter isolates the function or functions of the interface that require close scrutiny and design specific experimental environments to assess users' interactions with that particular feature of the interface. Ten steps of experimentation are detailed in the document including the selection of assessment measures, the selection of experimental subjects, and decisions about design and results analysis. For each step a number of indications is be provided on the rationale behind one or another design option. NTIS

REDUCING VIDEO FRAME RATE INCREASES REMOTE OPTIMAL FOCUS TIME

Richard F. Haines (RECOM Technologies, Inc., Moffett Field, CA.) Jun. 1993 8 p
(RTOP 476-14-03)
(NASA-TM-104018; A-93075; NAS 1.15:104018) Avail: CASI HC A02/MF A01

Twelve observers made best optical focus adjustments to a microscope whose high-resolution pattern was video monitored and displayed first on a National Television System Committee (NTSC) analog color monitor and second on a digitally compressed computer monitor screen at frame rates ranging (in six steps) from 1.5 to 30 frames per second (fps). This was done to determine whether reducing the frame rate affects the image focus. Reducing frame rate has been shown to be an effective and acceptable means of reducing transmission bandwidth of dynamic video imagery sent from Space Station Freedom (SSF) to ground scientists. Three responses were recorded per trial: time to complete the focus adjustment, number of changes of focus direction, and subjective rating of final image quality. It was found that: the average time to complete the focus setting increases from 4.5 sec at 30 fps to 7.9 sec at 1.5 fps (statistical probability = 1.2 x 10(exp -7)); there is no significant difference in the number of changes in the direction of focus adjustment across these frame rates; and there is no significant change in subjectively determined final image quality across these frame rates. These data can be used to help pre-plan future remote optical-focus operations on SSF. Author (revised)

EVALUATION OF VISUAL ACUITY WITH GEN 3 NIGHT VISION GOGGLES

Arthur Bradley (Indiana Univ., Indianapolis.) and Mary K. Kaiser Jan. 1994 40 p
(NASA-TM-108792; A-93134; NAS 1.15:108792) Avail: CASI HC A03/MF A01

Using laboratory simulations, visual performance was measured at luminance and night vision imaging system (NVIS) radiance levels typically encountered in the natural nocturnal environment. Comparisons were made between visual performance with unaided vision and that observed with subjects using image intensification. An Amplified Night Vision Imaging System (ANVIS6) binocular image intensifier was used. Light levels available in the experiments (using video display technology and filters) were matched to those of reflecting objects illuminated by representative night-sky conditions (e.g., full moon, starlight). Results show that as expected, the precipitous decline in foveal acuity experienced with decreasing mesopic luminance levels is effectively shifted to much lower light levels by use of an image intensification system. The benefits of intensification are most pronounced foveally, but still observable at 20 deg eccentricity. Binocularity provides a small improvement in visual acuity under both intensified and unintensified conditions. Author (revised)

VISUAL PROBLEMS IN NIGHT OPERATIONS [PROBLEMES DE VISION DANS LES OPERATIONS DE NUIT]

May 1992 96 p In ENGLISH and FRENCH Lecture series held in Madrid, Spain, 1-2 Jun. 1992, in Soesterberg, Netherlands, 4-5 Jun. 1992, and in Brooks AFB, TX, 15-16 Jun. 1992
(AGARD-LS-187; ISBN-92-835-0676-6) Copyright Avail: CASI HC A05/MF A01

The aim of this Lecture Series is to provide the aeromedical specialist with a thorough understanding of the physiology of the visual system with particular concentration on the impact of the environment presented during night tactical air operations. Methods to preserve, protect, or enhance unaided night vision will be discussed. Information concerning visual performances with electro-optic devices derived from aeromedical research and field experiences will be detailed to provide the medical specialists, the engineers, and operational pilots with appropriate understanding of these increasingly common operational tools. This Lecture Series, sponsored by the Aerospace Medical Panel of AGARD, was implemented by the Consultant and Exchange Programme of AGARD. For individual titles, see N94-23977 through N94-23984.

NIGHT OPERATIONS

William E. Berkley *In* AGARD, Visual Problems in Night Operations May 1992 4 p (For primary document see N94-23976 06-54)
Copyright Avail: CASI HC A01/MF A01

Strategists have long sought to exploit the night in military operations, not only to avoid detection and as a means to defeat visually or optically aimed weapons, but also to deny the enemy an opportunity to rest or resupply his troops. With the advent of practical and effective imaging devices, true night war fighting capability has at last become a reality (as demonstrated in the recent Gulf War). It is safe to assume that night military operations will receive even more emphasis in the future. Current aviation activities range from basic single pilot helicopter operations with night vision goggles (NVG's) to complex missions utilizing a mix of highly sophisticated aircraft with multiple sensors, precise navigational capabilities, and advanced weapons delivery systems. PHYSICAL ASPECTS OF THE VISUAL STIMULUS [ASPECTS PHYSIQUES DU STIMULUS VISUEL]

Jean-Pierre Menu *In* AGARD, Visual Problems in Night Operations May 1992 8 p In FRENCH (For primary document see N94-23976 06-54)
Copyright Avail: CASI HC A02/MF A01

The various physical and psychophysical aspects of the visual stimulus are considered. It is a question of defining as precisely as possible the physical stimulation of input to the visual systems (nature of radiation, light intensities, colors, and organization in space and time). It is often difficult to dissociate the physical aspect from the psychophysical aspect. This last aspect translates the impact of the physical aspect on the socket and the treatment of information through the visual channel. It is consequently important to define as precisely as possible the operation of the retinal sensor. Mechanisms of the integration of information are described. The physical structure of the images of several systems of substitution to night vision are analyzed. Transl. by FLS

PERCEPTION IN FLIGHT: SHAPE AND MOTION PERCEPTION, SPACE PERCEPTION, SPATIAL ORIENTATION, AND VISUAL VESTIBULAR INTERACTION c53

Herschel W. Leibowitz *In* AGARD, Visual Problems in Night Operations May 1992 9 p (For primary document see N94-23976 06-54)
Copyright Avail: CASI HC A02/MF A01

Differences between the normal terrestrial and the flight environment are described which may lead to perceptual errors in flight. Specific examples involving the perception of shape and height are discussed as they may relate to nighttime landing accidents. The possible role of misperceived

risk is suggested as a contributing factor. The mechanisms subserving motion perception and gaze stability are outlined briefly as the basis for understanding false sensations, illusory motion, spatial disorientation, and motion sickness. It is suggested that an appropriate countermeasure to perceptual errors in the nighttime flight environment is to inform flight crews of the mechanisms and mode of operation of the perceptual systems involved as the basis for understanding how they might misfunction.

The concept of mental images is paradoxically poorly linked to visual perception. It is related to the domain of mental representation, and thus is explained with reference to the field of cognitive psychology. This domain being relatively new for most of the listeners of this short course, basic concepts are didactically introduced. A framework model of cognitive activities is set up, introducing first the various memories, then focusing on mental representation processes. The specificites of mental representation are detailed (laconism, distorsion, parcimony, and task-oriented). Special emphasis is given to the mental representation theory of double coding: verbal and image coding and its relationship with activity. A last section describes how mental representation, especially mental image, could serve or impair night-flight activities. Author (revised)

MULTI-SENSORAL APPROACH TO NIGHT FLIGHT: PERCEPTIVE AND COGNITIVE LIMITATIONS [APPROCHE MULTI-SENSEURS POUR LE VOL DE NUIT: LIMITATIONS PERCEPTIVES ET COGNITIVES]
Rene Amalberti *In* AGARD, Visual Problems in Night Operations May 1992 9 p In FRENCH (For primary document see N94-23976 06-54)
Copyright Avail: CASI HC A02/MF A01

Night-flight activities have significantly grown to allow Forces being permanently operational. The level of performance for these activities is expected to be the same as it is in day time. Thus, visual support systems have been designed to mitigate the consequences of night-vision limitations, e.g. Electro-optical systems (radar), NVG, FLIR, and Real-time terrain image. Some of these support-systems are mixed, using several sources although they provide the pilot with only one resulting integrated image. Moreover, when the pilot continues to have a direct vision of the external world (vision through the optical system), the human vision has to be considered as another point of view to be integrated with this type of visual support system. This is typically what is termed the integrated multi-sensor and sensory approach. Humans have a special position in such conditions: first, from a perceptive point of view, although they are impaired by night-conditions, their eyes complement machine vision. Second, from a reasoning and decision making point of view, they must adapt their mental processes to this complex visual input made of a mixture of natural and artificial vision. The resulting effects of this position for perception and reasoning activities are described. The framework model of cognitive activities described in the previous course on mental images serves as a departure point. Then the following are discussed: (1) how humans solve the possible distorsions between sensors and human vision; (2) how these perceptive input are integrated into mental representations; (3) the central question of confidence into visual support-systems; and (4) the related consequences for workload. NIGHT VISION DEVICES AND CHARACTERISTICS
H. Lee Task *In* AGARD, Visual Problems in Night Operations May 1992 8 p (For primary document see N94-23976 06-54)
Copyright Avail: CASI HC A02/MF A01

Night vision goggles (NVG's) are widely used to enhance visual capability during night operations. NVG's are basically composed of an objective lens which focuses an image onto the photo-cathode of an image intensifier tube which in turn produces an amplified image that is viewed through an eyepiece lens. There are several versions of NVG's in use and in development. These include the AN/PVS-Five, AN/AVS-Six, PVS-Seven, Cat's Eyes, Nite-Op, Eagle Eyes, Merlin, and others. The first section of this paper provides a brief description and characterization of each of these NVG's. There are several parameters that are used to characterize the image quality and capability of NVG's. These parameters include field-of-view (FOV), resolution, spectral sensitivity, brightness gain, distortion, magnification, optical axes alignment, image rotation, overlap, beamsplitter ratio, exit pupil diameter, eye relief, and others. Each of these is discussed in the second section of this paper. Author (revised)

NIGHT VISION GOGGLE ILLUSIONS AND VISUAL TRAINING
William E. Berkley *In* AGARD, Visual Problems in Night Operations May 1992 6 p (For primary document see N94-23976 06-54)
Copyright Avail: CASI HC A02/MF A01

Night vision goggles (NVG's) possess certain specific visual characteristics related to their limited resolution, field of view and automatic gain control. In addition, the near infrared energy to which NVG's are most sensitive has somewhat different properties as compared to visible light. These factors combine to produce certain effects, limitations and illusions not ordinarily encountered with unaided vision. NVG visual training for aircrew members is conducted with didactic presentations, terrain board simulation, video tape presentations of intensified imagery, flight simulators utilizing computer generated imagery, and actual flight with NVG's. Computer based training and an interactive videodisc are under development.

PHYSIOLOGICAL PROTECTION FOR AIRCREW AT HIGH ALTITUDES: A REVIEW OF THE LITERATURE
L. S. Goodman Apr. 1993 48 p
(DCIEM-93-13; CTN-94-60895) Copyright Avail: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada

The greater performance characteristics of modern tactical aircraft allow flight at extreme altitudes. If oxygen breathing systems should fail or the canopy seal be broken, exposure to low levels of oxygen pressure will lead to hypoxia. Unconsciousness will occur within seconds at altitudes of 60,000 ft and up. The technology of hypoxia protection for aircrew during emergency cabin decompression is beginning to address this issue; in fact, the altitude performance of modern aircraft is limited by their 1950's generation oxygen systems. The basic physiology of hypoxia is first reviewed. The use of positive pressure breathing (PPB) for emergency hypoxia protection, sufficient to allow the pilot to maintain useful consciousness until the aircraft rapidly descends to safe altitudes, is then discussed in a historical perspective. The gas-exchange physiology and mechanisms whereby the correction or reduction of hypoxia is achieved are explained. This is followed by detailed discussion of the pulmonary and cardiovascular disruptions caused by PPB. The means for preventing these disruptions are reviewed, including G-suit inflation and thoracic counterpressure garments. More recently developed PPB garment technologies are highlighted and trends in PPB garment research and development are predicted. Author (CISTI)

OPERATION FRICTION: DEVELOPMENT AND INTRODUCTION OF PERSONAL COOLING FOR CH124 SEA KING AIRCREW

L. L. M. Bossi, K. C. Glass, J. Frim, and M. J. Ballantyne Jan. 1993 61 p

(DCIEM-93-06; CTN-94-60915) Copyright Avail: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada

Sea King helicopters and aircrew were deployed to the Persian Gulf as part of Canadian support to the United Nations actions against Iraq in 1990. Due to the expected high temperatures and the requirement to operate in the aircrew chemical defense (CD) ensemble, personal cooling was required to maintain operational effectiveness. A system developed for cooling bomb disposal personnel was adapted for this purpose. This included not only manufacture and delivery within one week, but also design and implementation of CD ensemble and aircraft modifications. The cooling system included a shirt made of Nomex stretch fabric with plasticized tubing stitched throughout the inside; the tubing was connected to a pump and a bottle containing water and ice. Modifications included adapting the pump to run on aircraft power instead of battery supply. The development of doctrine, operational use of the cooling ensembles, and training of aircrew and support staff were accomplished on ship enroute to the Gulf. Physiological and operational evaluations of the cooling system show that the operational capability of the aircrews was significantly enhanced by the personal cooling system. Dressed in the full CD ensemble, the aircrews could function without being limited by heat stress. Author (CISTI)

INVESTIGATION OF TIME AND INTENSITY EFFECTS IN OPERATOR WORKLOAD AND PERFORMANCE

Jianqiao Liao and Paul Milgram Jun. 1993 181 p

(CTN-94-60927) Copyright Avail: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada

The concept of mental workload is examined and various factors affecting mental workload are discussed. Methods of mental workload measurement methods are evaluated and models of human information processing are reviewed. In a review of modeling of time and intensity domain aspects of mental workload, it is concluded that it is useful to model the human information processor as a capacity limited information channel. To test the proposed model, the performance of a simulated air traffic control (ATC) task was experimentally investigated, using NASA TLX scores to assess the subjects' mental workload. Ratings of overall mental workload were found to be sensitive to changes in the number of aircraft and the simulation update interval. High correlations were found among the six dimensions of NASA TLX. From the experimental data, a model of human performance was derived based on the concept of limited capacity. A preliminary network simulation was also developed independently, based on the assumption that the human operator could do only one task at a time. The simulation was found to predict subjects' performance well under low task demand conditions but not under high task demand conditions. It is believed that this simulation model can be greatly improved. Substantial bibliographies on mental workload are included. Author (CISTI)

CREW INTERFACE ANALYSIS: SELECTED ARTICLES ON SPACE HUMAN FACTORS RESEARCH, 1987 - 1991

Tandi Bagian, comp. Jul. 1993 137 p Sponsored by NASA. Washington Original contains color illustrations

(NASA-TM-104756; S-697; NAS 1.15:104756) Avail: CASI HC A07/MF A02; 5 functional color pages

As part of the Flight Crew Support Division at NASA, the Crew Interface Analysis Section is dedicated to the study of human factors in the manned space program. It assumes a specialized role that focuses on answering operational questions pertaining to NASA's Space Shuttle and Space Station Freedom Programs. One of the section's key contributions is to provide knowledge and information about human capabilities and limitations that promote optimal spacecraft and habitat design and use to enhance crew safety and productivity. The section provides human factors engineering for the ongoing missions as well as proposed missions that aim to put human settlements on the Moon and Mars. Research providing solutions to operational issues is the primary objective of the Crew Interface Analysis Section. The studies represent such subdisciplines as ergonomics, space habitability, man-computer interaction, and remote operator interaction. For individual titles, see N94-24186 through N94-24206.

SPACECRAFT CREW PROCEDURES FROM PAPER TO COMPUTERS

Michael ONeal and Meera Manahan *In* NASA. Johnson Space Center, Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 5-9 (For primary document see N94-24185 06-54)

(Contract NAS9-17900)

Avail: CASI HC A01/MF A02; 5 functional color pages

Large volumes of paper are launched with each Space Shuttle Mission that contain step-by-step instructions for various activities that are to be performed by the crew during the mission. These instructions include normal operational procedures and malfunction or contingency procedures and are collectively known as the Flight Data File (FDF). An example of nominal procedures would be those used in the deployment of a satellite from the Space Shuttle; a malfunction procedure would describe actions to be taken if a specific problem developed during the deployment. A new FDF and associated system is being created for Space Station Freedom. The system will be called the Space Station Flight Data File (SFDF). NASA has determined that the SFDF will be computer-based rather than paper-based. Various aspects of the SFDF are discussed. Derived from text

PROCESS AND REPRESENTATION IN GRAPHICAL DISPLAYS

Douglas J. Gillan (Lockheed Engineering and Sciences Co., Houston, TX.), Robert Lewis (Rice Univ., Houston, TX.), and Marianne Rudisill *In its* Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 10-16 (For primary document see N94-24185 06-54)

Avail: CASI HC A02/MF A02; 5 functional color pages

Our initial model of graphic comprehension has focused on statistical graphs. Like other models of human-computer interaction, models of graphical comprehension can be used by human-computer interface designers and developers to create interfaces that present information in an efficient and usable manner. Our investigation of graph comprehension addresses two primary questions: how do people represent the information contained in a data graph?; and how do they process information from the graph? The topics of focus for graphic representation concern the features into which people decompose a graph and the representations of the graph in memory. The issue of processing can be further analyzed as two questions: what overall processing strategies do people use?; and what are the specific processing skills required? Derived from text

DESIGNERS' MODELS OF THE HUMAN-COMPUTER INTERFACE

Douglas J. Gillan and Sarah D. Breedin (Lockheed Engineering and Sciences Co., Houston, TX.) *In* NASA. Johnson Space Center, Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 17-26 (For primary document see N94-24185 06-54)

(Contract NAS9-17900)

Avail: CASI HC A02/MF A02; 5 functional color pages

Understanding design models of the human-computer interface (HCI) may produce two types of benefits. First, interface development often requires input from two different types of experts: human factors specialists and software developers. Given the differences in their backgrounds and roles, human factors specialists and software developers may have different cognitive models of the HCI. Yet, they have to communicate about the interface as part of the design process. If they have different models, their interactions are likely to involve a certain amount of miscommunication. Second, the design process in general is likely to be guided by designers' cognitive models of the HCI, as well as by their knowledge of the user, tasks, and system. Designers do not start with a blank slate; rather they begin with a general model of the object they are designing. The author's approach to a design model of the HCI was to have three groups make judgments of categorical similarity about the components of an interface:

human factors specialists with HCI design experience, software developers with HCI design experience, and a baseline group of computer users with no experience in HCI design. The components of the user interface included both display components such as windows, text, and graphics, and user interaction concepts, such as command language, editing, and help. The judgments of the three groups were analyzed using hierarchical cluster analysis and Pathfinder. These methods indicated, respectively, how the groups categorized the concepts, and network representations of the concepts for each group. The Pathfinder analysis provides greater information about local, pairwise relations among concepts, whereas the cluster analysis shows global, categorical relations to a greater extent. AUTOMATED SYSTEM FUNCTION ALLOCATION AND DISPLAY FORMAT: TASK INFORMATION PROCESSING REQUIREMENTS
Mary P. Czerwinski *In* NASA. Johnson Space Center, Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 27-35 Sponsored by NASA. Washington (For primary document see N94-24185 06-54)
Avail: CASI HC A02/MF A02; 5 functional color pages

An important consideration when designing the interface to an intelligent system concerns function allocation between the system and the user. The display of information could be held constant, or 'fixed', leaving the user with the task of searching through all of the available information, integrating it, and classifying the data into a known system state. On the other hand, the system, based on its own intelligent diagnosis, could display only relevant information in order to reduce the user's search set. The user would still be left the task of perceiving and integrating the data and classifying it into the appropriate system state. Finally, the system could display the patterns of data. In this scenario, the task of integrating the data is carried out by the system, and the user's information processing load is reduced, leaving only the tasks of perception and classification of the patterns of data. Humans are especially adept at this form of display processing. Although others have examined the relative effectiveness of alphanumeric and graphical display formats, it is interesting to reexamine this issue together with the function allocation problem. Currently, Johnson Space Center is the test site for an intelligent Thermal Control System (TCS), TEXSYS, being tested for use with Space Station Freedom. Expert TCS engineers, as well as novices, were asked to classify several displays of TEXSYS data into various system states (including nominal and anomalous states). Three different display formats were used: fixed, subset, and graphical. The hypothesis tested was that the graphical displays would provide for fewer errors and faster classification times by both experts and novices, regardless of the kind of system state represented within the display. The subset displays were hypothesized to be the second most effective display format/function allocation condition, based on the fact that the search set is reduced in these displays. Both the subset and the graphic display conditions were hypothesized to be processed more efficiently than the fixed display conditions. Author (revised)

THE USE OF ANALYTICAL MODELS IN HUMAN-COMPUTER INTERFACE DESIGN
Leo Gugerty *In* NASA. Johnson Space Center, Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 36-44 (For primary document see N94-24185 06-54)
Avail: CASI HC A02/MF A02; 5 functional color pages

Recently, a large number of human-computer interface (HCI) researchers have investigated building analytical models of the user, which are often implemented as computer models. These models simulate the cognitive processes and task knowledge of the user in ways that allow a researcher or designer to estimate various aspects of an interface's usability, such as when user errors are likely to occur. This information can lead to design improvements. Analytical models can supplement design guidelines by providing designers rigorous ways of analyzing the information-processing requirements of specific tasks (i.e., task analysis). These models offer the potential of improving early designs and replacing some of the early phases of usability testing, thus reducing the cost of interface design. This paper describes some of the many analytical models that are currently being developed and evaluates the usefulness of analytical models for human-computer interface design. This paper will focus on computational, analytical models, such as the GOMS model, rather than less formal, verbal models, because the more exact predictions and task descriptions of computational models may be useful to designers. The paper also discusses some of the practical requirements for using analytical models in complex design organizations such as NASA. Derived from text

USING COMPUTER GRAPHICS TO DESIGN SPACE STATION FREEDOM VIEWING
Betty S. Goldsberry (Lockheed Engineering and Sciences Co., Houston, TX.), Buddy O. Lippert (Lockheed Engineering and Sciences Co., Houston, TX.), Sandra D. McKee (Lockheed Engineering and Sciences Co., Houston, TX.), James L. Lewis, Jr., and Francis E. Mount *In its* Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 47-51 (For primary document see N94-24185 06-54)
Avail: CASI HC A01/MF A02; 5 functional color pages

Viewing requirements were identified early in the Space Station Freedom program for both direct viewing via windows and indirect viewing via cameras and closed-circuit television (CCTV). These requirements reside in NASA Program Definition and Requirements Document (PDRD), Section 3: Space Station Systems Requirements. Currently, analyses are addressing the feasibility of direct and indirect viewing. The goal of these analyses is to determine the optimum locations for the windows, cameras, and CCTV's in order to meet established requirements, to adequately support space station assembly, and to operate on-board equipment. PLAID, a three-dimensional computer graphics program developed at NASA JSC, was selected for use as the major tool in these analyses. PLAID provides the capability to simulate the assembly of the station as well as to examine operations as the station evolves. This program has been used successfully as a tool to analyze general viewing conditions for many Space Shuttle elements and can be used for virtually all Space Station components. Additionally, PLAID provides the ability to integrate an anthropometric scale-modeled human (representing a crew member) with interior and exterior architecture. Author (revised)

A SIMULATION SYSTEM FOR SPACE STATION EXTRAVEHICULAR ACTIVITY
Jose A. Marmolejo and Chip Shepherd (Lockheed Engineering and Sciences Co., Houston, TX.) *In its* Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 52-58 (For primary document see N94-24185 06-54)
Avail: CASI HC A02/MF A02; 5 functional color pages

America's next major step into space will be the construction of a permanently manned Space Station which is currently under development and scheduled for full operation in the mid-1990's. Most of the construction of the Space Station will be performed over several flights by suited crew members during an extravehicular activity (EVA) from the Space Shuttle. Once fully operational, EVA's will be performed from the Space Station on a routine basis to provide, among other services, maintenance and repair operations of satellites currently in Earth orbit. Both voice recognition and helmet-mounted display technologies can improve the productivity of workers in space by potentially reducing the time, risk, and cost involved in performing EVA. NASA has recognized this potential and is currently developing a voice-controlled information system for Space Station EVA. Two bench-model helmet-mounted displays and an EVA simulation program have been developed to demonstrate the functionality and practicality of the system. Author (revised)

USE OF INFRARED TELEMETRY AS PART OF A NONINTRUSIVE INFLIGHT DATA COLLECTION SYSTEM TO COLLECT HUMAN FACTORS DATA
Angelo Micocci *In* NASA. Johnson Space Center, Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 59-63 (For primary document see N94-24185 06-54)
Avail: CASI HC A01/MF A02; 5 functional color pages

The objective of this paper is to present a methodology and rationale for development of a Nonintrusive Inflight Data Collection System (NIDCS) to collect Human Factors (HF) data during a space mission. These data will enable the research team to identify and resolve issues. This paper will present the background and history of the NIDCS, the methodology and techniques employed versus those in current use on Earth, initial results of the effort--including a brief description of the equipment, and, finally, a discussion of the scientific importance and possible future applications of this system elsewhere. The schema for the NIDCS includes a collection of three types of data: behavioral, physiological, and biomechanical. These will be collected using videotape of crew members' activities, bioelectric signal measurement, and measurement of kinematics and kinetics, respectively. This paper will focus on the second type of data, physiological activity as determined by changes in bioelectric potentials as crew members perform daily assignments. Author (revised)

ILLUMINATION REQUIREMENTS FOR OPERATING A SPACE REMOTE MANIPULATOR
George O. Chandlee (Lockheed Engineering and Sciences Co., Houston, TX.), Randy L. Smith (Lockheed Engineering and Sciences Co., Houston, TX.), and Charles D. Wheelwright *In its* Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 68-72 (For primary document see N94-24185 06-54)
(Contract NAS9-17900)
Avail: CASI HC A01/MF A02; 5 functional color pages

Critical issues and requirements involved in illuminating remote manipulator operations in space help establish engineering designs for these manipulators. A remote manipulator is defined as any mechanical device that is controlled indirectly or from a distance by a human operator for the purpose of performing potentially dangerous or hazardous tasks to increase safety, reliability, and efficiency. Future space flights will rely on remote manipulators for a variety of tasks including satellite repair and servicing, structural assembly, data collection and analysis, and performance of contingency tasks. Carefully designed illumination of these manipulators will assure that these tasks will be completed efficiently and successfully. Studies concerning the influence of illumination on operation of a remote manipulator are few. Available results show that illumination can influence how successfully a human operates a remote manipulator. The intent of this study was to more fully examine this topic. Author (revised)

Avail: CASI HC A01/MF A02; 5 functional color pages

Previous experience in manned space flight programs can be used to compile a data base of human factors lessons learned for the purpose of developing aids in the future design of inhabited spacecraft. The objectives are to gather information available from relevant sources, to develop a taxonomy of human factors data, and to produce a data base that can be used in the future for those people involved in the design of manned spacecraft operations. A study is currently underway at the Johnson Space Center with the objective of compiling, classifying, and summarizing relevant human factors data bearing on the lessons learned from previous manned space flights. The research reported defines sources of data, methods for collection, and proposes a classification for human factors data that may be a model for other human factors disciplines. Author (revised)

HAND CONTROLLER COMMONALITY EVALUATION PROCESS
Mark A. Stuart (Lockheed Engineering and Sciences Co., Houston, TX.), John M. Bierschwale (Lockheed Engineering and Sciences Co., Houston, TX.), Robert P. Wilmington (Lockheed Engineering and Sciences Co., Houston, TX.), Susan C. Adam (Lockheed Engineering and Sciences Co., Houston, TX.), Manuel F. Diaz (Lockheed Engineering and Sciences Co., Houston, TX.), and Dean G. Jensen *In its* Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 79-84 (For primary document see N94-24185 06-54)
Avail: CASI HC A02/MF A02; 5 functional color pages

Hand controller selection for NASA's Orbiter and Space Station Freedom is an important area of human-telerobot interface design and evaluation. These input devices will control remotely operated systems that include large crane-like manipulators (e.g., Remote Manipulator System or RMS), smaller, more dexterous manipulators (e.g., Flight Telerobotic Servicer or FTS), and free flyers (e.g., Orbital Maneuvering Vehicle or OMV). Candidate hand controller configurations for these systems vary in many ways: shape, size, number of degrees-of-freedom (DOF), operating modes, provision of force reflection, range of movement, and 'naturalness' of use. Unresolved design implementation issues remain, including such topics as how the current Orbiter RMS rotational and translational rate hand controllers compare with the proposed Space Station Freedom hand controllers, the advantages that position hand controllers offer for these applications, and whether separate hand controller configurations are required for each application. Since previous studies contain little empirical hand controller task performance data, a controlled study is needed that tests Space Station Freedom candidate hand controllers during representative tasks. This study also needs to include anthropometric and biomechanical considerations. Author (revised)

PROGRAMMABLE DISPLAY PUSHBUTTONS ON THE SPACE STATION'S TELEROBOT CONTROL PANEL
Mark A. Stuart, Randy L. Smith, and Ervette P. Moore *In* NASA. Johnson Space Center, Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 85-90 (For primary document see N94-24185 06-54)
(Contract NAS9-17900)
Avail: CASI HC A02/MF A02; 5 functional color pages

The Man-Systems Telerobotics Laboratory at NASA's Johnson Space Center and supported by Lockheed, is working to ensure that the Flight Telerobotic Servicer (FTS) to be used on the Space Shuttle (Orbiter) and the Space Station has a well designed user interface from a Human Factors perspective. The FTS, which is a project led by NASA's Goddard Space Flight Center, will be a telerobot used for Space Station construction, maintenance, and satellite repair. It will be directly controlled from workstations on the Orbiter and the Space Station and monitored from a ground workstation. The FTS will eventually evolve into a more autonomous system, but in the short-term the system will be manually operated (teleoperated) for many tasks. This emphasizes the importance of the human/telerobot interface on this system. This phase of the FTS workstation evaluation covers a preliminary study of programmable display pushbuttons (PDP's). The PDP is constructed of a matrix of directly addressable electroluminescent (EL) pixels which can be used to form dot-matrix characters. PDP's can be used to display more than one message and to control more than one function. Since the PDP's have these features, then a single PDP may possibly replace the use of many single-function pushbuttons, rotary switches, and toggle switches, thus using less panel space. It is of interest to determine if PDP's can be used to adequately perform complex hierarchically structured task sequences. The objective of this investigation was to compare the performance of experienced and inexperienced Remote Manipulator System (RMS) operators while performing an RMS like task on simulated PDP and non-PDP computer prototypes so that guidelines governing the use of programmable display pushbuttons on the FTS workstation could be created. The functionality of the RMS on the Orbiter was used as a model for this evaluation since the functionality

of the FTS at the time of this writing has not been solidified.

SPEECH VERSUS MANUAL CONTROL OF CAMERA FUNCTIONS DURING A TELEROBOTIC TASK
John M. Bierschwale, Carlos E. Sampaio, Mark A. Stuart, and Randy L. Smith *In* NASA. Johnson Space Center, Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 91-97 (For primary document see N94-24185 06-54)
(Contract NAS9-17900)
Avail: CASI HC A02/MF A02; 5 functional color pages

This investigation has evaluated the voice-commanded camera control concept. For this particular task, total voice control of continuous and discrete camera functions was significantly slower than manual control. There was no significant difference between voice and manual input for several types of errors. There was not a clear trend in subjective preference of camera command input modality. Task performance, in terms of both accuracy and speed, was very similar across both levels of experience.

SPACE STATION FREEDOM COUPLING TASKS: AN EVALUATION OF THEIR TELEROBOTIC AND EVA COMPATIBILITY
Carlos E. Sampaio, John M. Bierschwale, Terence F. Fleming, and Mark A. Stuart *In* NASA. Johnson Space Center, Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 98-103 (For primary document see N94-24185 06-54)
(Contract NAS9-17900)
Avail: CASI HC A02/MF A02; 5 functional color pages

Of the couplings included in this study, several design components were found to be of interest. With respect to the operation of the couplings, the various concepts resulted in differing reactions from the four subjects who participated in this study. The purpose of this study was not to conceive the final coupling design. Rather, it was intended as a step along an interactive process. The newly modified coupling will be included in a series of further controlled, as well as subjective, evaluations. This part of the ongoing work in the Remote Operator Interaction Laboratory (ROIL) designed to enhance the overall interface by improving design at both the teleoperator and telerobot ends of the system.

THE EFFECTS OF SPATIALLY DISPLACED VISUAL FEEDBACK ON REMOTE MANIPULATOR PERFORMANCE
Randy L. Smith and Mark A. Stuart *In* NASA. Johnson Space Center, Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 104-110 (For primary document see N94-24185 06-54)
(Contract NAS9-17900)
Avail: CASI HC A02/MF A02; 5 functional color pages

The results of this evaluation have important implications for the arrangement of remote manipulation worksites and the design of workstations for telerobot operations. This study clearly illustrates the deleterious effects that can accompany the performance of remote manipulator tasks when viewing conditions are less than optimal. Future evaluations should emphasize telerobot camera locations and the use of image/graphical enhancement techniques in an attempt to lessen the adverse effects of displaced visual feedback. An important finding in this evaluation is the extent to which results from previously performed direct manipulation studies can be generalized to remote manipulation studies. Even though the results obtained were very similar to those of the direct manipulation evaluations, there were differences as well. This evaluation has demonstrated that generalizations to remote manipulation applications based upon the results of direct manipulation studies are quite useful, but they should be made cautiously.

SIMULATION OF THE HUMAN-TELEROBOT INTERFACE ON THE SPACE STATION
Mark A. Stuart and Randy L. Smith *In* NASA. Johnson Space Center, Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 111-115 (For primary document see N94-24185 06-54)
(Contract NAS9-17900)
Avail: CASI HC A02/MF A02; 5 functional color pages

Many issues remain unresolved concerning the components of the human-telerobot interface presented in this work. It is critical that these components be optimally designed and arranged to ensure, not only that the overall system's goals are met, but but that the intended end-user has been optimally accommodated. With sufficient testing and evaluation throughout the development cycle, the selection of the components to use in the final telerobotic system can promote efficient, error-free performance. It is recommended that whole-system simulation with full-scale mockups be used to help design the human-telerobot interface. It is contended that the use of simulation can facilitate this design and evaluation process.

QUANTITATIVE ASSESSMENT OF HUMAN MOTION USING VIDEO MOTION ANALYSIS
John D. Probe *In* NASA. Johnson Space Center, Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 119-121 (For primary document see N94-24185 06-54)
Avail: CASI HC A01/MF A02; 5 functional color pages

In the study of the dynamics and kinematics of the human body a wide variety of technologies has been developed. Photogrammetric techniques are well documented and are known to provide reliable positional data from recorded images. Often these techniques are used in conjunction with cinematography and videography for analysis of planar motion, and to a lesser degree three-dimensional motion. Cinematography has been the most widely used medium for movement analysis. Excessive operating costs and the lag time required for film development, coupled with recent advances in video technology, have allowed video based motion analysis systems to emerge as a cost effective method of collecting and analyzing human movement. The Anthropometric and Biomechanics Lab at Johnson Space Center utilizes the video based Ariel Performance Analysis System (APAS) to develop data on shirtsleeved and space-suited human performance in order to plan efficient on-orbit intravehicular and extravehicular activities. APAS is a fully integrated system of hardware and software for biomechanics and the analysis of human performance and generalized motion measurement. Major components of the complete system include the video system, the AT compatible computer, and the proprietary software.

REACH PERFORMANCE WHILE WEARING THE SPACE SHUTTLE LAUNCH AND ENTRY SUIT DURING EXPOSURE TO LAUNCH ACCELERATIONS
James P. Bagian, Michael C. Greenisen, Lauren E. Schafer (Lockheed Engineering and Sciences Co., Houston, TX.), John D. Probe (Lockheed Engineering and Sciences Co., Houston, TX.), and Robert W. Krutz, Jr. (Krug International, Houston, TX.) *In its* Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 122-125 (For primary document see N94-24185 06-54)
Avail: CASI HC A01/MF A02; 5 functional color pages

Crewmen aboard the Space Shuttle are subjected to accelerations during ascent (the powered flight phase of launch) which range up to +3 G(sub x). Despite having 33 missions and nine years experience, not to mention all the time spent in development prior to the first flight, no truly quantitative reach study wearing actual crew equipment, using actual Shuttle seats and restraints has ever been done. What little information exists on reach performance while under acceleration has been derived primarily from subjective comments gathered retrospectively from Shuttle flight crews during their post mission debrief. This lack of reach performance data has resulted in uncertainty regarding emergency procedures that can realistically be performed during and actual Shuttle ascent versus what is practiced in the ground-fixed and motion-based Shuttle Simulators. With the introduction on STS-26 of the current Shuttle escape system, the question of reach performance under launch accelerations was once again raised. The escape system's requirement that each crewman wear a Launch/Entry Suit (LES), parachute harness, and parachute were all anticipated to contribute to a further degradation of reach performance during Shuttle ascent accelerations.

In order to answer the reach performance question in a quantitative way, a photogrammetric method was chosen so that the actual reach values and associated envelopes could be captured. This would allow quantitative assessment of potential task performance impact and identify areas where changes to our Shuttle ascent emergency procedures might be required. Also, such a set of reach values would be valid for any similar acceleration profile using the same crew equipment. Potential Space Station applications of this data include predicting reach performance during Assured Crew Return Vehicle (ACRV) operations. Derived from text

DEVELOPMENT OF BIOMECHANICAL MODELS FOR HUMAN FACTORS EVALUATIONS

Barbara Woolford, Abhilash Pandya (Lockheed Engineering and Sciences Co., Houston, TX.), and James Maida (Lockheed Engineering and Sciences Co., Houston, TX.) *In its* Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 126-131
(For primary document see N94-24185 06-54)
Avail: CASI HC A02/MF A02; 5 functional color pages

Computer aided design (CAD) techniques are now well established and have become the norm in many aspects of aerospace engineering. They enable analytical studies, such as finite element analysis, to be performed to measure performance characteristics of the aircraft or spacecraft long before a physical model is built. However, because of the complexity of human performance, CAD systems for human factors are not in widespread use. The purpose of such a program would be to analyze the performance capability of a crew member given a particular environment and task. This requires the design capabilities to describe the environment's geometry and to describe the task's requirements, which may involve motion and strength. This in turn requires extensive data on human physical performance which can be generalized to many different physical configurations. PLAID is developing into such a program. Begun at Johnson Space Center in 1977, it was started to model only the geometry of the environment. The physical appearance of a human body was generated, and the tool took on a new meaning as fit, access, and reach could be checked. Specification of fields-of-view soon followed. This allowed PLAID to be used to predict what the Space Shuttle cameras or crew could see from a given point. Derived from text

ESTABLISHING A RELATIONSHIP BETWEEN MAXIMUM TORQUE PRODUCTION OF ISOLATED JOINTS TO SIMULATE EVA RATCHET PUSH-PULL MANEUVER: A CASE STUDY

Abhilash Pandya (Lockheed Engineering and Sciences Co., Houston, TX.), James Maida (Lockheed Engineering and Sciences Co., Houston, TX.), Scott Hasson (Texas Univ., Houston.), Michael Greenisen, and Barbara Woolford *In its* Crew Interface Analysis: Selected Articles on Space Human Factors Research, 1987 - 1991 Jul. 1993 p 132-135 (For primary document see N94-24185 06-54)
Avail: CASI HC A01/MF A02; 5 functional color pages

As manned exploration of space continues, analytical evaluation of human strength characteristics is critical. These extraterrestrial environments will spawn issues of human performance which will impact the designs of tools, work spaces, and space vehicles. Computer modeling is an effective method of correlating human biomechanical and anthropometric data with models of space structures and human work spaces. The aim of this study is to provide biomechanical data from isolated joints to be utilized in a computer modeling system for calculating torque resulting from any upper extremity motions: in this study, the ratchet wrench push-pull operation (a typical extravehicular activity task). Established here are mathematical relationships used to calculate maximum torque production of isolated upper extremity joints. These relationships are a function of joint angle and joint velocity. Work has been initiated to create a new protection organization for warning and mapping in radioactive fallout situations in Sweden. This organization should be the same in peace, crises and war and be able to deal with fallout, both from accidents in nuclear power stations and nuclear weapons explosions. The two present organizations, one for peace and one for war, will be substituted by the common organization. The first steps in this work are described. A description of the two present organizations is made and they are compared for two different fallout levels. This comparison is evaluated and some proposals are made for the local and regional organizations level. ESA

COMPUTER CONTROL OF AN ELECTRO-MECHANCIAL REGULATOR FOR PROVIDING POSITIVE PRESSURE BREATHING AND AN ELECTRONIC G-VALVE FOR HUMAN +Gz RESEARCH

M. Pecaric, F. Buick, and J. Maloan Jan. 1993 48 p
(DCIEM-93-05; CTN-94-60912) Copyright Avail: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada

Electronic G-valves and breathing regulators are being incorporated into some life support systems designed for aircrew protection. An electronically controlled G-valve and electromechanical breathing regulator were obtained and a prototype, computer controlled, life support system interface was developed and evaluated in the centrifuge. The interface was used to provide different schedules for G-suit inflation and positive pressure breathing during +Gz (PBG). Output pressures from both a G-valve and breathing regulator were driven by a voltage proportional to the centrifuge +Gz level. The required voltages were calculated from the pressure schedule. The schedules and performance of the G-valve and breathing regulator were also evaluated at different +Gz onset rates. G-suit pressure and PBG level accurately tracked the +Gz level. Outputs of both G-valve and breathing regulator reached maximum pressure within 0.2 seconds of reaching the peak +Gz level. The greatest tracking errors occurred during onset to peak +Gz with 3.0 +Gz/second profiles, most of the error being attributed to the slow response of the controller software. Author (CISTI)

CONCEPTUAL DESIGN OF A DEVICE TO MEASURE HAND SWELLING IN A MICRO-GRAVITY ENVIRONMENT

Christopher L. Hysinger 12 Mar. 1993 19 p
(Contract NASw-4435)
(NASA-CR-195509; NAS 1.26:195509) Avail: CASI HC A03/MF A01

In the design of pressurized suits for use by astronauts in space, proper fit is an important consideration. One particularly difficult aspect of the suit design is the design of the gloves. If the gloves of the suit do not fit properly, the grip strength of the astronaut can be decreased by as much as fifty percent. These gloves are designed using an iterative process and can cost over 1.5 million dollars. Glove design is further complicated by the way the body behaves in a micro-gravity environment. In a micro-gravity setting, fluid from the lower body tends to move into the upper body. Some of this fluid collects in the hands and causes the hands to swell. Therefore, a pair of gloves that fit well on earth may not fit well when they are used in space. The conceptual design process for a device which can measure the swelling that occurs in the hands in a micro-gravity environment is described. This process involves developing a specifications list and function structure for the device and generating solution variants for each of the sub functions. The solution variants are then filtered, with the variants that violate any of the specifications being discarded. After acceptable solution variants are obtained, they are combined to form design concepts. These design concepts are evaluated against a set of criteria and the design concepts are ranked in order of preference. Through this process, the two most plausible design concepts were an ultrasonic imaging technique and a laser mapping technique. Both of these methods create a three dimensional model of the hand, from which the amount of swelling can be determined. In order to determine which of the two solutions will actually work best, a further analysis will need to be performed. Author (revised)

In space, where the body does only a fraction of work it does on earth, muscle atrophy is a major concern. The bones and the muscles will begin to deteriorate after a short stay in weightlessness. Bone decalcification appears to be a major problem with extensive living in microgravity. Resistance exercise is not only essential to prevent muscle atrophy in space, it also helps to keep bone decalcification in check. For a space station, where the astronauts are expected to live for months at a time, exercise is especially important. Experts recommend about an hour and a half to two hours of exercise per day to keep the muscles in good condition in microgravity. The exercises will not only keep the astronauts in excellent physical condition, it will also make it easier for them to readjust to earth's gravity on return. The stationary bicycle and the treadmill have been the astronauts' primary sources of exercise since the 1970's. The major problem with both the stationary bicycle and the treadmill is that while they may keep the leg muscles from deteriorating in microgravity, they do little for muscles in the upper body. The National Aeronautics and Space Administration (NASA) is currently developing a full-body dynamometer (FBD), which will provide the astronauts with a full-body workout. It will also test the astronauts for muscle atrophy and rehabilitate the weakened muscle. The specification and the function structure for the FBD is presented. Author (revised)

CONCEPTS AND EMBODIMENT DESIGN OF A REENTRY RECUMBENT SEATING SYSTEM FOR THE NASA SPACE SHUTTLE
Scott McMillan, Brent Looby, Chris Devany, Chris Chudej, and Barry Brooks 3 May 1993 53 p
(Contract NASw-4435)
(NASA-CR-195504; NAS 1.26:195504) Avail: CASI HC A04/MF A01

This report deals with the generation of a recumbent seating system which will be used by NASA to shuttle astronauts from the Russian space station Mir. We begin by examining the necessity for designing a special couch for the returning astronauts. Next, we discuss the operating conditions and constraints of the recumbent seating system and provide a detailed function structure. After working through the conceptual design process, we came up with ten alternative designs which are presented in the appendices. These designs were evaluated and weighted to systematically determine the best choice for embodiment design. A detailed discussion of all components of the selected system follows with design calculations for the seat presented in the appendices. The report concludes with an evaluation of the resulting design and recommendations for further development. Author

MICROBIAL BIOFILM FORMATION AND ITS CONSEQUENCES FOR THE CELSS PROGRAM Final Report
R. Mitchell 31 Jan. 1994 4 p
(Contract NCC2-628)
(NASA-CR-195146; NAS 1.26:195146) Avail: CASI HC A01/MF A01

A major goal of the Controlled Ecology Life Support System (CELSS) program is to provide reliable and efficient life support systems for long-duration space flights. A principal focus of the program is on the growth of higher plants in growth chambers. These crops should be grown without the risk of damage from microbial contamination. While it is unlikely that plant pathogens will pose a risk, there are serious hazards associated with microorganisms carried in the nutrient delivery systems and in the atmosphere of the growth chamber. Our experience in surface microbiology showed that colonization of surfaces with microorganisms is extremely rapid even when the inoculum is small. After initial colonization extensive biofilms accumulate on moist surfaces. These microbial films metabolize actively and slough off continuously to the air and water. During plant growth in the CELSS program, microbial biofilms have the potential to foul sensors and to plug nutrient delivery systems. In addition both metabolic products of microbial growth and degradation products of materials being considered for use as nutrient reservoirs and for delivery are likely sources of chemicals known to adversely affect plant growth. DESIGN OF A RECUMBENT SEATING SYSTEM
Scott Croyle, Jose DeLaRosa, Daren George, Cathy Hinkle, and Stephen Karas 3 May 1993 61 p
(Contract NASw-4435)
(NASA-CR-195503; NAS 1.26:195503) Avail: CASI HC A04/MF A01

Future space shuttle missions presented by NASA might require the shuttle to rendezvous with the Russian space station Mir for the purpose of transporting astronauts back to earth. Due to the atrophied state of these astronauts, a special seating system must be designed for their transportation. The main functions of this seating system are to support and restrain the astronauts during normal reentry flight and to dampen some of the loading that might occur in a crash situation. Through research, the design team developed many concept variants for these functional requirements. By evaluating each variant, the concepts were eliminated until the four most attractive designs remained. The team used a decision matrix to determine the best concept to carry through embodiment. This concept involved using struts for support during reentry flight and a spring damper/shock absorber system to dampen crash landing loads. The embodiment design process consisted of defining the layout of each of the main functional components, specifically, the seat structure and the strut structure. Through the use of MCS/pal two, the design was refined until it could handle all required loads and dampen to the forces specified. The auxiliary function carriers were then considered. Following the design of these components, the complete final layout could be determined. It is concluded that the final design meets all specifications outlined in the conceptual design. The main advantages of this design are its low weight, simplicity, and large amount of function sharing between different components. The disassembly of this design could potentially present a problem because of time and size constraints involved. Overall, this design meets or exceeds all functional requirements. Author (revised)

PILOT-VEHICLE INTERFACE HANDBOOK, CHAPTER 19. VOLUME 2: DIGITAL SYSTEMS VALIDATION
L. Harrison, J. Janowitz, and M. Castronuovo Nov. 1993 118 p
(Contract DTFA03-89-C-0043)
(DOT/FAA/CT-88/10-Vol-2) Avail: CASI HC A06/MF A02

The cockpits of the early transport aircraft were quite different from those produced today. Older cockpits contained numerous 'steam gauge' style indicators. As technology advanced, these older electromechanical indicators were gradually replaced by newer, more reliable digital systems. Digital flight control and avionic systems are being used increasingly in modern aircraft. This trend yields cockpits of greater complexity and has swelled the amount of information with which the crew must deal. The way the pilot controls and monitors the state of the aircraft has also been greatly influenced by the increased use of digital systems. Additionally, new methods of aircraft system monitoring and control are being researched and implemented. These systems use new display technology, programmable display formats, voice input and output, and other new input and control devices. Systems and their cockpit interfaces were added as technological advances were made and new requirements generated. The human interface was given little consideration in the layout of the cockpit. Human qualities and failure modes were not taken into account in the cockpit design process. As the number of systems, components, indicators, and switches multiplied, the potential for error also grew. The emphasis of this report is on civil transport aircraft. This includes technologies such as display, control, and design methodologies, along with human factors concerns. The report consists of four sections: civil transport cockpit, cockpit standards, cockpit technology, and cockpit human factors. This report is to serve as a guide to Certification Engineers who are faced with the task of certification of new cockpit technologies. Author (revised)

SPECIFICATION LIST AND FUNCTION STRUCTURE FOR A FULL-BODY DYNAMOMETER TO BE USED ABOARD SPACE STATION FREEDOM
Robert McMahan 19 Feb. 1993 11 p
(Contract NASw-4435)
(NASA-CR-195508; NAS 1.26:195508) Avail: CASI HC A03/MF A01

NASA has a need for a machine which can be used as an exercise device and as an instrument to measure an astronaut's muscle performance. The purpose of the exercise device is to work various muscle groups of the astronaut to prevent muscle atrophy, the loss of muscle strength and mass from prolonged exposure to a microgravity environment. The measurement part of the machine will be used to collect data on the strength and power of the astronaut's muscle groups to be used in studies examining the effects of prolonged space inhabitation. The principle device used in this machine to both exercise and measure muscle performance is the dynamometer. The dynamometer converts electrical energy to mechanical energy and mechanical energy to electrical energy or signals. The task of the designer will be to incorporate a dynamometer into a device which can meet all of the needs discussed above. This memorandum has two sections which clarify the design task of producing a full-body dynamometer. The first section is a specification list. The specification list provides the requirements that the designer must meet in his/her design. The second part is a function structure. The function structure shows graphically the flow of material, energy, and information through the machine. These two items will be used by the designer in the design process for the full-body dynamometer. Derived from text

DESIGN AND SIMULATION OF EVA TOOLS FOR FIRST SERVICING MISSION OF HST Semiannual Report, 15 Jan. - 14 Jul. 1993
Dipak Naik and P. H. DeHoff 14 Jul. 1993 12 p
(Grant NAG5-2038)
(NASA-CR-194784; NAS 1.26:194784; TR-ME/ES-93-2) Avail: CASI HC A03/MF A01

The Hubble Space Telescope (HST) was launched into near-earth orbit by the space shuttle Discovery on April 24, 1990. The payload of two cameras, two spectrographs, and a high-speed photometer is supplemented by three fine-guidance sensors that can be used for astronomy as well as for star tracking. A widely reported spherical aberration in the primary mirror causes HST to produce images of much lower quality than intended. A space shuttle repair mission in late 1993 will install small corrective mirrors that will restore the full intended optical capability of the HST. The first servicing mission (FSM) will involve considerable extravehicular activity (EVA). It is proposed to design special EVA tools for the FSM. This report includes details of the data acquisition system being developed to test the performance of the various EVA tools in ambient as well as simulated space environment. Author (revised)

CONCEPTUAL DESIGN OF AN ASTRONAUT HAND ANTHROPOMETRY DEVICE
Robert McMahan 12 Mar. 1993 18 p
(Contract NASw-4435)
(NASA-CR-195490; NAS 1.26:195490) Avail: CASI HC A03/MF A01

In a microgravity environment, fluid equalizes throughout the body, causing the upper body to swell. This causes the hands to swell which can cause problems for astronauts trying to do work in pressurized EVA (extravehicular activity) gloves. To better design these gloves, accurate measurements of the astronauts swollen hands are needed. Five concepts were developed in this report from an original field of 972 possible concepts. These five concepts were based on mold impression, ultrasound, laser topography, white light photography, and video imaging. From a decision matrix based on nine weighted criteria, the video imaging technique was found to be the best design to pursue. Author (revised)

INFRARED SENSORS AND SYSTEMS FOR ENHANCED VISION/AUTONOMOUS LANDING APPLICATIONS c74
J. Richard Kerr *In* NASA. Ames Research Center, Proceedings of the Workshop on Augmented Visual Display (AVID) Research Dec. 1993 p 5-27 (For primary document see N94-25490 06-54)
Avail: CASI HC A03/MF A04

There exists a large body of data spanning more than two decades, regarding the ability of infrared imagers to 'see' through fog, i.e., in Category III weather conditions. Much of this data is anecdotal, highly specialized, and/or proprietary. In order to determine the efficacy and cost effectiveness of these sensors under a variety of climatic/weather conditions, there is a need for systematic data spanning a significant range of slant-path scenarios. These data should include simultaneous video recordings at visible, midwave (3-5 microns), and longwave (8-12 microns) wavelengths, with airborne weather pods that include the capability of determining the fog droplet size distributions. Existing data tend to show that infrared is more effective than would be expected from analysis and modeling. It is particularly more effective for inland (radiation) fog as compared to coastal (advection) fog, although both of these archetypes are oversimplifications. In addition, as would be expected from droplet size vs wavelength considerations, longwave outperforms midwave, in many cases by very substantial margins. Longwave also benefits from the higher level of available thermal energy at ambient temperatures. The principal attraction of midwave sensors is that staring focal plane technology is available at attractive cost-performance levels. However, longwave technology such as that developed at FLIR Systems, Inc. (FSI), has achieved high performance in small, economical, reliable imagers utilizing serial-parallel scanning techniques. In addition, FSI has developed dual-waveband systems particularly suited for enhanced vision flight testing. These systems include a substantial, embedded processing capability which can perform video-rate image enhancement and multisensor fusion. This is achieved with proprietary algorithms and includes such operations as real-time histograms, convolutions, and fast Fourier transforms. Author (revised)

SYNTHETIC VISION SYSTEM FLIGHT TEST RESULTS AND LESSONS LEARNED c53
Jeffrey Radke *In* NASA. Ames Research Center, Proceedings of the Workshop on Augmented Visual Display (AVID) Research Dec. 1993 p 29-45 (For primary document see N94-25490 06-54)
Avail: CASI HC A03/MF A04

Honeywell Systems and Research Center developed and demonstrated an active 35 GHz Radar Imaging system as part of the FAA/USAF/Industry sponsored Synthetic Vision System Technology Demonstration (SVSTD) Program. The objectives of this presentation are to provide a general overview of flight test results, a system level perspective that encompasses the efforts of the SVSTD and Augmented Visual Display (AVID) programs, and more importantly, provide the AVID workshop participants with Honeywell's perspective on the lessons that were learned from the SVS flight tests. One objective of the SVSTD program was to explore several known system issues concerning radar imaging technology. The program ultimately resolved some of these issues, left others open, and in fact created several new concerns. In some instances, the interested community has drawn improper conclusions from the program by globally attributing implementation specific issues to radar imaging technology in general. The motivation for this presentation is therefore to provide AVID researchers with a better understanding of the issues that truly remain open, and to identify the perceived issues that are either resolved or were specific to Honeywell's implementation. The 94 GHz MMW airborne radar system that provides a runway image in adverse weather conditions is now undergoing tests at Wright-Patterson Air Force Base (WPAFB). This system, which consists of a solid state FMCW transceiver, antenna, and digital signal processor, has an update rate of 10 times per second, 0.35x azimuth resolution and up to 3.5 meter range resolution. The radar B scope (range versus azimuth) image, once converted to C scope (elevation versus azimuth), is compatible with the standard TV presentation and can be displayed on the Head Up Display (HUD) or Head Down Display (HDD) to aid the pilot during landing and takeoff in limited visibility conditions. Millimeter-wave hardware systems are being developed. Our approach begins with identifying and defining the applications. System requirements are then specified based on mission needs using our end-to-end performance model. The model was benchmarked against existing data bases and, where data is deficient, it is acquired via field measurements. The derived system requirements are then validated with the appropriate field measurements using our imaging testbeds and hardware breadboards. The result is a final system that satisfies all the requirements of the target mission. Author (revised)

Avail: CASI HC A03/MF A04

IRGen is a modeling system which creates three-dimensional IR data bases for real-time simulation of thermal IR sensors. Starting from a visual data base, IRGen computes the temperature and radiance of every data base surface with a user-specified thermal environment. The predicted gray shade of each surface is then computed from the user specified sensor characteristics. IRGen is based on first-principles models of heat transport and heat flux sources, and it accurately simulates the variations of IR imagery with time of day and with changing environmental conditions. The starting point for creating an IRGen data base is a visual faceted data base, in which every facet has been labeled with a material code. This code is an index into a material data base which contains surface and bulk thermal properties for the material. IRGen uses the material properties to compute the surface temperature at the specified time of day. IRGen also supports image generator features such as texturing and smooth shading, which greatly enhance image realism. Author

THE RADAR IMAGE GENERATION (RIG) MODEL c32
Anthony J. Stenger *In* NASA. Ames Research Center, Proceedings of the Workshop on Augmented Visual Display (AVID) Research Dec. 1993 p 121-131 (For primary document see N94-25490 06-54)
Avail: CASI HC A03/MF A04

RIG is a modeling system which creates synthetic aperture radar (SAR) and inverse SAR images from 3-D faceted data bases. RIG is based on a physical optics model and includes the effects of multiple reflections. Both conducting and dielectric surfaces can be modeled; each surface is labeled with a material code which is an index into a data base of electromagnetic properties. The inputs to the program include the radar processing parameters, the target orientation, the sensor velocity, and (for inverse SAR) the target angle rates. The current version of RIG can be run on any workstation, however, it is not a real-time model. We are considering several approaches to enable the program to generate realtime radar imagery. In addition to its image generation function, RIG can also generate radar cross-section (RCS) plots as well as range and doppler radar return profiles. Author

ADVANCED RADIOMETRIC AND INTERFEROMETRIC MILIMETER-WAVE SCENE SIMULATIONS c32
B. I. Hauss, P. J. Moffa, W. G. Steele, H. Agravante, R. Davidheiser, T. Samec, and S. K. Young *In* NASA. Ames Research Center, Proceedings of the Workshop on Augmented Visual Display (AVID) Research Dec. 1993 p 133-162 (For primary document see N94-25490 06-54)
Avail: CASI HC A03/MF A04

Smart munitions and weapons utilize various imaging sensors (including passive IR, active and passive millimeter-wave, and visible wavebands) to detect/identify targets at short standoff ranges and in varied terrain backgrounds. In order to design and evaluate these sensors under a variety of conditions, a high-fidelity scene simulation capability is necessary. Such a capability for passive millimeter-wave scene simulation exists at TRW. TRW's Advanced Radiometric Millimeter-Wave Scene Simulation (ARMSS) code is a rigorous, benchmarked, end-to-end passive millimeter-wave scene simulation code for interpreting millimeter-wave data, establishing scene signatures and evaluating sensor performance. In passive millimeter-wave imaging, resolution is limited due to wavelength and aperture size. Where high resolution is required, the utility of passive millimeter-wave imaging is confined to short ranges. Recent developments in interferometry have made possible high resolution applications on military platforms. Interferometry or synthetic aperture radiometry allows the creation of a high resolution image with a sparsely filled aperture. Borrowing from research work in radio astronomy, we have developed and tested at TRW scene reconstruction algorithms that allow the recovery of the scene from a relatively small number of spatial frequency components. In this paper, the TRW modeling capability is described and numerical results are presented. Derived from text

The visual display expected to be generated by a Passive Millimeter Wave (PMMW) camera and sensor system has been simulated on a Silicon Graphics IRIS workstation at the NASA Langley Research Center (LaRC). The low resolution of the sensor has been simulated by graphically manipulating the scene as it is being drawn by the IRIS in real time. Camera field of view, sensor resolution, and sensor update rate are the controllable parameters. Physical effects such as lens model, radome effects, and noise have not been included at this time. An approximate dynamic model of the atmospheric phenomenology has been included which generates the gray-scale intensity values in real time for the simulated image. The gray-scale values are proportional to temperature. A snapshot capability which captures individual image frames during real-time operation has been included. These images were used to validate the approximate phenomenology model against a more rigorous physical model. Author

The purpose of the engineering workstation is to provide an environment for rapid prototyping and evaluation of fusion and image processing algorithms. Ideally, the algorithms are designed to optimize the extraction of information that is useful to a pilot for all phases of flight operations. Successful design of effective fusion algorithms depends on the ability to characterize both the information available from the sensors and the information useful to a pilot. The workstation is comprised of subsystems for simulation of sensor-generated images, image processing, image enhancement, and fusion algorithms. As such, the workstation can be used to implement and evaluate both short-term solutions and long-term solutions. The short-term solutions are being developed to enhance a pilot's situational awareness by providing information in addition to his direct vision. The long term solutions are aimed at the development of complete synthetic vision systems. One of the important functions of the engineering workstation is to simulate the images that would be generated by the sensors. The simulation system is designed to use the graphics modeling and rendering capabilities of various workstations manufactured by Silicon Graphics Inc. The workstation simulates various aspects of the sensor-generated images arising from phenomenology of the sensors. In addition, the workstation can be used to simulate a variety of impairments due to mechanical limitations of the sensor placement and due to the motion of the airplane. Although the simulation is currently not performed in real-time, sequences of individual frames can be processed, stored, and recorded in a video format. In that way, it is possible to examine the appearance of different dynamic sensor-generated and fused images. Author (revised)

EXPANSION-BASED PASSIVE RANGING c04
Yair Barniv *In its* Proceedings of the Workshop on Augmented Visual Display (AVID) Research Dec. 1993 p 235-286 (For primary document see N94-25490 06-54)
Avail: CASI HC A04/MF A04

This paper describes a new technique of passive ranging which is based on utilizing the image-plane expansion experienced by every object as its distance from the sensor decreases. This technique belongs in the feature/object-based family. The motion and shape of a small window, assumed to be fully contained inside the boundaries of some object, is approximated by an affine transformation. The parameters of the transformation matrix are derived by initially comparing successive images, and progressively increasing the image time separation so as to achieve much larger triangulation baseline than currently possible. Depth is directly derived from the expansion part of the transformation. To a first approximation, image-plane expansion is independent of image-plane location with respect to the focus of expansion (FOE) and of platform maneuvers. Thus, an expansion-based method has the potential of providing a reliable range in the difficult image area around the FOE. In areas far from the FOE the shift parameters of the affine transformation can provide more accurate depth information than the expansion alone, and can thus be used similarly to the way they have been used in conjunction with the Inertial Navigation Unit (INU) and Kalman filtering. However, the performance of a shift-based algorithm, when the shifts are derived from the affine transformation, would be much improved compared to current algorithms because the shifts--as well as the other parameters--can be obtained between widely separated images. Thus, the main advantage of this new approach is that, allowing the tracked window to expand and rotate, in addition to moving laterally, enables one to correlate images over a very long time span which, in turn, translates into a large spatial baseline resulting in a proportionately higher depth accuracy. MULTIPLE-CAMERA/MOTION STEREOSCOPY FOR RANGE ESTIMATION IN HELICOPTER FLIGHT
Phillip N. Smith, Banavar Sridhar, and Raymond E. Suorsa *In its* Proceedings of the Workshop on Augmented Visual Display (AVID) Research Dec. 1993 p 287-291 (For primary document see N94-25490 06-54)
Avail: CASI HC A01/MF A04

Aiding the pilot to improve safety and reduce pilot workload by detecting obstacles and planning obstacle-free flight paths during low-altitude helicopter flight is desirable. Computer vision techniques provide an attractive method of obstacle detection and range estimation for objects within a large field of view ahead of the helicopter. Previous research has had considerable success by using an image sequence from a single moving camera to solving this problem. The major limitations of single camera approaches are that no range information can be obtained near the instantaneous direction of motion or in the absence of motion. These limitations can be overcome through the use of multiple cameras. This paper presents a hybrid motion/stereo algorithm which allows range refinement through recursive range estimation while avoiding loss of range information in the direction of travel. A feature-based approach is used to track objects between image frames. An extended Kalman filter combines knowledge of the camera motion and measurements of a feature's image location to recursively estimate the feature's range and to predict its location in future images. Performance of the algorithm will be illustrated using an image sequence, motion information, and independent range measurements from a low-altitude helicopter flight experiment. Author (revised)

We describe a model-based vision system to assist pilots in landing maneuvers under restricted visibility conditions. The system was designed to analyze image sequences obtained from a Passive Millimeter Wave (PMMW) imaging system mounted on the aircraft to delineate runways/taxiways, buildings, and other objects on or near runways. PMMW sensors have good response in a foggy atmosphere; but, their spatial resolution is very low. However, additional data such as airport model and approximate position and orientation of aircraft are available. We exploit these data to guide our model-based system to locate objects in the low resolution image and generate warning signals to alert the pilots. We also derive analytical expressions for the accuracy of the camera position estimate obtained by detecting the position of known objects in the image. Author (revised)

DCT QUANTIZATION MATRICES VISUALLY OPTIMIZED FOR INDIVIDUAL IMAGES **c74**

Andrew B. Watson *In its* Proceedings of the Workshop on Augmented Visual Display (AVID) Research Dec. 1993 p 363-377 (For primary document see N94-25490 06-54)

Avail: CASI HC A03/MF A04

This presentation describes how a vision model incorporating contrast sensitivity, contrast masking, and light adaptation is used to design visually optimal quantization matrices for Discrete Cosine Transform image compression. The Discrete Cosine Transform (DCT) underlies several image compression standards (JPEG, MPEG, H.261). The DCT is applied to 8x8 pixel blocks, and the resulting coefficients are quantized by division and rounding. The 8x8 'quantization matrix' of divisors determines the visual quality of the reconstructed image; the design of this matrix is left to the user. Since each DCT coefficient corresponds to a particular spatial frequency in a particular image region, each quantization error consists of a local increment or decrement in a particular frequency. After adjustments for contrast sensitivity, local light adaptation, and local contrast masking, this coefficient error can be converted to a just-noticeable-difference (jnd). The jnd's for different frequencies and image blocks can be pooled to yield a global perceptual error metric. With this metric, we can compute for each image the quantization matrix that minimizes the bit-rate for a given perceptual error, or perceptual error for a given bit-rate. Implementation of this system demonstrates its advantages over existing techniques. A unique feature of this scheme is that the quantization matrix is optimized for each individual image. This is compatible with the JPEG standard, which requires transmission of the quantization matrix. Author (revised)

EXTRACTING HEADING AND TEMPORAL RANGE FROM OPTIC FLOW: HUMAN PERFORMANCE ISSUES

Mary K. Kaiser, John A. Perrone, Leland Stone, Martin S. Banks (California Univ., Berkeley.), and James A. Crowell (California Univ., Berkeley.) *In its* Proceedings of the Workshop on Augmented Visual Display (AVID) Research Dec. 1993 p 379-396 (For primary document see N94-25490 06-54)

Avail: CASI HC A03/MF A04

Pilots are able to extract information about their vehicle motion and environmental structure from dynamic transformations in the out-the-window scene. In this presentation, we focus on the information in the optic flow which specifies vehicle heading and distance to objects in the environment, scaled to a temporal metric. In particular, we are concerned with modeling how the human operators extract the necessary information, and what factors impact their ability to utilize the critical information. In general, the psychophysical data suggest that the human visual system is fairly robust to degradations in the visual display, e.g., reduced contrast and resolution or restricted field of view. However, extraneous motion flow, i.e., introduced by sensor rotation, greatly compromises human performance. The implications of these models and data for enhanced/synthetic vision systems are discussed. Author (revised)

OPTICAL INFORMATION IN LANDING SCENES

Walter W. Johnson *In its* Proceedings of the Workshop on Augmented Visual Display (AVID) Research Dec. 1993 p 397-406 (For primary document see N94-25490 06-54)

Avail: CASI HC A02/MF A04

During landing, the visual scene contains optical information about speed, altitude, glide slope, and track that is useful for the maintenance of spatial orientation and awareness. This information, embedded in the structure and transformations of the optical patterns, may be globally, regionally, or locally available. Global changes occur everywhere in the visual field during landing and include such information as flow rate acceleration due to changing speed and/or altitude. Regional changes occur within a more restricted area and include such information as horizon line motion due to aircraft pitching and rolling. Locally available changes are the most restricted and include such information as changes in runway form ratios due to changing glide slopes. Thus, within partially or fully synthetic displays, or within sensor-driven displays, preservation of flow rate and horizon motion information requires a minimum of knowledge about the details of the airport layout, while runway outlines do require much more knowledge of the layout. All may be important, however, and these, as well as other sources of optical information, can provide a pilot with his most natural framework for maintaining orientation.

SENSOR FUSION DISPLAY EVALUATION USING INFORMATION INTEGRATION MODELS IN ENHANCED/SYNTHETIC VISION APPLICATIONS

David C. Foyle *In its* Proceedings of the Workshop on Augmented Visual Display (AVID) Research Dec. 1993 p 409-419 (For primary document see N94-25490 06-54)

Avail: CASI HC A03/MF A04

Based on existing integration models in the psychological literature, an evaluation framework is developed to assess sensor fusion displays as might be implemented in an enhanced/synthetic vision system. The proposed evaluation framework for evaluating the operator's ability to use such systems is a normative approach: The pilot's performance with the sensor fusion image is compared to models' predictions based on the pilot's performance when viewing the original component sensor images prior to fusion. This allows for the determination as to when a sensor fusion system leads to: poorer performance than one of the original sensor displays, clearly an undesirable system in which the fused sensor system causes some distortion or interference; better performance than with either single sensor system alone, but at a sub-optimal level compared to model predictions; optimal performance compared to model predictions; or, super-optimal performance, which may occur if the operator were able to use some highly diagnostic 'emergent features' in the sensor fusion display, which were unavailable in the original sensor displays.

QUALITY METRICS FOR SENSOR IMAGES

Al Ahumada *In its* Proceedings of the Workshop on Augmented Visual Display (AVID) Research Dec. 1993 p 421-422 (For primary document see N94-25490 06-54)

Avail: CASI HC A01/MF A04

Methods are needed for evaluating the quality of augmented visual displays (AVID). Computational quality metrics will help summarize, interpolate, and extrapolate the results of human performance tests with displays. The FLM Vision group at NASA Ames has been developing computational models of visual processing and using them to develop computational metrics for similar problems. For example, display modeling systems use metrics for comparing proposed displays, halftoning optimizing methods use metrics to evaluate the difference between the halftone and the original, and image compression methods minimize the predicted visibility of compression artifacts. The visual discrimination models take as input two arbitrary images A and B and compute an estimate of the probability that a human observer will report that A is different from B. If A is an image that one desires to display and B is the actual displayed image, such an estimate can be regarded as an image quality metric reflecting how well B approximates A. There are additional complexities associated with the problem of evaluating the quality of radar and IR enhanced displays for AVID tasks. One important problem is the question of whether intruding obstacles are detectable in such displays. Although the discrimination model can handle detection situations by making B the original image A plus the intrusion, this detection model makes the inappropriate assumption that the observer knows where the intrusion will be. Effects of signal uncertainty need to be added to our models. A pilot needs to make decisions rapidly. The models need to predict not just the probability of a correct decision, but the probability of a correct decision by the time the decision needs to be made. That is, the models need to predict latency as well as accuracy. Luce and Green have generated models for auditory detection latencies. Similar models are needed for visual detection. Most image quality models are designed for static imagery. Watson has been developing a general spatial-temporal vision model to optimize video compression techniques. These models need to be adapted and calibrated for AVID applications.

EVALUATION OF IMAGE QUALITY

M. Pavel (Western Aerospace Labs., Inc., Moffett Field, CA.) *In its* Proceedings of the Workshop on Augmented Visual Display (AVID) Research Dec. 1993 p 423-431 (For primary document see N94-25490 06-54)

Avail: CASI HC A02/MF A04

This presentation outlines in viewgraph format a general approach to the evaluation of display system quality for aviation applications. This approach is based on the assumption that it is possible to develop a model of the display which captures most of the significant properties of the display. The display characteristics should include spatial and temporal resolution, intensity quantizing effects, spatial sampling, delays, etc. The model must be sufficiently well specified to permit generation of stimuli that simulate the output of the display system. The first step in the evaluation of display quality is an analysis of the tasks to be performed using the display. Thus, for example, if a display is used by a pilot during a final approach, the aesthetic aspects of the display may be less relevant than its dynamic characteristics. The opposite task requirements may apply to imaging systems used for displaying navigation charts. Thus, display quality is defined with regard to one or more tasks. Given a set of relevant tasks, there are many ways to approach display evaluation. The range of evaluation approaches includes visual inspection, rapid evaluation, part-task simulation, and full mission simulation. The work described is focused on two complementary approaches to rapid evaluation. The first approach is based on a model of the human visual system. A model of the human visual system is used to predict the performance of the selected tasks. The model-based evaluation approach permits very rapid and inexpensive evaluation of various design decisions. The second rapid evaluation approach employs specifically designed critical tests that embody many important characteristics of actual tasks. These are used in situations where a validated model is not available. These rapid evaluation tests are being implemented in a workstation environment.

Parallel computing is used to overcome problems in computer systems performance evaluation. Performance evaluation is an important step in the conception and development of computer systems. These systems are complex and their models are too large. To solve these models on a computer, two problems are found: memory and speed requirements. In the area of parallel computing, the communication cost on a distributed memory machine and the aspect of parallel computing related to data mapping, is studied. This aspect is assumed to perform a parallel vector matrix product which is the basic component of numerical iterative methods for solving models. Some iterative schemes to solve Markovian models are proposed. A parallelization of a Stochastic Automata Networks (SAN) solver which is specific to SAN modeling is developed. This parallelization leads to solved task allocation and reduced communication cost. The result of this parallelization is the ability to treat large models, many millions of states, in a reasonable time. ESA

DESIGN OF INTEGRATED ARCHITECTURES FOR LOW LEVEL IMAGE PROCESSING Ph.D. Thesis [CONCEPTION D'ARCHITECTURES INTEGREES DE TRAITEMENT D'IMAGE DE BAS NIVEAU]

Ahmed Boubekeur 1992 177 p In FRENCH

(ETN-94-95183) Avail: CASI HC A09/MF A02

Methods and tools for the design of massively parallel low level image processing integrated systems are presented. The design of a programmable two dimensional array of 6720 single bit Processors (PE's) implemented on a wafer is addressed. Two level defect tolerance techniques were used. At a subsystem level, a spare column is provided to replace defective PE's. At the wafer level, an original switching network (externally controlled) is used to bypass defective subarrays. A high level synthesis tool is used to synthesize automatically from a behavioral specifications a dedicated array from a specific application. Resources in terms of registers, connections (multiplexers), and memory points are minimized. ESA

(LAAS-93088; ETN-94-95185) Avail: CASI HC A09

A method for specifying architectures for heterogeneous internetworking is presented. This method was integrated in a system based on artificial intelligence techniques. The method is defined at a high level of abstraction. It evaluates the degree of incompatibility between interconnected networks, described as multilayer architectures, and determines a level of the architecture, called the incompatibility frontier, from which techniques to control the incompatibilities can be applied. The evaluation of incompatibilities is founded on the comparison of the network's addresses and of their service-protocol pairs; for communicating, distant entities must be able to identify themselves and exchange messages with a same service quality. Based on reliability criteria, the resulting internetworking architecture is specified. The specification relies on two types of interconnecting techniques: conversion and encapsulation. To integrate the method in a knowledge based system, the different types of domain concepts are modeled: a model, defined for the representation of addresses in a multilayer architecture, is formalized. An implemented prototype combines two knowledge representation formalisms: an object oriented formalism that structures complex knowledge, and a logic based formalism that implements inferences on the structure of knowledge. This system is interactive, providing a pedagogical tool for a user to conceptually study cases of internetworking: long haul networks with a connection oriented or a connectionless network layer and local area networks without a network layer. TOOLS REFERENCE MANUAL FOR A REQUIREMENTS SPECIFICATION LANGUAGE (RSL), VERSION 2.0

Gene L. Fisher and Gerald C. Cohen (Boeing Defense and Space Group, Seattle, WA.) Nov. 1993 69 p

(Contract NAS1-18586; RTOP 505-64-10-07)

(NASA-CR-191461; NAS 1.26:191461) Avail: CASI HC A04/MF A01

This report describes a general-purpose Requirements Specification Language, RSL. The purpose of RSL is to specify precisely the external structure of a mechanized system and to define requirements that the system must meet. A system can be comprised of a mixture of hardware, software, and human processing elements. RSL is a hybrid of features found in several popular requirements specification languages, such as SADT (Structured Analysis and Design Technique), PSL (Problem Statement Language), and RMF (Requirements Modeling Framework). While languages such as these have useful features for structuring a specification, they generally lack formality. To overcome the deficiencies of informal requirements languages, RSL has constructs for formal mathematical specification. These constructs are similar to those found in formal specification languages such as EHDM (Enhanced Hierarchical Development Methodology), Larch, and OBJ3. Author (revised)

CONTRIBUTION TO THE EVALUATION OF EFFICIENCY OF A MICROPROCESSOR FUNCTIONAL TEST Ph.D. Thesis [CONTRIBUTION A L'EVALUATION DE L'EFFICACITE DU TEST FONCTIONNEL DE MICROPROCESSEURS]

Bernard Martinet 1992 186 p In FRENCH

(ETN-94-95176) Avail: CASI HC A09/MF A02

A method for studying the efficiency of a microprocessor functional test is presented. The efficacity of a test consists in its capability of distinguishing perfect circuits from defective ones. The purpose of the functional test is to assist validation design and diagnosis of complex circuits. The method comprises the introduction of defects, by a laser device, into perfect circuits. Several experiments were performed on 8 bits and 16 bits commercially available microprocessors. The efficacity of the proposed test method and that of the manufacturer's structural test are compared. The principles of the parametric test, the dynamic test and the logical test, are summarized. The most common physical defects occurring in integrated circuits are reviewed. ESA

A METHOD FOR THE GENERAL SIMULTANEOUS FULL DECOMPOSITION OF SEQUENTIAL MACHINES: ALGORITHMS AND IMPLEMENTATION Thesis

Lech Jozwiak and Albert P. H. vanDijk Dec. 1992 107 p

(EUT-92-E-267; ISBN-9-06-144267-2; ETN-94-94774) Avail: CASI HC A06/MF A02

Research to develop, implement and test an efficient heuristic method for the general simultaneous full decomposition of Moore machines with encoded inputs and outputs and symbolic states is reported. The method was required to be able to discover the natural decompositional structure of the sequential machine. The method constructs the limited set of near optimal decompositions using a beam search bottom up hierarchical clustering algorithm, with decision making based on correlations between the information flows in the sequential machine. In order to get an impression about the performance of the method, a number of experiments were performed. In these experiments some machines were used with a known optimal decompositional structure and other machines were taken from the international benchmark set. The preliminary results are promising: in all the checked cases, the method was able to discover the natural decompositional structure by a very limited search; however, checking the method on larger samples of machines is still necessary in order to obtain more complete and more reliable information on the performance of the method. SOME BACKGROUND INFORMATION ON PERCEPTUAL COLOR MATCHING PERTINENT TO COMPUTER APPLICATIONS Final Report

G. B. Beretta 1993 48 p See also PB89-195309 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(PB93-200327; CIS-N-93-742) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

In closed color reproduction systems, color can be controlled with densitometric methods. With the advent of distributed document management systems-which entail device independence-these methods fail, and the use of colorimetry is necessary. However, even with colorimetry, a number of problems remain hard to solve, especially across media. It is often believed that such problems can be solved using more general models, like those developed in the study of color appearance. The report is an attempt to provide some background information about the modeling of color appearance. To guide the exposition, the author asks the question: 'Why are computer users willing to spend hundreds of dollars more for their equipment to add color.' After defining color appearance, he presents some published models from the literature. Finally, he relates it to colorimetry and reviews the possible benefits for desktop document preparation.

REAL-TIME PROCESS LOGIC
J. C. M. Baeten, J. A. Bergstra (Amsterdam Univ., Netherlands.), and R. N. Bol 1993 42 p Prepared in cooperation with Utrecht State Univ. (Netherlands), and Amsterdam Univ. (Netherlands) Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-101441; COMPUTING SCIENCE NOTES-93/15) Copyright Avail: CASI HC A03

Systems can be described at various levels of abstraction: automata, processes and behavior. The authors take the ready trace set as a description of the behavior of a process, and they present a ready trace model of symbolic (untimed) and real time process algebra. They argue that, especially in the real time case, properties of ready trace sets are best formulated in a dedicated logic. They present the syntax and semantics of a logic that could serve this purpose, and they apply it on two examples: expressing the correctness of a concurrent alternating bit protocol, and demonstrating the (well-known) non-existence of so-called coordinated attack protocols. A connection is made with the metric temporal logic of Koymans. NTIS

Toshio Shimada 26 Mar. 1993 116 p In JAPANESE
(Rept-946; JTN-94-80515) Avail: CASI HC A06/MF A02

A study was conducted to solve problems for building a practical data flow computer, to build it, and to verify that its performance is comparable with von Neuman computers. The following subjects are outlined: (1) description of a data flow computation model and discussion on the necessary features of data flow programming languages; (2) an execution model which incorporates a concept of finite resources into a data flow computation model; (3) the architecture of the data flow computer SIGMA-1, including the system configuration, addressing of the definitions of instructions and packets, data representation, the processing element, the structure element, and the network; (4) the design of the data flow programming language DFC (Data-Flow C); (5) various optimization techniques, including a clean graph generation method, an efficient execution mechanism of a loop structure, and a concurrency control mechanism; and (6) evaluation of the SIGMA-1 performance. The results of the study verified the feasibility of a data flow computer by showing that an effective performance of the data flow computer SIGMA-1 is 118 Million Floating Point Operations Per Second (MFLOPS). HIGH SPEED ELECTRONIC ANALOG COMPUTERS USING LOW-GAIN AMPLIFIERS Patent
Arthur D. Delagrange, inventor (to Navy) 17 Aug. 1993 10 p Filed 29 Aug. 1991
(AD-D015974; US-Patent-5,237,526; US-Patent-Appl-SN-751479; US-Patent-Class-364-807) Avail: US Patent and Trademark Office

The operational amplifiers conventionally used in electronic analog computers can be replaced with fixed gain differential amplifiers having no external negative feedback to control their gain. This allows a large increase in the bandwidth of the computers, with a resulting faster response time. Circuits for summing, integration, and differentiations are specifically disclosed using fixed-gain amplifiers. DTIC

SPECIAL SIGNATURE SCHEMES Ph.D. Thesis
Eugene Josephus L. J vanHeijst 1992 137 p
(ETN-94-95296) Avail: CASI HC A07/MF A02

Different aspects of digital signatures are discussed. An overview of the public key cryptography, the message confidentiality and authentication, the cryptosystems based on discrete logarithm and RSA (Rivest-Shamir-Adleman), blobs, and zero knowledge is given. Theoretical results for the security oflarge classes of RSA based signatures are presented. Three new kinds of signature schemes and constructions for them are given: group signatures, undeniable signatures unconditionally secure for the signer, and convertible signatures unconditionally secure for the signer. An efficient construction for fail-stop signatures is included. Two applications of signature methods, a payment system and a new kind of blob, are discussed. ESA

TRANSPUTER BENCHMARKS AND PERFORMANCE COMPARISONS WITH OTHER COMPUTING MACHINES
Ian J. Cornish and Ali M. S. Zalzala Feb. 1993 7 p
(RR-467; ETN-94-95134) Avail: CASI HC A02/MF A01

A performance index for several hardware/software combinations, to ease the decision making process, is presented. The aim is to provide a tool to enable engineering researchers to assess their needs and choices before starting a job. The actual implementation of a computer based control application can be expensive and time consuming. The performance of a single transputer, and of a network of transputers, is compared with that of a variety of Von Neumann type processors. The effect of the choice of language on a system performance is assessed. ESA

(RR-468; ETN-94-95135) Avail: CASI HC A02/MF A01

An efficient motion planner for a two robot system operating in a unified environment is implemented. The distributed formulation of the planner is mapped on a network of T800 transputers and caters to the needs of minimum time and collision free robot motion in real time. Practical implementation of the planner for two coordinated RTX robots is reported. Performance results of an execution run are given. The total system hardware comprises a network of 10 transputers hosted by a UNIX based workstation, where in addition to the planning algorithm reported, 4 transputers are used to interface the robots. The planning and interface networks are activated simultaneously by downloading the appropriate booting codes. The system is seen as a development tool for further phases of advanced robotics research. ESA

In 1984, Inmos introduced the transputer. The transputer is a microprocessor that is designed to operate in parallel with other transputers in the same system. Most aspects of the transputer were designed with this fact in mind. As a result, inter-processor and inter-process communication is a very important part of the design of the transputer. These parallel processing communications abilities can be very valuable to the Army in the area of chemical detection and its subsequent signal processing needs. DTIC

ON DYNAMIC INPUT-OUTPUT LINEARIZATION OF DISCRETE-TIME NONLINEAR SYSTEMS
U. Kotta and H. Nijmeijer (Academy of Sciences of the Estonian SSR, Tallinn.) Mar. 1993 41 p Sponsored in part by Dutch Network in Systems and Control
(MEMO-1123; ETN-94-94759) Avail: CASI HC A03/MF A01

The problem of linearizing the input output map of an analytic discrete time nonlinear system locally around a given trajectory is studied. Necessary and sufficient conditions are given for the existence of a regular dynamic state feedback control law under which the input dependent part of the response of a nonlinear system becomes linear in the input and independent of the initial state. The proposed conditions are less restrictive than those obtained by Lee and Marcus for linearizing the input output map via a static state feedback. Instrumental in the problem solution is the inversion (structure) algorithm for discrete time nonlinear system. The solvability conditions are expressed in terms of the inversion algorithm. The proof of the existence and construction of the dynamic state feedback compensator relies on this algorithm. ESA

DEFINITION AND REALIZATION OF A FORMAL VERIFICATION TOOL OF LUSTRE PROGRAMS: THE LESAR SYSTEM Ph.D. Thesis [DEFINITION ET REALISATION D'UN OUTIL DE VERIFICATION FORMELLE DE PROGRAMMES LUSTRE: LE SYSTEME LESAR]
Christophe Ratel 1992 189 p In FRENCH
(ETN-94-95164) Avail: CASI HC A09/MF A02

The formal verification methods of LUSTRE programs is defined and implemented. LUSTRE is a programming language dedicated to the design of reactive systems. The verification of a system consists of ensuring that all its behaviors are correct when compared to specifications. The behaviors of a LUSTRE program can be represented by a finite state machine. The standard approach implementing the method is bounded by the explosion problem of the generated machine. A new approach avoiding this problem is presented. Two original implementations of a standard and a new approach using a symbolic technique are presented. Diagnosis aspects corresponding to the case of programs that do not agree with their specifications are considered. ESA

Bachir Berkane 1992 157 p In FRENCH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-94-95181) Avail: CASI HC A08

The functional verification of hardware design consists of checking that a given system operates as specified. Two kinds of high level specifications are used in hardware design: a complete specification given by a high abstraction level; and a partial high level specification made up of a set of properties that the system must satisfy. These two different kinds of hardware specifications give rise to two different verification problems. A unified framework to handle the two verification problems on synchronous sequential digital hardware systems is presented. Each verification problem comes down to defining a verification machine with a single output flag and to verifying that that flag is always true. The application of the langage LUSTRE and the verification tool LESAR are studied. Verification problems can be handled by defining a LUSTRE program with a single output flow. The verification is automatically performed by the verification tool LESAR. ESA

(LAAS-93179; ETN-94-95193) Avail: CASI HC A07/MF A02

Causal labeled transition systems are proposed. This consists of a model of concurrent systems which has the same degree of simplicity as conventional labeled transition systems but permits concurrency among events to be expressed by causal independency. A concurrent system's behavior is modeled by a transition system, and the causality among events is expressed by a transition labeling mechanism similar to the variable abstraction of Lambda-notation. This approach describes the behavior of concurrent systems. Many concepts and results developed for conventional labeled transition systems are extended to causal labeled transition systems. The concept of bisimilarity is characterized in terms of causal labeled transition systems. A causality based operational semantics of the Calculus of Communicating Systems (CCS), based on causal labeled transition systems, is presented. ESA

(DE94-000309; UCRL-JC-114363; CONF-9308172-1) Avail: Issuing Activity (Department of Energy (DOE))

The theory for an elliptic mesh generator is developed for use in the advection step of a 3D ALE algorithm. This mesh generator is derived by a variational principle for an unstructured 3D grid using finite elements. An arbitrary weight function is introduced which is based on the geometric properties of the existing mesh. These geometric weights should allow for a smooth grid that retains the general shape of the original mesh. DOE

We describe new types of numerical integration algorithms developed by the authors. The main aim of the algorithms is to numerically integrate differential equations which evolve on geometric objects, such as the rotation group. The algorithms provide iterates which lie on the prescribed geometric object, either exactly, or to some prescribed accuracy, independent of the order of the algorithm. This paper describes applications of these algorithms to the evolution of the attitude of a rigid body. Author

This note is concerned with the explicit symbolic computation of expressions involving differential operators and their actions on functions. The derivation of specialized numerical algorithms, the explicit symbolic computation of integrals of motion, and the explicit computation of normal forms for nonlinear systems all require such computations. More precisely, if R = k(x(sub 1),...,x(sub N)), where k = R or C, F denotes a differential operator with coefficients from R, and g member of R, we describe data structures and algorithms for efficiently computing g. The basic idea is to impose a multiplicative structure on the vector space with basis the set of finite rooted trees and whose nodes are labeled with the coefficients of the differential operators. Cancellations of two trees with r + 1 nodes translates into cancellation of O(N(exp r)) expressions involving the coefficient functions and their derivatives. Author (revised)

A DATAFLOW ANALYSIS TOOL FOR PARALLEL PROCESSING OF ALGORITHMS

Robert L. Jones, III Nov. 1993 21 p
(RTOP 233-01-03)
(NASA-TM-109054; NAS 1.15:109054) Avail: CASI HC A03/MF A01

A graph-theoretic design process and software tool is presented for selecting a multiprocessing scheduling solution for a class of computational problems. The problems of interest are those that can be described using a dataflow graph and are intended to be executed repetitively on a set of identical parallel processors. Typical applications include signal processing and control law problems. Graph analysis techniques are introduced and shown to effectively determine performance bounds, scheduling constraints, and resource requirements. The software tool is shown to facilitate the application of the design process to a given problem. Author

DYNAMIC DATA DISTRIBUTIONS IN VIENNA FORTRAN Final Report

Barbara Chapman (Wien Univ., Austria.), Piyush Mehrotra, Hans Moritsch (Wien Univ., Austria.), and Hans Zima (Wien Univ., Austria.) Dec. 1993 21 p Submitted for publication
(Contract NAS1-19480; RTOP 505-90-52-01)
(NASA-CR-191575; NAS 1.26:191575; ICASE-93-92) Avail: CASI HC A03/MF A01

Vienna Fortran is a machine-independent language extension of Fortran, which is based upon the Single-Program-Multiple-Data (SPMD) paradigm and allows the user to write programs for distributed-memory systems using global addresses. The language features focus mainly on the issue of distributing data across virtual processor structures. Those features of Vienna Fortran that allow the data distributions of arrays to change dynamically, depending on runtime conditions are discussed. The relevant language features are discussed, their implementation is outlined, and how they may be used in applications is described. Author (revised)

ASYNCHRONOUS RENDEZVOUS IN DISTRIBUTED LOGIC PROGRAMMING

A. Elieens and E. P. deVink Sep. 1992 33 p See also PB92-108646 and AD-A171 902
(PB93-220614; IR-304) Avail: CASI HC A03/MF A01

The semantics of the communication mechanism of the distributed logic programming language DLP is studied. DLP combines logic programming with object oriented features and parallelism. For an abstract subset of DLP, both an operational and denotational semantics is given. The language DLP supports active objects, method call by rendezvous and moreover distributed backtracking over the results of such a rendezvous. To enable further exploitation of parallelism, the rendezvous provided is asynchronous. A distinction is made between the creation of a process for evaluating the method call on the one hand, and the request for an answer on the other hand. To model this communication mechanism, syntactic resumptions are employed. The notion of a resumption explains the backtracking taking place in the asynchronous rendezvous. In addition, resumptions facilitate the systematic comparison of the operational and denotational semantics presented. NTIS

LINEAR ALGORITHM FOR FLATTENING LIST GRAPHS

P. Boncz Sep. 1992 33 p Limited Reproducibility: More than 20% of

this document may be affected by microfiche quality
(PB93-220648; IR-300) Avail: Issuing Activity (National Technical Information Service (NTIS))

List Graphs are directed graphs in which the vertices correspond to the elements of a number of N lists. The edges of the graph are formed by the links between the elements in the N lists. When trying to flatten a List Graph, the occurrence of cycles rules out an optimal solution, in which all N original lists are sublist of the combined list. The linear flattening algorithm described in this paper produces a sorted list in which the number of elements that contradict the order of an original list is minimized. Also, the mu lists with the highest priority are sublist of it (1 = or less than mu = or less than N). It can be proven that a solution with more than the mu highest lists being sublist does not exist. NTIS

HYPERMEDIA SUPPORT FOR ENGINEERING DESIGN SYSTEM
J. Saeaeski Mar. 1993 29 p See also PB93-165587 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-226256; ISBN-951-22-1500-4) Avail: CASI HC A03

The report is a literature study about the possibilities of using hypermedia for supporting engineering design systems. Hypermedia is an electronic document in which information is stored in a network of nodes connected by links. Nodes can contain text, graphics, photos, music, speech, animation and video. References between nodes are possible through links. Links need not to be in sequential order so nodes can be accessed in a non-linear fashion. Hypermedia's underlying notion of linking nodes of information and its capability to handle these information entities stored in various forms appear to be well suited for engineering design support systems. (ETN-94-95174) Avail: CASI HC A09

The logic synthesis problems on two types of programmable devices, the programmable gate array and the programmable array logic, are studied. The programmable gate array is organized as a network of elementary cells, in which each elementary cell can implement any boolean function or couple of boolean functions of k variables. In the programmable array logic, the basic block implements k boolean functions expressed as a sum of k prime product terms of k double prime variables. In both cases the lexicographical factorization method is proposed. It consists of writing in an optimized way a set of boolean functions while respecting an input order, called the lexicographical order, in the parenthesis of the expression. A decomposition into subfunctions mappable on the basic blocks relies on this lexicographical order, and looks for subfunctions depending on successive subsequences or slices of the input sequence. Two types of decompositions are proposed, one oriented towards area optimization and one oriented towards speed optimization. Practical results on a set of international benchmarks are shown. ESA

A TYPE DECLARATIVE SYSTEM FOR PROLOG Ph.D. Thesis [UN SYSTEME DECLARATIF DE TYPES POUR PROLOG]
Lan NguyenPhuong 1992 124 p In FRENCH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-94-95178) Avail: CASI HC A06

A polymorphic type declarative system for PROLOG language is developed. The principles of a type system for PROLOG and examples of solutions are given. Several typing approaches and real system examples are studied. The role of the mode concept for the language and for type systems is justified. Concerning the user, the following topics are discussed: type languages, predicate statements, and main order relationship between types. The theorem which states type corrections for characteristic typed programs is proven. The inner statements, the algorithms, and the techniques applied to implement a prototype on the system are presented. A type language allowing the parametric polymorphic concept and the type inclusion relationship to be described is developed. The sufficient condition for a satisfactory typing result is presented and validated. ESA

USING GENETIC ALGORITHMS FOR SCHEDULING DATA FLOW GRAPHS
L. J. M. Cluitmans Dec. 1992 85 p
(EUT-92-E-266; ISBN-9-06-144266-4; ETN-94-94773) Avail: CASI HC A05/MF A01

A scheduling problem in High Level Synthesis, a section in a silicon compiler for the automatic design of integrated circuits, is addressed. In the High Level Synthesis section, the functional specification is transformed into a description for a network of modules (like adders or multipliers) and a controller for that network. A scheduler that uses a 'genetic algorithm' to perform the optimization is described. Internally it uses a (resource constrained) 'list scheduler' in the process of representing schedules. The genetic scheduler is fast and produces good results. Several features that would be nice for a scheduler (chaining, pipelining, taking into account register costs, etc.) are not yet implemented. The genetic part of the scheduler could not be tested very well because for many problems the initialization of the algorithm already gave the optimal solution. Larger benchmarks are necessary to test the genetic part more thoroughly. ESA

PROGRIL: A LANGUAGE FOR THE DEFINITION OF PROTOCOL GRAMMARS
R. H. J. Bloks Mar. 1993 42 p
(EUT-93-E-270; ISBN-9-06-144270-2; ETN-94-94777) Avail: CASI HC A03/MF A01

One of the results of the protocol engine research project, which is targeted towards the automatic generation of hardware implementations for modern complex data communication protocols, is reported. The word 'automatic' implies the use of computers to accomplish the task which in turn requires a formal language that can be used to describe these protocols. Such a language and a compiler for it have now been created. The language is based on an extension of context free grammars and is called PROGRIL (Protocol Grammar Interface Language). The syntax and semantics of the protocol grammar interface language are informally described. In addition to defining a protocol grammar, PROGRIL contains some constructs that are necessary to link multiple grammars together in order to obtain a larger cooperating system. All sections of a PROGRIL description are explained, the exact syntax is given and for all possible constructs a textual explanation is given with some examples to clarify its use. Operator priorities and tables with all keywords with their use and meaning are given and the concept of time is introduced. Since there may be no ambiguities or inconsistencies in the protocol description language, its syntax must follow some strict rules, defined in a meta grammar. In principle, this meta description defines the exact syntax of the grammar, but it is not easily readable. The syntax is therefore explained in an easier to read and understand form. Context conditions are explained separately where necessary. The protocol grammar is used as a formal language to describe complex protocols in such a way, that they can be directly implemented in hardware, but also that formal verification methods are still applicable and interfacing to other high level languages remains possible. ESA

CODE GENERATION FOR THE ATTRIBUTE EVALUATOR OF THE PROTOCOL ENGINE GRAMMAR PROCESSOR UNIT
R. H. J. Bloks Mar. 1993 40 p
(EUT-93-E-271; ISBN-9-06-144271-0; ETN-94-94778) Avail: CASI HC A03/MF A01

One of the results of the protocol engine research project, which is targeted towards the automatic generation of hardware implementations for modern complex data communication protocols, is reported. The word 'automatic' implies the use of computers to accomplish the task which in turn requires a formal language that can be used to describe these protocols. Such a language and a compiler for it have now been created. The language is based on an extension of context free grammars and is called PROGRIL (Protocol Grammar Interface Language). The process of code generation for the attribute expression evaluation is explained. A protocol grammar consists of a set of attributes or variables, a set of symbols, a set of production rules and attribute relations between the attributes of symbols appearing in the rules. Whenever a certain symbol is parsed, the expressions for its attributes must be evaluated. These protocol grammars can be implemented on protocol pushdown automata, which are extensions of the standard pushdown automaton. One of the extensions to this basic automaton is the attribute evaluator, which is in fact a custom designed processor capable of performing all operations required for the manipulation of attributes of the protocol grammar. All expressions given in the grammar are assignment expressions, using constants, declared attributes, and system variables or functions. These expressions must be translated directly into machine language code for the attribute evaluator by the PROGRIL compiler. This code will be referred to as explicit code. In contrast to the explicit code, there is also implicit code, which is necessary for correct operation of the system, but is not directly 'programmed' by the writer of the grammar. Instead, this code is implicitly defined by and extracted from the grammar. It is used to do attribute memory management, passing attribute values, and other system functions. ESA

Simulation is most widely used for the verification of Very Large Scale Integration (VLSI) circuits design. The importance of mixed mode digital analog simulation is highlighted and its basic principles are described. Several mixed mode simulators are presented. Hardware description languages that cover both the digital and the electric levels are considered. The generalities are presented together with the current standardization effort for analog Very Hardware Description Language (VHDL). The main requirements are analyzed, and examples are given to compare alternative solutions. ESA

PROGRAMMING IN FORTRAN M
I. Foster, R. Olson, and S. Tuecke Aug. 1993 53 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contract W-31-109-eng-38)
(DE94-000541; ANL-93/26) Avail: Issuing Activity (Department of Energy (DOE))

Fortran M is a small set of extensions to Fortran that supports a modular approach to the construction of sequential and parallel programs. Fortran M programs use channels to plug together processes which may be written in Fortran M or Fortran 77. Processes communicate by sending and receiving messages on channels. Channels and processes can be created dynamically, but programs remain deterministic unless specialized nondeterministic constructs are used. Fortran M programs can execute on a range of sequential, parallel, and networked computers. This report incorporates both a tutorial introduction to Fortran M and a users guide for the Fortran M compiler developed at Argonne National Laboratory. The Fortran M compiler, supporting software, and documentation are made available free of charge by Argonne National Laboratory, but are protected by a copyright which places certain restrictions on how they may be redistributed. See the software for details. The latest version of both the compiler and this manual can be obtained by anonymous ftp from Argonne National Laboratory in the directory pub/fortran-m at info.mcs.anl.gov. DOE

APLAC: AN OBJECT-ORIENTED ANALOG CIRCUIT SIMULATOR AND DESIGN TOOL. 6.1 SYSTEM SIMULATIONS MANUAL
S. Rosnell and J. Liukkonen 1992 456 p See also PB93-187193 and PB93-187201 Prepared in cooperation with Nokia Research Center, Espoo, Finland
(PB93-224871; ISBN-951-22-1601-9) Copyright Avail: CASI HC A20/MF A04

The system simulations manual for the Analysis Program for Linear Active Circuits (APLAC), version 6.1 is presented. The main goal of APLAC is to give the user full freedom in solving his/her problems without the restrictions of conventional simulators. The sixth generation of APLAC was created having improved convergence algorithms for DC, transient, and harmonic analyses and improved menu-driven actions. In addition, convolution technique was implemented enabling the use of frequency-dependent components in the transient analysis of nonlinear circuits. NTIS

GUIDE TO SOFTWARE CONFIGURATION MANAGEMENT
Nov. 1992 72 p
(ESA-PSS-05-09-Issue-1; ETN-94-95196) Copyright Avail: CASI HC A04/MF A01

The software engineering standards to be applied for all deliverable software implemented for the European Space Agency (ESA), either in house or by industry, are described. ESA Procedures, Specifications, Standards PSS-05-0 requires that the configuration of the code and documentation be managed throughout the software development life cycle. This activity is called Software Configuration Management (SCM). Each project must define its SCM activities in a SCM Plan (SCMP). Software configuration management is explained, guidelines on how to do it are provided, and the contents of a SCMP are detailed. This guide should be read by everyone concerned with developing, installing, and changing software, that is software project managers, software librarians, and software engineers. Some sections describing procedures for handling software problems and changing documents are of interest to users. ESA

PATH PLANNING BY QUERYING PERSISTENT STORES OF TRAJECTORY SEGMENTS Abstract Only
Robert L. Grossman, S. Mehta, and Xiao Qin Sep. 1993 1 p Submitted for publication
(Grants NAG2-513; NSF DMS-91-01089)
(NASA-CR-194789; NAS 1.26:194789) Avail: CASI HC A01/MF A01

We introduce an algorithm for path planning (long duration) paths of dynamical systems, given a persistent object store containing suitable collections of short duration trajectory segments. We also describe experimental results from a proof-of-concept implementation of the algorithm. The basic idea is to interpret a path planning algorithm as a suitable query on a persistent object store consisting of short duration trajectory segments. The query returns a concatenation of short duration trajectory segments which is close to the desired path. The needed short duration segments are computed by using a divide and conquer algorithm to break up the original path into shorter paths; each shorter path is then matched to a nearby trajectory segment which is part of the persistent object store by using a suitable index function. PHASED-MISSION SYSTEM ANALYSIS USING BOOLEAN ALGEBRAIC METHODS
Arun K. Somani (Washington Univ., Seattle.) and Kishor S. Trivedi (Duke Univ., Durham, NC.) Nov. 1993 21 p
(Contract NAS1-19480; RTOP 505-90-52-01)
(NASA-CR-191564; ICASE-93-84; NAS 1.26:191564) Avail: CASI HC A03/MF A01

Most reliability analysis techniques and tools assume that a system is used for a mission consisting of a single phase. However, multiple phases are natural in many missions. The failure rates of components, system configuration, and success criteria may vary from phase to phase. In addition, the duration of a phase may be deterministic or random. Recently, several researchers have addressed the problem of reliability analysis of such systems using a variety of methods. A new technique for phased-mission system reliability analysis based on Boolean algebraic methods is described. Our technique is computationally efficient and is applicable to a large class of systems for which the failure criterion in each phase can be expressed as a fault tree (or an equivalent representation). Our technique avoids state space explosion that commonly plague Markov chain-based analysis. A phase algebra to account for the effects of variable configurations and success criteria from phase to phase was developed. Our technique yields exact (as opposed to approximate) results. The use of our technique was demonstrated by means of an example and present numerical results to show the effects of mission phases on the system reliability. Author (revised)

AUTOMATED PARALLELIZATION OF TIMED PETRI-NET SIMULATIONS Final Report
David M. Nicol (College of William and Mary, Williamsburg, VA.) and Weizhen Mao (College of William and Mary, Williamsburg, VA.) Dec. 1993 30 p Submitted for publication
(Contracts NAS1-19480; NAS1-18605; NAG1-060; NAG1-787; NAG1-1132; NSF ASC-88-19373; NSF CCR-92-01195; NSF CCR-92-10372; RTOP 505-90-52-01)
(NASA-CR-191574; NAS 1.26:191574; ICASE-93-91) Avail: CASI HC A03/MF A01

Timed Petri-nets are used to model numerous types of large complex systems, especially computer architectures and communication networks. While formal analysis of such models is sometimes possible, discrete-event simulation remains the most general technique available for assessing the model's behavior. However, simulation's computational requirements can be massive, especially on the large complex models that defeat analytic methods. One way of meeting these requirements is by executing the simulation on a parallel machine. Simple techniques for the automated parallelization of timed Petri-net simulations are described. Both the issue of processor synchronization, as well as the automated mapping, static and dynamic, of the Petri-net to the parallel architecture are addressed. As part of this effort, a new mapping algorithm, one that also applies to more general parallel computations, is described. Analytic properties of the solution produced by the algorithm, including optimality on some regular topologies, are established. The viability of our integrated approach is demonstrated empirically on the Intel iPSC/860 and Delta architectures using many processors. Excellent performance is observed on models of parallel architectures. Author (revised)

IMAGE PATTERN RECOGNITION SUPPORTING INTERACTIVE ANALYSIS AND GRAPHICAL VISUALIZATION Final Report
James M. Coggins Jan. 1992 31 p
(Contract NAS5-30428; RTOP 506-59-11)
(NASA-CR-194878; NAS 1.26:194878) Avail: CASI HC A03/MF A01

Image Pattern Recognition attempts to infer properties of the world from image data. Such capabilities are crucial for making measurements from satellite or telescope images related to Earth and space science problems. Such measurements can be the required product itself, or the measurements can be used as input to a computer graphics system for visualization purposes. At present, the field of image pattern recognition lacks a unified scientific structure for developing and evaluating image pattern recognition applications. The overall goal of this project is to begin developing such a structure. This report summarizes results of a 3-year research effort in image pattern recognition addressing the following three principal aims: (1) to create a software foundation for the research and identify image pattern recognition problems in Earth and space science; (2) to develop image measurement operations based on Artificial Visual Systems; and (3) to develop multiscale image descriptions for use in interactive image analysis. LINEAR TIME ALGORITHM TO SCHEDULE TREES WITH COMMUNICATION DELAYS OPTIMALLY ON TWO MACHINES
M. Veldhorst Mar. 1993 22 p
(PB93-237782; MEMO-COSOR-93-07) Avail: CASI HC A03/MF A01

For the implementation of a parallel program, considered as a collection of processes, on a parallel computer, one of the major problems is to determine which processor should execute which process and at what time; the purpose is that the moment of time that all processes have been executed (i.e., the execution of the parallel program has finished), occurs as early as possible. Besides the possibility that processes may have different execution lengths (possibly not exactly known in advance), processes might use (intermediate) results computed by other processes. Making these results available may require an additional (to the execution length) amount of time, the communication delay. During this communication, delay processors may execute processes that have already obtained all necessary data. The paper uses the general approach of list scheduling that yields feasible schedules, and proves that under certain conditions the algorithm runs in linear time. Then it concentrates on the creation of the list, such that the list-scheduling algorithm yields an optimal schedule and runs in linear time. NTIS

VISUALIZATION OF RESULTS FROM METEOROLOGICAL SIMULATIONS ON CRAY
S. Groenas and Ketil Aamnes Dec. 1992 34 p See also PB93-201366 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-201358; STF10-A92019) Avail: Issuing Activity (National Technical Information Service (NTIS))

The report considers the problem of graphical display of the results from Numerical Weather Prediction (NWP) simulations based on the model used by the Norwegian Meteorological Institute (DNMI). First a brief description of this Norwegian NWP model and its use in Norway is given. Then the presentation aspects are introduced, the activity concerning visualization of meteorological information. Animation of 3D presentations, an activity called 4D visualization, has been tried in NWP research using high-end workstations as platforms. A main objective of the report is to investigate the present status of available software and HW-platforms for 4D visualization, and see if 4D presentations now can be done on low-end workstations. Some available software for 4D visualization of model output has been tried on a case describing the New Years Day Storm 1992, one of the strongest storms hitting Norway in modern time. A video has been made containing animated sequences from two of these systems. NTIS

MITS ARCHITECTURE V1.0
O. J. Roedseth 8 Jan. 1993 34 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-201762; STF48-A93001) Avail: Issuing Activity (National Technical Information Service (NTIS))

The document gives a short overview of the Maritime Information Technology Standard (MITS) network. It looks at the programmer's model which is characterized by connection-oriented simple interface by point-to-point communication to a distributed database. The physical implementation is characterized by using established standards, as far as possible. The communication layers on top of TCP/IP are particular to MITS, but still open. It makes the application interface as simple as possible. Most complexity is hidden in application-independent and, hence, reusable modules. The MITS concept is useful for many different network architectures. NTIS

A KNOWLEDGE BASED SYSTEM FOR SCIENTIFIC DATA VISUALIZATION Final Report
Hikmet Senay and Eve Ignatius Jan. 1992 23 p Original contains color illustrations
(Contract NAS5-30428; RTOP 506-59-11)
(NASA-CR-194879; NAS 1.26:194879) Avail: CASI HC A03/MF A01; 4 functional color pages

A knowledge-based system, called visualization tool assistant (VISTA), which was developed to assist scientists in the design of scientific data visualization techniques, is described. The system derives its knowledge from several sources which provide information about data characteristics, visualization primitives, and effective visual perception. The design methodology employed by the system is based on a sequence of transformations which decomposes a data set into a set of data partitions, maps this set of partitions to visualization primitives, and combines these primitives into a composite visualization technique design. Although the primary function of the system is to generate an effective visualization technique design for a given data set by using principles of visual perception the system also allows users to interactively modify the design, and renders the resulting image using a variety of rendering algorithms. The current version of the system primarily supports visualization techniques having applicability in earth and space sciences, although it may easily be extended to include other techniques useful in other disciplines such as computational fluid dynamics, finite-element analysis and medical imaging. (NASA-TM-108795; A-94012; NAS 1.15:108795) Avail: CASI HC A04/MF A01

Whether a researcher is designing the 'next parallel programming paradigm,' another 'scalable multiprocessor' or investigating resource allocation algorithms for multiprocessors, a facility that enables parallel program execution to be captured and displayed is invaluable. Careful analysis of execution traces can help computer designers and software architects to uncover system behavior and to take advantage of specific application characteristics and hardware features. A software tool kit that facilitates performance evaluation of parallel applications on multiprocessors is described. The Automated Instrumentation and Monitoring System (AIMS) has four major software components: a source code instrumentor which automatically inserts active event recorders into the program's source code before compilation; a run time performance-monitoring library, which collects performance data; a trace file animation and analysis tool kit which reconstructs program execution from the trace file; and a trace post-processor which compensate for data collection overhead. Besides being used as prototype for developing new techniques for instrumenting, monitoring, and visualizing parallel program execution, AIMS is also being incorporated into the run-time environments of various hardware test beds to evaluate their impact on user productivity. Currently, AIMS instrumentors accept FORTRAN and C parallel programs written for Intel's NX operating system on the iPSC family of multi computers. A run-time performance-monitoring library for the iPSC/860 is included in this release. We plan to release monitors for other platforms (such as PVM and TMC's CM-5) in the near future. Performance data collected can be graphically displayed on workstations (e.g. Sun Sparc and SGI) supporting X-Windows (in particular, XI IR5, Motif 1.1.3). Author (revised)

SIMULTANEOUS SIMULATION AND VISUALIZATION USING DGL
Ketil Aamnes, Vegard Vesterheim, and Terje Roelvag 31 Dec. 1992 30 p See also PB93-201358 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-201341; STF10-A92018) Avail: Issuing Activity (National Technical Information Service (NTIS))

The main objective of the project was to develop knowledge about distributed graphics using the network transparent feature of the Graphics Library (GL) called the Distributed GL (DGL), which is part of the Cray Visual Tools (CVT). A program called GL view has been implemented on the CRAY utilizing DGL. The goal was to use this knowledge to develop a system for simultaneous simulation and visualization. It would allow the user to interrupt and communicate with the simulation as it proceeds. This gives the user a better understanding of the progress of a simulation. Part of the work has been concentrated on the development of a socket communication between a simulation program and the visualization program allowing these two processes to communicate even though they are executed on different machines. As a case to implement these ideas, a simulation program called FEDEM was chosen. FEDEM (Finite Element Dynamics of Elastic Mechanisms) is a program for simulating the dynamics of complex 2- and 3-dimensional mechanisms, including the elasticities of links. A socket communication between FEDEM and GL view has been implemented. NTIS

A REVIEW OF EUROPEAN APPLICATIONS OF ARTIFICIAL INTELLIGENCE TO SPACE
Mark Drummond, ed. and Helen Stewart, ed. Oct. 1993 62 p
(RTOP 586-02-21)
(NASA-TM-108789; A-93127; NAS 1.15:108789) Avail: CASI HC A04/MF A01

The purpose is to describe the applications of Artificial Intelligence (AI) to the European Space program that are being developed or have been developed. The results of a study sponsored by the Artificial Intelligence Research and Development program of NASA's Office of Advanced Concepts and Technology (OACT) are described. The report is divided into two sections. The first consists of site reports, which are descriptions of the AI applications seen at each place visited. The second section consists of two summaries which synthesize the information in the site reports by organizing this information in two different ways. The first organizes the material in terms of the type of application, e.g., data analysis, planning and scheduling, and procedure management. The second organizes the material in terms of the component technologies of Artificial Intelligence which the applications used, e.g., knowledge based systems, model based reasoning, procedural reasoning, etc. Author (revised)

TRANSITION SYSTEM SPECIFICATIONS IN STALK FORMAT WITH BISIMULATION AS A CONGRUENCE
V. vanOostrom and E. P. deVink Jul. 1993 22 p
(PB94-110608; IR-332) Avail: CASI HC A03/MF A01

A many-sorted variant, called stalk format, of the single sorted tyft-format for transition system specifications is proposed. The stalk format is shown to be a convenient formalism to express continuation-style transition systems for languages incorporating concepts such as, e.g., process creation or backtracking, for which the existing formats seem less adequate. It is proved, extending a similar result for the single sorted case, that for an appropriate generalization of (strong) bisimilarity for the present many-sorted setting, bisimulation with respect to a transition system specification in stalk format is a congruence. It is argued that the several conditions, required for the type of transition system specification put forward in the paper, can not be relaxed without loosing this congruence. Finally, the present format is compared with several existing ones in the literature, viz. De Simone-, GSOS- and pure tyft-format. NTIS

OBJECT DISTRIBUTION IN ORCA USING COMPILE-TIME AND RUN-TIME TECHNIQUES
Hans E. Bal and M. Frans Kaashoek Jul. 1993 19 p See also PB94-110590 and PB93-142594 Sponsored by Netherlands Organization for Applied Scientific Research TNO Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-110574; IR-328) Avail: CASI HC A03

Orca is a language for parallel programming on distributed systems. Communication in Orca is based on shared data-objects, which is a form of distributed shared memory. The performance of Orca programs depends strongly on how shared data-objects are distributed among the local physical memories of the processors. The paper studies a new and efficient solution to this problem, based on an integration of compile-time and run-time techniques. The Orca compiler has been extended to determine the access patterns of processes to shared objects. The compiler passes a summary of this information to the run-time system, which uses it to make good decisions about which objects to replicate and where to store nonreplicated objects. Measurements show that the new system gives better overall performance than any previous implementation of Orca. NTIS

MICRO SIL-1 SIMULATOR
E. Molenkamp 1993 40 p
(PB94-110889; Memo-INF-93-38) Copyright Avail: CASI HC A03/MF A01

In the design flow of a digital system an intermediate is often used to come from a specification language to a realization. In the paper, the intermediate used is SIL-1, the SPRITE Input Language. As specification language the author uses VHDL. This specification is translated into a SIL-1 description, a number of transformations are performed on the generated signal flow graph, and finally is synthesized. During the developing phase of the VHDL to SIL translator, it is necessary to check if the generated SIL-1 graph has the same behavior as the original VHDL description, e.g. to detect programming errors in the translator. Since there is no SIL-1 simulator, the paper describes a simulator for a subset of a SIL-1 graph (structured types and sets are not supported). In many cases a one to one translation from a SIL-1 description to a VHDL description is performed. The generated VHDL description is simulated against the original VHDL description. NTIS

ADVANCED DESIGN CONCEPTS FOR OPEN DISTRIBUTED SYSTEMS DEVELOPMENT
L. F. Pires, M. vanSinderen, and C. A. Vissers 1993 13 p
(PB94-110897; TIOS-93/23) Copyright Avail: CASI HC A03/MF A01

Experience with the engineering of large scale open distributed systems has shown that their design should be specified at several well defined levels of abstractions, where each level aims at satisfying specific user, architectural and implementation purposes. Therefore, designers should dispose of a comprehensive design methodology, which allows them to conceive a specification at a certain abstraction level and transform this specification into a conforming specification at a lower abstraction level. The collection of these transformations should abridge the total design trajectory from initial user requirements to final implementation. The paper presents and discusses some advanced design concepts that provide a basis for such a design methodology. NTIS

ALGORITHM ON ADDITION CHAINS WITH RESTRICTED MEMORY Research Memo
M. J. Coster 1 Jun. 1993 23 p
(PB94-118692; FEW-603) Avail: CASI HC A03/MF A01

This paper considers addition chains, addition sequences and vector addition chains, introducing a new constraint--namely restricted memory--which is important in all of the applications on computers. We consider an algorithm for calculating addition chains, addition sequences, and vector addition chains--namely, a Generalized Continued Fraction Algorithm--which uses just a restricted number of memory locations on the computer. The average length of addition chains/sequences constructed by this algorithm will be calculated using a number of theoretical tools (from Ergodic Theory and Special Function Theory). Finally, this algorithm will be compared to some other known algorithms. NTIS

The topic of the report is the construction of multiprograms, i.e. cooperating sequential programs operating on shared variables. Three different approaches to the construction of multiprograms can be distinguished. The main part of the report consists of a series of derivations; e.g. a derivation of Peterson's (general) mutual exclusion algorithm and of Lamport's Bakery Algorithm. The first four chapters present the theory of Owicki and Gries, develop a small body of useful theorems and introduce the format of the derivations. The last chapter contains a small set of exercises. NTIS

A MATRIX ANALYSIS OF CONJUGATE GRADIENT ALGORITHMS
S. F. Ashby and M. H. Gutknecht (Eidgenoessische Technische Hochschule, Zurich, Switzerland.) Apr. 1993 16 p Presented at the 9th Symposium on Precondition Conjugate Gradients, Yokohama, Japan, 2 Mar. 1993
(Contract W-7405-eng-48)
(DE94-002546; UCRL-JC-113560; CONF-9303237-1) Avail: CASI HC A03/MF A01

This paper explores the relationships between the conjugate gradient algorithms Orthodir, Orthomin, and Orthores. To facilitate this exploration, a matrix formulation for each algorithm is given. It is shown that Orthodir directly computes a Hessenberg matrix H(sub k) at step k. Orthores also computes a Hessenberg matrix, G(sub k), which is similar to a Hessenberg matrix obtained from H(sub k) by perturbing its last column. (This perturbation vanishes at convergence.) Orthomin, on the other hand, computes a UL and LU factorization of the perturbed H(sub k) and G(sub k), respectively. The breakdown of Orthomin and Orthores are interpreted in terms of these underlying matrix factorizations. A connection with Lanczos algorithms is also examined, as is the special case of B-normal(1) matrices (for which efficient three-term CG algorithms exist). DOE

SAO MISSION SUPPORT SOFTWARE AND DATA STANDARDS, VERSION 1.0 Final Report
P. Hsieh Nov. 1993 16 p
(Contract NAS8-36123)
(NASA-CR-193906; NAS 1.26:193906; SAO-AXAF-DR-93-059) Avail: CASI HC A03/MF A01

This document defines the software developed by the SAO AXAF Mission Support (MS) Program and defines standards for the software development process and control of data products generated by the software. The SAO MS is tasked to develop and use software to perform a variety of functions in support of the AXAF mission. Software is developed by software engineers and scientists, and commercial off-the-shelf (COTS) software is used either directly or customized through the use of scripts to implement analysis procedures. Software controls real-time laboratory instruments, performs data archiving, displays data, and generates model predictions. Much software is used in the analysis of data to generate data products that are required by the AXAF project, for example, on-orbit mirror performance predictions or detailed characterization of the mirror reflection performance with energy. ON THE DYNAMICS OF SOME GRID ADAPTION SCHEMES
Peter K. Sweby (Reading Univ., England.) and Helen C. Yee (National Aeronautics and Space Administration. Ames Research Center, Moffett Field, CA.) Feb. 1994 14 p Proceedings of the 4th International Conference on Numerical Grid Generation in Computational Fluid Dynamics and Related Fields held in Swansea, England, 6-8 Apr. 1994 Submitted for publication
(Contract NAS2-13721)
(NASA-CR-195092; NAS 1.26:195092; RIACS-TR-94-02) Avail: CASI HC A03/MF A01

The dynamics of a one-parameter family of mesh equidistribution schemes coupled with finite difference discretisations of linear and nonlinear

convection-diffusion model equations is studied numerically. It is shown that, when time marched to steady state, the grid adaption not only influences the stability and convergence rate of the overall scheme, but can also introduce spurious dynamics to the numerical solution procedure.

UPDATE OF GRASP/Ada REVERSE ENGINEERING TOOLS FOR Ada
James H. Cross, II 14 Dec. 1993 65 p
(Contract NAS8-39131)
(NASA-CR-193890; NAS 1.26:193890) Avail: CASI HC A04/MF A01

The GRASP/Ada project (Graphical Representations of Algorithms, Structures, and Processes for Ada) successfully created and prototyped a new algorithmic level graphical representation for Ada software, the Control Structure Diagram (CSD). The primary impetus for creation of the CSD was to improve the comprehension efficiency of Ada software and, as a result, improve reliability and reduce costs. The emphasis was on the automatic generation of the CSD from Ada PDL or source code to support reverse engineering and maintenance. The CSD has the potential to replace traditional pretty printed Ada source code. In Phase 1 of the GRASP/Ada project, the CSD graphical constructs were created and applied manually to several small Ada programs. A prototype CSD generator (Version 1) was designed and implemented using FLEX and BISON running under VMS on a VAX 11-780. In Phase 2, the prototype was improved and ported to the Sun 4 platform under UNIX. A user interface was designed and partially implemented using the HP widget toolkit and the X Windows System. In Phase 3, the user interface was extensively reworked using the Athena widget toolkit and X Windows. The prototype was applied successfully to numerous Ada programs ranging in size from several hundred to several thousand lines of source code. Following Phase 3,e two update phases were completed. Update'92 focused on the initial analysis of evaluation data collected from software engineering students at Auburn University and the addition of significant enhancements to the user interface. Update'93 (the current update) focused on the statistical analysis of the data collected in the previous update and preparation of Version 3.4 of the prototype for limited distribution to facilitate further evaluation. The current prototype provides the capability for the user to generate CSD's from Ada PDL or source code in a reverse engineering as well as forward engineering mode with a level of flexibility suitable for practical application. An overview of the GRASP/Ada project with an emphasis on the current update is provided.

ASPT SOFTWARE SOURCE CODE: ASPT APPLICATION SOFTWARE PACKAGE, HOST COMPONENT
Hugh Parliament 17 Aug. 1992 171 p
(CTN-94-60907) Avail: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada

The source code for the Adaptive Signal Processing Testbed application software package, host component, is presented. The source code covers the programs 'acqtool', 'aspt acq', 'acq convert', 'evaltool', 'ewacq server', 'aspt convert', and 'plot'. These programs are mainly concerned with data acquisition and data display. The files listed comprise the user interface program and the acquisition server for the testbed's data acquisition software. All of the configuration options for the acquisition and processing are set by the programs, along with the control options for starting and stopping the acquisition via the acquisition server.

A COLOUR IMAGE PROCESSING ALGORITHM TO IDENTIFY COPPER-BASED PARTICLES IN FILTER DEBRIS SAMPLES
K. K. Yeung, G. A. Luoma, and A. J. Mckenzie Mar. 1993 27 p
(DREP-TM-93-19; CTN-94-60918) Avail: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada

In oil-wetted aircraft machinery fitted with coarse filtration systems, sufficient fine particulate wear debris passes through the filter to enable meaningful spectrometric oil analysis (SOA) of the oil sample debris for off-line condition monitoring. The use of fine filters in F404 engines has severely limited the usefulness of oil analysis techniques because the filters remove almost all the debris of significance. Filter debris analysis (FDA) has been developed as an alternative off-line monitoring procedure for those engines. FDA can also supplement conventional oil analysis for condition monitoring of machinery with coarse filtration by evaluating the accumulated wear debris generated between filter changes. The method has been very successful at predicting wear anomalies and is being adopted into the routine maintenance procedures for selected machinery. The main drawbacks of FDA are that it is time consuming, manpower intensive, and prone to subjective interpretation. The use of computer-aided image analysis to interpret filter debris is being investigated with the goal of incorporating FDA results into an expert system for condition monitoring. Results of image capture and interpretation of FDA are presented, and implications of these developments on condition monitoring of oil-wetted machinery are discussed.

THE DETECTION PERFORMANCE OF A LONG-TERM SPECTRAL INTEGRATOR USING NORMALIZED AND QUANTIZED DATA
B. H. Maranda Feb. 1993 35 p
(DREP-TM-93-11; CTN-94-60893) Avail: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada

The standard method for detection of narrowband signals is to use an energy detector implemented by a fast Fourier transform (FFT) followed by a squarer. For display and storage purposes, the FFT spectra are normalized and then quantized, and a long-term noncoherent integration is then attained visually by stacking the quantized spectra in a frequency time intensity (FTI) display, or lofargram. The effect of both normalization and quantization on the narrowband detection performance of a long-term spectral integrator is examined in order to determine whether heavily quantized spectra give adequate performance. The performance is described by the receiver operating characteristic, which is computed numerically from the probability density function of the detection statistic. It is found that the loss in performance due to normalization is small, less than 0.2 dB for an example case. The loss due to quantization depends on the number of bits used. When the quantizer uses only one bit, the loss is about 1 dB. This loss can be decreased to under 0.1 dB by the use of three bits in the quantizer.

The Advanced Communications Electronic Support Measures System (ACES) is a testbed to be used in the development of technologies for an electronic support measures (ESM) system. The system is to be capable of real-time detection and identification of low probability of intercept high and very high frequency communication signals. The user interface subsystem provides the user with a real-time display of the frequency spectrum of received signals. It consists of a personal computer with a high resolution graphics display and an integral digital signal processor card. The ACES Spectral Display software is the software portion of this subsystem. The individual components of this software that support the user interface are described. These include the main routine that calls the upper level routines, initialization and termination routines, user input and output routines, the axis-drawing routine, the color pallet routine, and routines for executing the real-time processing loop. A HOMOTOPY ALGORITHM FOR DIGITAL OPTIMAL PROJECTION CONTROL GASD-HADOC Final Report

Emmanuel G. Collins, Jr., Stephen Richter, and Lawrence D. Davis Oct. 1993 163 p

(Contract NAS8-38575)

(NASA-CR-193881; NAS 1.26:193881) Avail: CASI HC A08/MF A02

The linear-quadratic-gaussian (LQG) compensator was developed to facilitate the design of control laws for multi-input, multi-output (MIMO) systems. The compensator is computed by solving two algebraic equations for which standard closed-loop solutions exist. Unfortunately, the minimal dimension of an LQG compensator is almost always equal to the dimension of the plant and can thus often violate practical implementation constraints on controller order. This deficiency is especially highlighted when considering control-design for high-order systems such as flexible space structures. This deficiency motivated the development of techniques that enable the design of optimal controllers whose dimension is less than that of the design plant. A homotopy approach based on the optimal projection equations that characterize the necessary conditions for optimal reduced-order control. Homotopy algorithms have global convergence properties and hence do not require that the initializing reduced-order controller be close to the optimal reduced-order controller to guarantee convergence. However, the homotopy algorithm previously developed for solving the optimal projection equations has sublinear convergence properties and the convergence slows at higher authority levels and may fail. A new homotopy algorithm for synthesizing optimal reduced-order controllers for discrete-time systems is described. Unlike the previous homotopy approach, the new algorithm is a gradient-based, parameter optimization formulation and was implemented in MATLAB. The results reported may offer the foundation for a reliable approach to optimal, reduced-order controller design. Author (revised)

THE ADAM LANGUAGE: Ada EXTENDED WITH SUPPORT FOR MULTIWAY ACTIVITIES Final Report

Arthur Charlesworth Dec. 1993 65 p

(Grant NAG1-774; RTOP 505-64-10)

(NASA-CR-4565; NAS 1.26:4565) Avail: CASI HC A04/MF A01

The Adam language is an extension of Ada that supports multiway activities, which are cooperative activities involving two or more processes. This support is provided by three new constructs: diva procedures, meet statements, and multiway accept statements. Diva procedures are recursive generic procedures having a particular restrictive syntax that facilitates translation for parallel computers. Meet statements and multiway accept statements provide two ways to express a multiway rendezvous, which is an n-way rendezvous generalizing Ada's 2-way rendezvous. While meet statements tend to have simpler rules than multiway accept statements, the latter approach is a more straightforward extension of Ada. The only nonnull statements permitted within meet statements and multiway accept statements are calls on instantiated diva procedures. A call on an instantiated diva procedure is also permitted outside a multiway rendezvous; thus sequential Adam programs using diva procedures can be written. Adam programs are translated into Ada programs appropriate for use on parallel computers. Author

VERIFICATION AND VALIDATION OF MODELS

Jack P. C. Kleijnen 1993 38 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(PB94-110566; FEW-571) Avail: Issuing Activity (National Technical Information Service (NTIS))

The paper surveys verification and validation of models, especially simulation models in operations research. For verification it discusses the followi ng topics: (1) general good programming practice (such as modular programming), (2) checking intermediate simulation outputs through tracing and statistical testing per module, (3) statistical testing of final simulation outputs against analytical results, and (4) animation. For validation it discusses the following topics: (1) obtaining real-world data; (2) comparing simulated and real data through simple tests such as graphical, Schruben-Turing, and t tests; (3) testing whether simulated and real responses are positively correlated and moreover have the same mean using two new statistical procedures based on regression analysis; (4) sensitivity analysis based on design of experiments and regression analysis, and risk or uncertainty analysis based on Monte Carlo sampling; and (5) white versus black box simulation models. Both verification and validation require good documentation, and are crucial parts of assessment, credibility, and accreditation. A bibliography with 53 references is included. NTIS

SYSTEMS ENGINEERING: A FORMAL APPROACH. PART 3: MODELING METHODS

K. M. vanHee 30 Mar. 1993 113 p See also PB94-101417 and PB94-101391 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(PB94-101409; Computing Science Notes-93/11) Avail: Issuing Activity (National Technical Information Service (NTIS))

In the book a method is a set of guidelines and techniques that can be used for the following tasks: (1) Construction of a model for a system. Two cases are distinguished: Making a model after reality; and transforming a given model into another one. (2) Analysis of a model. Again, two cases are distinguished: Verifying properties of a model by means of a formal proof; and validating a model by means of simulation of the behavior of the model. NTIS

FAST FOURIER TRANSFORMS OF PIECEWISE CONSTANT FUNCTIONS

Eugene Sorets Sep. 1993 21 p

(Grant NSF DMS-90-12135)

(AD-A272648; YALEU/DCS/RR-986) Avail: CASI HC A03/MF A01

We present an algorithm for the evaluation of the Fourier transform of piecewise constant functions of two variables. The algorithm overcomes the accuracy problems associated with computing the Fourier transform of discontinuous functions; in fact, its time complexity is O(log(3)(1/epsilon)N(2) + log(2)(1/epsilon)(N(2)log N)), where epsilon is the accuracy and N is the size of the problem. The algorithm is based on the Lagrange interpolation formula and the Green's theorem, which are used to preprocess the data before applying the fast Fourier transform. It admits natural generalizations to higher dimensions and to piecewise smooth functions. DTIC

AN AUTOMATED TOOL TO FACILITATE CODE TRANSLATION FOR SOFTWARE FAULT TREE ANALYSIS M.S. Thesis
Robert R. Ordonio Sep. 1993 211 p
(AD-A273205) Avail: CASI HC A10/MF A03

A safe system is defined as a system that prevents unsafe states from producing safety failures, where an unsafe state is defined as a state that may lead to safety failure unless some specific action is taken to avert it. The problem addressed is how to find places in Ada programs where faults are likely to occur during program execution. The approach is to build an automated translation tool that translates Ada programs into a software fault tree. The tool works as follows: (1) The Ada parser and lexical analyzer calls the Automated Code Translation Tool (ACTT) upon recognition of an Ada statement; (2) The ACTT produces a template representing the statement; (3) The templates are linked together as a software fault tree. The result is a program that takes Ada source code as input and produces a software fault tree as output. DTIC

COMBINATORY REDUCTION SYSTEMS: INTRODUCTION AND SURVEY
J. W. Klop, V. vanOostrom, and F. vanRaamsdonk 1993 30 p Prepared in cooperation with Centrum voor Wiskunde en Informatica, Amsterdam (Netherlands) Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-110582) Avail: CASI HC A03

Combinatory Reduction Systems (CRS's) were designed to combine the usual first-order format of term rewriting with the presence of bound variables as in pure lambda-calculus and various typed lambda-calculi. The paper introduces the class of orthogonal CRS's, illustrated with many examples, discusses its expressive power, and gives an outline of a short proof of confluence. There is a well-known connection between the parallel reduction and the concept of 'developments', and a classical lemma in the theory of lambda-calculus is that of 'Finite Developments', a strong normalization result. It turns out that the notion of 'parallel reduction' gives rise to a generalized form of developments, called 'superdevelopments' and on which it briefly comments. It concludes by mentioning the results of a comparison of CRS's with the recently proposed and strongly related format of higher-order rewriting: Nipkow's HRS's (Higher-order Rewrite Systems). NTIS

A PROGRAMMING ENVIRONMENT FOR DISTRIBUTED COMPLEX COMPUTING. AN OVERVIEW OF THE FRAMEWORK FOR INTERDISCIPLINARY DESIGN OPTIMIZATION (FIDO) PROJECT. NASA LANGLEY TOPS EXHIBIT H120B
James C. Townsend, Robert P. Weston, and Thomas M. Eidson (High Technology Corp., Hampton, VA.) Dec. 1993 15 p
(RTOP 505-59-53-08)
(NASA-TM-109058; NAS 1.15:109058) Avail: CASI HC A03/MF A01

The Framework for Interdisciplinary Design Optimization (FIDO) is a general programming environment for automating the distribution of complex computing tasks over a networked system of heterogeneous computers. For example, instead of manually passing a complex design problem between its diverse specialty disciplines, the FIDO system provides for automatic interactions between the discipline tasks and facilitates their communications. The FIDO system networks all the computers involved into a distributed heterogeneous computing system, so they have access to centralized data and can work on their parts of the total computation simultaneously in parallel whenever possible. Thus, each computational task can be done by the most appropriate computer. Results can be viewed as they are produced and variables changed manually for steering the process. The software is modular in order to ease migration to new problems: different codes can be substituted for each of the current code modules with little or no effect on the others. The potential for commercial use of FIDO rests in the capability it provides for automatically coordinating diverse computations on a networked system of workstations and computers. For example, FIDO could provide the coordination required for the design of vehicles or electronics or for modeling complex systems. Author

FAST SIMULATION OF PACKET LOSS RATES IN A SHARED BUFFER COMMUNICATIONS SWITCH Final Report
Cheng-Shang Chang (National Tsing Hua Univ., Hsinchu, Taiwan.), Philip Heidelberger, and Perwez Shahabuddin (International Business Machines Corp., Yorktown Heights, NY.) Nov. 1993 23 p Submitted for publication

(Contract NAS1-19480; RTOP 505-90-52-01)
(NASA-CR-191556; NAS 1.26:191556; ICASE-93-79) Avail: CASI HC A03/MF A01

This paper describes an efficient technique for estimating, via simulation, the probability of buffer overflows in a queueing model that arises in the analysis of ATM (Asynchronous Transfer Mode) communication switches. There are multiple streams of (autocorrelated) traffic feeding the switch that has a buffer of finite capacity. Each stream is designated as either being of high or low priority. When the queue length reaches a certain threshold, only high priority packets are admitted to the switch's buffer. The problem is to estimate the loss rate of high priority packets. An asymptotically optimal importance sampling approach is developed for this rare event simulation problem. In this approach, the importance sampling is done in two distinct phases. In the first phase, an importance sampling change of measure is used to bring the queue length up to the threshold at which low priority packets get rejected. In the second phase, a different importance sampling change of measure is used to move the queue length from the threshold to the buffer capacity. Author

Avail: CASI HC A02/MF A01

Efforts to improve the performance of lasers used as spectroscopic probes or as measurement tools have resulted in significant refinements of the properties of the laser light: higher power, higher spectral brightness, longer coherence length and coherence time, and shorter pulses. These efforts have also uncovered novel nonlinear responses in the laser itself and in its interaction with matter; these new phenomena challenge our understanding of laser dynamics and of the interaction of laser radiation with matter. This paper will describe some anomalous behavior arising from nonlinearities in laser processes and in material response. It will examine the nonlinearities that arise from inter-ionic processes and from stimulated emission and discuss the difficulties introduced by these nonlinearities in computations required to predict laser performance and the response of a nonlinear medium to laser excitation. Examples of these phenomena will be drawn from the YAG:Tm,Ho solid state laser system. Author (revised)

This paper describes two new ideas by which an HPF compiler can deal with irregular computations effectively. The first mechanism invokes a user specified mapping procedure via a set of compiler directives. The directives allow use of program arrays to describe graph connectivity, spatial location of array elements, and computational load. The second mechanism is a simple conservative method that in many cases enables a compiler to recognize that it is possible to reuse previously computed information from inspectors (e.g. communication schedules, loop iteration partitions, information that associates off-processor data copies with on-processor buffer locations). We present performance results for these mechanisms from a Fortran 90D compiler implementation. Author

A COMPARISON OF APPROXIMATE INTERVAL ESTIMATORS FOR THE BERNOULLI PARAMETER Final Report
Lawrence Leemis (College of William and Mary, Williamsburg, VA.) and Kishor S. Trivedi (Duke Univ., Durham, NC.) Dec. 1993 17 p Submitted for publication
(Contract NAS1-19480; RTOP 505-90-52-01)
(NASA-CR-191585; NAS 1.26:191585; ICASE-93-97) Avail: CASI HC A03/MF A01

The goal of this paper is to compare the accuracy of two approximate confidence interval estimators for the Bernoulli parameter p. The approximate confidence intervals are based on the normal and Poisson approximations to the binomial distribution. Charts are given to indicate which approximation is appropriate for certain sample sizes and point estimators. Author

AN INVESTIGATION OF REQUIREMENTS TRACEABILITY TO SUPPORT SYSTEMS DEVELOPMENT M.S. Thesis
Gale A. Harrington and Kathleen M. Rondeau Sep. 1993 94 p
(AD-A273167) Avail: CASI HC A05/MF A01

Department of Defense Standard 2167A mandates that requirements traceability be conducted during the development of government systems. This and other standards, as well as current literature, however, do not provide a comprehensive model of what information should be captured as a part of a traceability scheme. The primary goal of this research is to develop a model of requirements traceability at the level of systems design which relates requirements to all system components. An empirical study using focus groups was conducted with various stakeholders involved with the development of large, complex systems. Based on an analysis of the information obtained by the focus group sessions, a model for traceability was developed. This model describes the various relationships or linkages between requirements and system components that must be captured and maintained to support various system development activities. Finally, several issues which must be addressed in successfully implementing a comprehensive scheme for traceability are discussed. DTIC

A TYPE-THEORETIC APPROACH TO HIGHER-ORDER MODULES WITH SHARING
Robert Harper and Mark Lillibridge Oct. 1993 23 p
(Contract F19628-91-C-0168; ARPA Order 8313)
(AD-A273566; CMU-CS-93-197) Avail: CASI HC A03/MF A01

The design of a module system for constructing and maintaining large programs is a difficult task that raises a number of theoretical and practical issues. A fundamental issue is the management of the flow of information between program units at compile time via the notion of an interface. Experience has shown that fully opaque interfaces are awkward to use in practice since too much information is hidden, and that fully transparent interfaces lead to excessive interdependencies, creating problems for maintenance and separate compilation. The 'sharing' specifications of Standard ML address this issue by allowing the programmer to specify equational relationships between types in separate modules, but are not expressive enough to allow the programmer complete control over the propagation of type information between modules. These problems are addressed from a type-theoretic viewpoint by considering a calculus based on Girard's system F(sub omega). The calculus differs from those considered in previous studies by relying exclusively on a new form of weak sum type to propagate information at compile-time, in contrast to approaches based on strong sums which rely on substitution. The new form of sum type allows for the specification of equational, as well as type and kind, information in interfaces. This provides complete control over the propagation of compile-time information between program units and is sufficient to encode in a straightforward way most uses of type sharing specifications in Standard ML. AN INTEGRATED RUNTIME AND COMPILE-TIME APPROACH FOR PARALLELIZING STRUCTURED AND BLOCK STRUCTURED APPLICATIONS Final Report
Gagan Agrawal (Maryland Univ., College Park.), Alan Sussman (Maryland Univ., College Park.), and Joel Saltz (Maryland Univ., College Park.) Oct. 1993 33 p Submitted for publication
(Contracts NAS1-19480; NAG1-1485; ONR-SC-292-1-22913; NSF ASC-92-13821; RTOP 505-90-52-01)
(NASA-CR-191554; NAS 1.26:191554; ICASE-93-77) Avail: CASI HC A03/MF A01

Scientific and engineering applications often involve structured meshes. These meshes may be nested (for multigrid codes) and/or irregularly coupled (called multiblock or irregularly coupled regular mesh problems). A combined runtime and compile-time approach for parallelizing these applications on distributed memory parallel machines in an efficient and machine-independent fashion was described. A runtime library which can be used to port these applications on distributed memory machines was designed and implemented. The library is currently implemented on several different systems. To further ease the task of application programmers, methods were developed for integrating this runtime library with compilers for HPK-like parallel programming languages. How this runtime library was integrated with the Fortran 90D compiler being developed at Syracuse University is discussed. Experimental results to demonstrate the efficacy of our approach are presented. A multiblock Navier-Stokes solver template and a multigrid code were experimented with. Our experimental results show that our primitives have low runtime communication overheads. Further, the compiler parallelized codes perform within 20 percent of the code parallelized by manually inserting calls to the runtime library.

VALIDATION ACTIVITIES FOR LOTOS BASED ON STATIC DATA FLOW ANALYSIS M.S. Thesis
H. vanderSchoot 1993 122 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-110863; TIOS-93/21,) Copyright Avail: CASI HC A06

The thesis discusses data flow based validation of Full LOTOS specifications and their implementations. By performing static data flow analysis, the flow of data expressed in a given LOTOS specification is explicitly exposed. This explicit exposure facilitates two validation activities, namely, data flow anomaly detection and data flow oriented test selection. Data flow anomalies may indicate possible errors in the specification. A new criterion for data flow oriented test selection, called the maximal IO-df-chains criterion, is proposed for selecting a finite set of paths from the specification. The selected paths are subsequently used to guide the generation of executable test sequences. NTIS

A METHODOLOGY FOR SOFTWARE COST ESTIMATION USING MACHINE LEARNING TECHNIQUES M.S. Thesis
Michael A. Kelly 3 Sep. 1993 143 p
(AD-A273158) Avail: CASI HC A07/MF A02

The Department of Defense expends billions of dollars on software development and maintenance annually. Many Department of Defense projects fail to be completed, at large monetary cost to the government, due to the inability of current software cost-estimation techniques to estimate, at an early project stage, the level of effort required for a project to be completed. One reason is that current software cost-estimation models tend to perform poorly when applied outside of narrowly-defined domains. Machine learning offers an alternative approach to the current models. In machine learning, the domain specific data and the computer can be coupled to create an engine for knowledge discovery. Using neural networks, genetic algorithms, and genetic programming along with a published software project data set, several cost estimation models were developed. Testing was conducted using a separate data set. All three techniques showed levels of performance that indicate that each of these techniques can provide software project managers with capabilities that can be used to obtain better software cost estimates. INTELLIGENT SYSTEMS AND ADVANCED USER INTERFACES FOR DESIGN, OPERATION, AND MAINTENANCE OF COMMAND MANAGEMENT SYSTEMS Semiannual Status Report, 1 Apr. - 30 Dec. 1993
William J. Potter and Christine M. Mitchell (Georgia Inst. of Tech., Atlanta.) Dec. 1993 17 p
(Grant NAG5-2226)
(NASA-CR-195172; NAS 1.26:195172) Avail: CASI HC A03/MF A01

Historically, command management systems (CMS) have been large and expensive spacecraft-specific software systems that were costly to build, operate, and maintain. Current and emerging hardware, software, and user interface technologies may offer an opportunity to facilitate the initial formulation and design of a spacecraft-specific CMS as well as to develop a more generic CMS system. New technologies, in addition to a core CMS common to a range of spacecraft, may facilitate the training and enhance the efficiency of CMS operations. Current mission operations center (MOC) hardware and software include Unix workstations, the C/C++ programming languages, and an X window interface. This configuration provides the power and flexibility to support sophisticated and intelligent user interfaces that exploit state-of-the-art technologies in human-machine interaction, artificial intelligence, and software engineering. One of the goals of this research is to explore the extent to which technologies developed in the research laboratory can be productively applied in a complex system such as spacecraft command management. Initial examination of some of these issues in CMS design and operation suggests that application of technologies such as intelligent planning, case-based reasoning, human-machine systems design and analysis tools (e.g., operator and designer models), and human-computer interaction tools (e.g., graphics, visualization, and animation) may provide significant savings in the design, operation, and maintenance of the CMS for a specific spacecraft as well as continuity for CMS design and development across spacecraft. The first six months of this research saw a broad investigation by Georgia Tech researchers into the function, design, and operation of current and planned command management systems at Goddard Space Flight Center. As the first step, the researchers attempted to understand the current and anticipated horizons of command management systems at Goddard. Preliminary results are given on CMS commonalities and causes of low re-use, and methods are proposed to facilitate increased re-use. CASI

THE USE OF DESIGN AUTOMATION SOFTWARE BY GOVERNMENT-CONTRACTED ARCHITECT/ENGINEER FIRMS: A STATUS REPORT Interim Report
Michael L. Golish, Carrie J. McCunn, and Beth A. Symonds Sep. 1993 46 p
(AD-A273181; CERL-IR-FF-93/06) Avail: CASI HC A03/MF A01

Most Architecture and Engineering (A/E) design firms and Corps of Engineers District offices have found that computer-aided design and drafting (CADD) has a great potential for improving productivity, profitability, communication, and design quality. Yet, clients' demand for design and construction information created with CADD and delivered in a variety of specified computer formats can hinder scheduling, quality control, and profitability of A/E firms. This phase of research collected information on the status and use of CADD by A/E firms to identify trends in hardware, software, CADD staffing and compensation, and trends in how design firms that use CADD have accepted this form of automation. Secondary objectives were to determine how CADD has improved design firm productivity, design quality, documentation, and profitability, and to note any outstanding problems associated with the use of CADD in the design process. The second phase will review and analyze reports from the Army's Automated Review Management System (ARMS) and the Construction Evaluation Retrieval System (CERS) to determine how automation has affected Corps review procedures, and to locate and classify repetitive data that may be streamlined in future design and construction projects.

THE HEC NexGen SOFTWARE DEVELOPMENT PROJECT
Darryl W. Davis Jan. 1993 15 p
(AD-A273512; HEC-TP-138) Avail: CASI HC A03/MF A01

The NexGen project, a five year project begun in 1990, is developing successor software packages to the existing family of HEC hydrologic engineering computer programs. The project is being accomplished through a management process that employs teams comprised of technical specialists, computer scientists, and consultants. Modern software engineer methods of requirements analysis, prototype development, field testing, and feedback, are employed. Object-oriented program architecture implemented with C++ and advanced data features of FORTRAN 90 are being used. Prototype models of NexGen software packages in catchment and river analysis are now operational and beta-test versions will be completed at the end of this next year. Final packages are expected to be completed on schedule. The packages will be functional for RISC-chip and Intel-chip based desktop computers. DTIC

PARAMETRIC UNCERTAINTY REDUCTION IN ROBUST MULTIVARIABLE CONTROL Ph.D. Thesis
David L. Krueger Sep. 1993 105 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A273412) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This dissertation presents a method for reducing the number of parametric uncertainties used in the design of a robust H-infinity controller. The resulting controller is shown to meet robust stability and performance requirements in the presence of all the modeled uncertainties. The approach used involves grouping parametric variations affecting the same open loop eigenvalue, then scaling one or more of these variations to accommodate the eigenvalue change caused by all the parametric uncertainties. This method is effective in those cases where a large number of parametric uncertainties cause current computer aided design software to fail to find a robust controller for the plant. DTIC

PERFORMANCE MEASUREMENTS OF THE MULTIMEDIA TESTBED ON MACH 3.0: EXPERIENCE WRITING REAL-TIME DEVICE DRIVERS, SERVERS, AND APPLICATIONS
Roger B. Dannenberg, David B. Anderson, Tom Neuendorffer, Dean Rubine, and Jim Zelenka 21 Jul. 1993 25 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A273600; CMU-CS-93-205) Avail: CASI HC A03

Multimedia has generated a widespread interest in real-time support within general purpose operating systems. In addition to real-time support, multimedia often requires large amounts of data to be moved between devices and processes. The Multimedia Testbed is a set of applications that stress consistent low-latency response and efficient interprocess communication for large blocks of data. The Multimedia Testbed was ported to the Mach 3.0 Operating System where performance was measured. Experiments were conducted to compare various techniques for IPC and disk reads. Experience with fixed priority scheduling, user-level device drivers, and a high-resolution timer are also reported. DTIC

ANALYZING THE PROPERTIES OF USER INTERFACE SOFTWARE
Rick Kazman, Len Bass, Gregory Abowd, and Mike Webb Oct. 1993 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract F19628-90-L-0003)
(AD-A273601; CMU-CS-93-201) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Software architecture is an increasingly important research topic and in this report we investigate the potential role of architecture in evaluating the properties of a system built to a particular architecture. Currently such architectural analysis is complicated for two main reasons: authors of new architectures describe their creations in idiosyncratic terms; and there is no clear way of understanding an architecture with respect to an organization's life cycle concerns--efficiency, maintainability, modifiability, and so forth. This report addresses these shortcomings by proposing a domain-based method for analyzing software architectures called SAAM (Software Architecture Analysis Method). DTIC

DECLARATIVE OBJECT MANIPULATION ENVIRONMENT (DOME): ALPHA VERSION Final Report
R. A. Whitehurst and John Pietrzak Sep. 1993 56 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DA Proj. 4A1-62784-AT-41)
(AD-A273233; CERL-TR-FF-93/12) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The Declarative Object Manipulation Environment (DOME) is a programming language developed as part of the Integrated Systems Language Environment (ISLE) that combines elements of object-oriented programming with knowledge-based and declarative programming facilities. The alpha version of this system, named ModLog (for 'Modular Logic') was built as a declarative extension to the Army's ModSim language. This report traces the evolution of declarative programming extensions from their beginnings in the Prolog programming language, through ModLog, to the first implementation of the DOME system. The integration of process-based simulation with DOME's declarative rule-based capabilities creates a powerful modeling paradigm that is superior to conventional imperative approaches. DTIC

GENERALIZED LINEAR MIXED MODELS AND THEIR APPLICATION IN PLANT BREEDING RESEARCH Ph.D. Thesis
Johannes Jansen 1993 143 p
(ETN-94-95335) Avail: CASI HC A07/MF A02

Variance components play a prominent role in applications of plant breeding research involving discrete data. The study shows that the class of Generalized Linear Mixed Models (GLMM's) provides a powerful and unified way of modeling discrete data involving variance components. The generalized linear mixed model is described. The Gaussian-Hermite quadrature, used for approximating integrals in the likelihood function of a GLMM is presented. It is shown, for a simple GLMM, that maximum likelihood estimation of the fixed effects and the variance component representing between-unit variation can be carried out by iterative weighted least squares. The use of a parametric family of link functions is considered. It is shown that the maximum likelihood estimates of the variance component of a GLMM are based downwards. A threshold model for ordinal data, which contains a GLMM for binary/binomial data as a special case, is summarized. It is argued that for ordinal data a distinction between lack of fit and between-unit variation should be made. It is shown that the methods for ordinal data can be extended to copy with more than one variance component. For Poisson counts involving two variance components, the simplification is approximated by a quadratic function. ESA

BINARY BLOCK CODES FOR CORRECTING ASYMMETRIC OR UNIDIRECTIONAL ERRORS Ph.D. Thesis
Gang Fang 1993 104 p
(ETN-94-95337) Avail: CASI HC A06/MF A02

Bounds and constructions of Asymmetric or Unidirectional Error Correcting

(AsEC or UEC) codes are studied. The properties of codes for correcting asymmetric errors are investigated. The uniqueness of optimal block codes and the properties of uniformly weakly perfect codes are considered. Basic results for obtaining bounds on the maximum sizes of codes for correcting asymmetric errors are given. Most of these results can be applied to codes for correcting unidirectional errors. Bounds on the maximum size of binary block, t-AsEC and t-UEC of length less than or equal to 27 with t greater than or equal to 5 and t less than or equal to 8 are considered. The uniqueness of optimal 1-AsEC codes of length less than 9 is discussed. ESA

REENGINEERING REAL-TIME SOFTWARE SYSTEMS M.S. Thesis
Randall C. Scott 9 Sep. 1993 72 p
(AD-A273408) Avail: CASI HC A04/MF A01

The problem this thesis solves is how to reengineer existing real-time applications implemented without software engineering (SE) attributes, with poor modularity and robustness, and that are difficult to read and maintain. The real-time system chosen for this study was the Model-based Mobile robot Language (MML) used on the Yamabico-11 mobile robot, which was implemented without SE attributes. The approach taken was reengineering MML with a focus on improving modifiability while preserving functionality. First we developed a systematic plan using manual static analysis, then we incrementally reengineered the application with thorough system-level testing. Code review was used to locate and remove dead code, and synonymous and redundant variables and functions (improving modifiability, readability and robustness). Call-hierarchy tracing was used to gain explicit module restructuring insight for tighter cohesion (improving modifiability, modularity, and readability). Global-variable tracing was used to improve module coupling by localizing and minimizing global variables (improving modularity, readability, and robustness). The results were as follows: a method for applying SE to existing real-time applications after-the-fact called 'Reengineering Real-Time Software Systems' was developed, which improves modifiability, modularity, robustness and readability. MML now has improved modularity and robustness, and is easier to read and maintain. DTIC

AREA-POWER-DELAY TRADE-OFF IN LOGIC SYNTHESIS Ph.D. Thesis
Michel R. C. M. Berkelaar 1992 128 p
(ISBN-9-09-005332-8; ETN-94-95295) Copyright Avail: CASI HC A07/MF A02

New concepts to perform area-power-delay tradeoffs in a logic synthesis system are discussed. To achieve this, a delay model which gives accurate delay estimations for arbitrary sets of Boolean expressions is presented. Algorithms for a number of different optimization tasks within logic synthesis are presented. There are algorithms to create prime irredundant Boolean expressions, to perform technology mapping for use with standard cell generators, and to perform gate sizing. A view of computer aided very large scale integration design and the synthesis of a system named EUCLID (Eindhoven University Combinatorial Logic Implementation system with Decomposition) are given. Basic problems of logic synthesis are discussed. The issue of prime irredundant expressions, which is important for testability of the design, is analyzed. A new algorithm based on Shannon expansion is presented. A basic delay model is derived, and extended to be used in all stages of the logic synthesis process. The technology mapping problem for generated basic cells and the gate sizing problem are discussed. ESA

N94-25138# Naval Postgraduate School, Monterey, CA.
AN IMPLEMENTATION OF THE REPRESENTATION AND MAINTENANCE OF PROCESS KNOWLEDGE (REMAP) MODEL IN THE KNOWLEDGE-BASED SOFTWARE ASSISTANT CONCEPT DEMONSTRATION SYSTEM M.S. Thesis
Frank J. Hughes and Steven C. Kendall Sep. 1993 82 p
(AD-A273207) Avail: CASI HC A05/MF A01

The REpresentation and MAintenance of Process knowledge (REMAP) model supports the various stakeholders involved in software design during development and maintenance by capturing the rationale behind design decisions. This process knowledge is invaluable with changing requirements and assumptions. In the context of formal software development, process knowledge about the development of formal specifications from informal requirements will facilitate the understanding and maintenance of such specifications. We have implemented the REMAP model in the United States Air Force Rome Laboratory's KBSA Concept Demonstration system (a formal software development environment) to capture this process knowledge. We provide a graphical browser to facilitate the instantiation, browsing and modification of REMAP model primitives and a mechanism to reason with the knowledge in the Concept Demonstration system. REUSE-DRIVEN SOFTWARE PROCESSES GUIDEBOOK, VERSION 02.00.03
Nov. 1993 400 p Supersedes AD-A259404. See also AD-A259405
(Contract MDA972-92-J-1018)
(AD-A273644; SPC-92019-CMC) Avail: CASI HC A17/MF A04

The Reuse-Driven Software Processes Guidebook describes the Synthesis family of reuse-driven software development processes. In particular, it prescribes the practice for two example members of this family, illustrating the different stages of reuse capability that can be addressed by this family. Development organizations choose the process that matches their reuse goals. Synthesis is a comprehensive, business-area-level solution to problems of software productivity and quality in the building of systems to meet diverse and changing needs. Synthesis is most appropriate for development organizations that produce many similar systems or single unique systems with highly-volatile requirements during system development and maintenance. Synthesis is a systematic approach to software development founded on the belief that the resources of a business-area organization should be managed not only to meet the immediate needs of customers, but also as an investment in future capability. This guidebook serves as a detailed guide to the practice of Synthesis, addressing all activities and work products related to the production of software, in support of the needs and objectives of a business-area organization and its customers. REUSE ADOPTION GUIDEBOOK, VERSION 02.00.05
Nov. 1993 280 p
(Contract MDA972-92-J-1018)
(AD-A273652; SPC-92051-CMC) Avail: CASI HC A13/MF A03

The Reuse Adoption Guidebook was produced for use by organizations to assist them in improving their competitiveness through the adoption and institutionalization of software reuse technology. Reuse refers to the use of a software asset in the solution of different problems or different versions of a problem. While many forms of reuse technology are currently available and the technology can address many different organizational objectives, crafting the opportunities into an implementable program that meets a particular organization's objectives is a difficult task. This guidebook prescribes a reuse adoption process to help perform that task. A key component in the reuse adoption process is a Reuse Capability Model, which is a tool that can aid an organization in understanding its current capabilities and in establishing goals for its reuse adoption process. DARPA DICE MANUFACTURING OPTIMIZATION Quarterly Technical Report No. 7, 1 Jul. - 30 Sep. 1993
Linda J. Lapointe and Robert F. Bryant 1993 25 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract MDA972-92-C-0020; ARPA Order 8363)
(AD-A273345) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This is the Quarterly Technical Report for the DARPA DICE Manufacturing Optimization. The goal of the Manufacturing Optimization (MO) system is to facilitate a two tiered team approach to the product/process development cycle where a product design is analyzed by multiple manufacturing engineers, and product/process changes are traded concurrently in the product and process domains. The system will support Design for Manufacturing and Assembly (DFMA) with a set of tools to model manufacturing processes, and manage tradeoffs across multiple processes. The subject of this report is the technical work accomplished during the seventh quarter of the contract. The main thrust of the seventh quarter was integration and test of the MO software and the development of the MO user manual. Highlighted in this report is the tutorial section of the user manual. DESIGN AND IMPLEMENTATION OF A DISTRIBUTED VERSION OF THE NASA ENGINE PERFORMANCE PROGRAM Final Report
Jeffrey T. Cours Mar. 1994 62 p
(Grant NAG3-1369; RTOP 505-69-50)
(NASA-CR-194475; E-8619; NAS 1.26:194475) Avail: CASI HC A04/MF A01

Distributed NEPP is a new version of the NASA Engine Performance Program that runs in parallel on a collection of Unix workstations connected through a network. The program is fault-tolerant, efficient, and shows significant speed-up in a multi-user, heterogeneous environment. This report describes the issues involved in designing distributed NEPP, the algorithms the program uses, and the performance distributed NEPP achieves. It develops an analytical model to predict and measure the performance of the simple distribution, multiple distribution, and fault-tolerant distribution algorithms that distributed NEPP incorporates. Finally, the appendices explain how to use distributed NEPP and document the organization of the program's source code. Author (revised)

UNDERSTANDING AND FACILITATING DISCOVERY LEARNING IN COMPUTER-BASED SIMULATION ENVIRONMENT Ph.D. Thesis
Wouter Reinder vanJoolingen 1993 210 p
(ISBN-9-03-860242-1; ETN-94-95320) Avail: CASI HC A10/MF A03

Computer simulations are presented as a mean for creating exploratory learning environments. The global instructional characteristics are discussed. The notions of constructivism and exploratory learning are given. Based on the structure of exploratory learning environment, both from the simulationist and from qualitative reasoning research and the theory on exploratory and inductive learning, a theoretical framework for describing the most important exploratory learning processes is presented. The domain and the simulation environment used are described. An instrument for supporting hypothesis formation, which can be used for starting hypothesis, a hypothesis scratchpad, is presented. The effect of supplying the learner with such an instrument under different conditions is investigated. The conditions under which the learners apply specific subprocesses of hypothesis formation are discussed. A computer program for making automatic analysis of hypotheses stated by the learner is presented. ESA

DESIGNS WITH A SMALL NUMBER OF RUNS FOR FACTORIAL EXPERIMENTS Ph.D. Thesis
Pieter Martinus Upperman 1993 268 p
(ISBN-9-03-860162-X; ETN-94-95323) Avail: CASI HC A12/MF A03

Nearly 40 designs for quantitative factors are developed. Aspects of linear regression theory and experimental design such as the linear regression model, D and G efficiency, and the techniques of replacement and collapsing are overviewed. Methods to find D optimal experimental designs for the incomplete quadratic model in which d variables have linear and quadratic terms, but the other (k - d) variables have only linear terms, are presented. These D optimal designs were constructed to be able to calculate the D efficiencies of a large number of designs. A measure of orthogonality, the variance inflation factor, is introduced. Two applications of the designs developed and two methods to construct designs with 16 experimental units are given. New designs with two and three level factors are developed using orthogonal columns of some main effect designs. The 39 new and six existing designs are discussed and compared using various design characteristics. ESA

ON CHAIN CODING OF LINE DRAWINGS Ph.D. Thesis
Kun Liu 1992 181 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISBN-9-06-275778-2; ETN-94-95366) Copyright Avail: CASI HC A09

The digital encoding of (handwritten) line drawings is addressed. Focus is on real time image coding of handwriting by adopting space sampling. Design and the performance of chain codes depend on the characteristics of the line drawing source being dealt with. Statistical modeling of line drawings is, thus, an important issue. For chain coding of handwriting, probabilistic spatial distributions of sampled line segments are empirically studied and analytically modeled. Based on this, the performance in terms of distortion and coding efficiency is analyzed and compared for a class of standard chain codes. In particular, the relationship between the distortion and the rate of a chain code is established, which provides a quantitative means for the design of practical chain coding systems with desired performance. For given chain codes of line drawings, the problem of generating efficient binary representation for real time transmission is considered. The problem is studied with considerations of possible bit errors caused by the physical limitations of real transmission channels. The performance of a class of chain encoding schemes is determined and compared within this framework. By exploiting the correlation between adjacent spatially quantized line segments, these encoding schemes permit more reduction of encoded data rate than the standard chain coding. The chain coding technique for real time handwriting is also applied to facsimile coding of line graphic blocks often found in mixed mode documents in multimedia applications. The performance of standard chain coding, in terms of data compression, is compared with that of run length coding. It is quantitatively shown that chain coding permits higher coding efficiency, provided that the total length of curves within a block is not excessive. The critical value of the total curve length is derived for which chain coding becomes less efficient. ESA

FROM CIRCUIT TO SIGNAL: DEVELOPMENT OF A PIECEWISE LINEAR SIMULATOR Ph.D. Thesis
Hendrik Willem Buurman 1993 129 p
(Grant EEL66.1206)
(ISBN-9-09-005713-7; ETN-94-95356) Copyright Avail: CASI HC A07/MF A02

The development of the electronic circuit simulator called PLATO (Piecewise Linear Analysis Tool) is described. An insight in the choices of the algorithms used in the creation of an efficient simulator is given. The basics of the piecewise modeling technique are introduced. Several of its basic properties are derived and a theorem on the existence of solutions is proved. Examples show the capabilities of the modeling. The models have three different types of variables and equations: linear, dynamic, and piecewise linear. The basic data structures are introduced and the solution algorithm for the linear equations is discussed. The Van de Panne algorithm is presented. A method to find a DC solution is given. The solution of the dynamic equations is discussed and the multirate integration method is investigated. The combination of the Van de Panne algorithm and the integration method is also discussed. Several aspects of the implementation, to improve the efficiency and accuracy of the simulator, are considered. Examples of systems simulated with PLATO are shown. Conclusions are formulated and future extensions are discussed. A 'small' model for certain functions is derived and non-standard notations are explained. ESA

This report identifies hardware and software issues associated with the transition of computerized tests from old hardware and software configurations to currently available hardware and software. Hardware issues addressed include the following: real-time clock performance, storage devices, video adapter, central processing unit (CPU), and CPU processing speed. Software issues addressed include conversion from PASCAL to C code and hardware-dependent routines. DTIC

UNWRAPPING THE PHASE RESPONSE FUNCTIONS FOR NONLINEAR SYSTEMS
H. Zhang and S. A. Billings 7 Dec. 1992 29 p

(Grant SERC-GR/F-8564.2)
(RR-465; ETN-94-95133) Avail: CASI HC A03/MF A01

The phase unwrapping problem for nonlinear systems was studied. Two algorithms were developed to unwrap the higher order generalized phase response functions. The higher order phase response functions contain important information about the behavior of nonlinear systems. Algorithms based on integrating the partial derivatives of the phase and using multiples of 2pi to amend the principle value were derived and implemented. The use of unwrapped phase allows the entire phase response to be calculated by superposing the phase of the various factors. The parametric estimation approach for the generalized frequency response functions provides a powerful tool for the analysis of nonlinear systems in the frequency domain. ESA

GENETIC ALGORITHMS IN CONTROL SYSTEMS ENGINEERING
P. J. Fleming and C. M. Fonseca 15 Mar. 1993 9 p Sponsored by Junta Nacional de Investigacao Cientifica e Tecnologia, Portugal
(RR-470; ETN-94-95137) Avail: CASI HC A02/MF A01

Recent control applications of genetic algorithms are discussed. Genetic algorithms are adaptive search techniques, based on the principles of natural genetics and natural selection, which, in control systems engineering, can be used as an optimization tool or as the basis of general adaptive systems. The versatile and robust qualities of these algorithms are reviewed and their relevance for control systems is highlighted. Applications and implementation issues including parallelization are addressed. Prospective future directions are identified. ESA

TWO-DIMENSIONAL PATTERN ANALYSIS AND CLASSIFICATION USING A COMPLEX ORTHOGONAL ESTIMATION ALGORITHM
K. M. Tsang (Hong Kong Polytechnic, Kowloon.) and S. A. Billings 1993 31 p
(RR-475; ETN-94-95141) Avail: CASI HC A03/MF A01

An orthogonal estimation algorithm is derived. The algorithm is developed to evaluate parameters associated with the complex autoregressive boundary model of two dimensional shapes. It is shown that the coefficients of the orthogonal model and the original system parameters are invariant to rotation around the origin, to the choice of starting point in tracing the boundary, and to scale and translation. The error reduction ratios derived can be used to detect which terms should be included in the system model. The classification based on the orthogonal parameters is shown to be less susceptible to incorrect model order specification. The classification based on orthogonal data sets is also derived. It is demonstrated that this approach can avoid some problems associated with classification based on the model parameters alone. ESA

NEW ALGORITHM FOR MINIMIZING (CHI)(SUP 2) FUNCTIONALS WITH CONSTRAINTS
A. Zh. Ketikyan, E. V. Komissarov, V. S. Kurbatov, and I. N. Silin 1991 10 p In RUSSIAN Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616800; JINR-R-10-91-482) Avail: CASI HC A02 (US Sales Only)

The problem of minimization of the functional is considered. A new algorithm is proposed for the solution of these problems. It is based on simultaneous linearization of the experimental constraint functions followed by expression of some variables in terms of others. Expressions for covariance matrix are provided, and an algorithm for the minimum search is presented. In comparison with the Lagrange multipliers method, this algorithm requires less computation and is applicable to a wider class of problems. DOE

CADBIT 2: COMPUTER-AIDED DESIGN FOR BUILT-IN TEST, VOLUME 1 Final Report
Michael Davis, Sonny Kwan, and Tony Holzer Jun. 1993 79 p
(Contract F30602-90-C-0116)
(AD-A273702; HMSC-CADBIT-FR-93-1; RL-TR-93-117-Vol-1) Avail: CASI HC A05/MF A01

The objective of CADBIT 2 was to develop a CAD workstation-based system with software to help designers incorporate Built-In Test (BIT) in their CAD-based circuit board designs. The CADBIT 2 system consists of a Unix-based workstation, electronic CAD software, and the contractor-developed CADBIT 2 software module. CADBIT II benefits printed circuit board designers through four major functions. The Tutorial function increases awareness and understanding of Built-In Test techniques. This function offers on-line access to an extensive database of information on current techniques used to implement built-in test in digital, analog, and hybrid (mixed digital and analog) circuit boards. The Selection function helps designers choose the best technique for their design. The selection log compares characteristics and attributes of each BIT technique in the CADBIT database to information about the user's specific 'Circuit Under Test'. The CAD Insertion function helps designers implement a selected BIT technique in a CAD schematic. This function provides a Default Design: with a consistent set of components to implement the selected BIT technique. The Evaluation function analyzes the design impact of adding Built-In-Test circuitry based on total board area, weight, and power 'penalties' for each BIT. DTIC

A SOFT ROBOT INTERFACE
Y. K. H. Lau 1992 25 p Sponsored in part by Croucher Foundation
(OUEL-1948/92; ETN-94-95155) Avail: CASI HC A03/MF A01

A hardware design and production mechanism in which special purpose hardware is generated mainly by a software engineering process is described. By specifying the essential requirements of a device in Communicating Sequential Processes (CSP), mapping the CSP specification into a subset of OCCAM, compiling the OCCAM program into netlist descriptions of parallel hardware which can be implemented using field programmable gate arrays, a cost effective and time saving way of hardware production is described. The resultant hardware has the advantage of being dynamically reconfigurable through the alteration of software. Furthermore, as the overall design mechanism is based on formal mathematics, the hardware specification and the compiler are provably correct, meaning that the developed devices will have a high degree of correctness. Such a product is suitable for applications in safety critical systems. The application of this hardware generating mechanism in the design and development of an intelligent multi axis encoder interface can be obtained. The device interfaces to a real world robot and a transputer based control system. As it is implemented using a field programmable gata array, its embedded intelligence may be enhanced at any stage of the development. The described hardware generation mechanism is evaluated and its practicality in solving real world problems is demonstrated. ESA

EXTRACTING PROJECTIVE INFORMATION FROM SINGLE VIEWS OF 3D POINT SETS
C. A. Rothwell, D. A. Forsyth, A. Zisserman, and J. L. Mundy Feb. 1993 22 p Sponsored by General Electric; Oxford Univ., England; Iowa Univ.; and EEC
(OUEL-1973/93; ETN-94-95158) Avail: CASI HC A03/MF A01

Projectively invariant indexing functions, given some structural assumptions, are constructed for three dimensional point sets. Projective invariants are derived for two classes of object: the first is for points that lie on the vertices of polyhedra, and the second for objects that are projectively equivalent to ones possessing a bilateral symmetry. The first approach extends to structures whose features can be embedded within conceptual polyhedra and is called caging. The recovery of the projective structure of polyhedra and the application to caging point sets are described. The recovery of projective structure for objects with bilateral symmetry is discussed. The motivations for computing such invariants are: they can be used for recognition; they can be used to compute projective structure. Examples of invariants computed from real images are given. ESA

Message passing is a common method for writing programs for distributed-memory parallel computers. Unfortunately, the lack of a standard for message passing has hampered the construction of portable and efficient parallel programs. In an attempt to remedy this problem, a number of groups have developed their own message-passing systems, each with its own strengths and weaknesses. Chameleon is a second-generation system of this type. Rather than replacing these existing systems, Chameleon is meant to supplement them by providing a uniform way to access many of these systems. Chameleon's goals are to (1) be very lightweight (low over-head), (2) be highly portable, and (3) help standardize program startup and the use of emerging message-passing operations such as collective operations on subsets of processors. Chameleon also provides a way to port programs written using PICL or Intel NX message passing to other systems, including collections of workstations. Chameleon is tracking the Message-Passing Interface (MPI) draft standard and will provide both an MPI implementation and an MPI transport layer. Chameleon provides support for heterogeneous computing by using p4 and PVM. Chameleon's support for homogeneous computing includes the portable libraries p4, PICL, and PVM and vendor-specific implementation for Intel NX, IBM EUI (SP-1), and Thinking Machines CMMD (CM-5). Support for Ncube and PVM 3.x is also under development. DOE

The paper describes the design and implementation of a complex object server for the distributed operating system Amoeba. The server is called ACOS (Amoeba Complex Object Server). In order to meet the requirements of non-standard database environments, a complex object server has to provide a high performance. The authors show how they want to control the expected performance of ACOS during its design. By using a top-down design/implementation method, in which a simulation model is evolved into a real system by gradual addition of detail, they want to detect performance bottlenecks in as early a stage as possible. In this way, they expect to obtain an optimal physical design for ACOS. NTIS

The purpose is to investigate a modeling concept named Stochastic Automata Network (SAN). Many modeling tools were realized in order to analyze systems' dynamic behavior. The performance of these tools depends on the expression power, large systems analysis and numerical or analytical resolution. The work into these axes motivated the conception of an efficient methodology which permits the modeling of parallel activities and synchronization points systems. This methodology is expressed by SAN. SAN modeling is studied under Markovian assumptions. ESA

The implementation of PROLOG on distributed memory architectures is investigated. The OPERA model is presented. It uses OR parallelism to distribute dynamical program evaluation on several nodes of a network of processing elements. The OPERA system is multisequential: parallelization occurs only when a processor become idle. The system is composed of an operative part which computes PROLOG program and a control part which allocates jobs to workers. The choice of a memory representation for the OR tree, the management of multiple binding and control on branch allocation to abstract machines are difficult tasks. The load balancing strategy is based on heuristics. The scheduler works on an approximate global state obtained by sampling worker's local states. An OPERA prototype was implemented on Supernode, a dynamically reconfigurable transputer network. Dynamic configuration is used to reduce communication overhead. Communications are performed in parallel with computation. The prototype provides good speedups and OPERA is one of the most efficient existing parallel PROLOG systems. ESA

TOWARDS THE FORMAL SPECIFICATION OF THE REQUIREMENTS AND DESIGN OF A PROCESSOR INTERFACE UNIT: HOL LISTINGS
David A. Fura, Phillip J. Windley (Idaho Univ., Moscow.), and Gerald C. Cohen Nov. 1993 247 p
(Contract NAS1-18586; RTOP 505-64-10-07)
(NASA-CR-191465; NAS 1.26:191465) Avail: CASI HC A11/MF A03

This technical report contains the HOL listings of the specification of the design and major portions of the requirements for a commercially developed processor interface unit (or PIU). The PIU is an interface chip performing memory interface, bus interface, and additional support services for a commercial microprocessor within a fault-tolerant computer system. This system, the Fault-Tolerant Embedded Processor (FTEP), is targeted towards applications in avionics and space requiring extremely high levels of mission reliability, extended maintenance-free operation, or both. This report contains the actual HOL listings of the PIU specification as it currently exists. Section two of this report contains general-purpose HOL theories that support the PIU specification. These theories include definitions for the hardware components used in the PIU, our implementation of bit words, and our implementation of temporal logic. Section three contains the HOL listings for the PIU design specification. Aside from the PIU internal bus (I-Bus), this specification is complete. Section four contains the HOL listings for a major portion of the PIU requirements specification. Specifically, it contains most of the definition for the PIU behavior associated with memory accesses initiated by the local processor. Derived from text

This report has been prepared to supplement a forthcoming chapter on formal methods in the FAA Digital Systems Validation Handbook. Its purpose is as follows: to outline the technical basis for formal methods in computer science; to explain the use of formal methods in the specification and verification of software and hardware requirements, designs, and implementations; to identify the benefits, weaknesses, and difficulties in applying these methods to digital systems used on board aircraft; and to suggest factors for consideration when formal methods are offered in support of certification. These latter factors assume the context for software development and assurance described in RTCA document DO-178B, 'Software Considerations in Airborne Systems and Equipment Certification,' Dec. 1992. A LOWER BOUND FOR ROUTING ON A COMPLETELY CONNECTED OPTICAL COMMUNICATION PARALLEL COMPUTER
L. A. Goldberg, M. Jerrum (Edinburgh Univ., Scotland.), and P. D. MacKenzie (Texas Univ., Austin.) 3 Aug. 1993 19 p Presented at the Symposium on Discrete Algorithms, Arlington, VA, 23-26 Jan. 1994
(Contract DE-AC04-76DP-00789)
(DE93-040752; SAND-93-1866C; CONF-940130-1) Avail: CASI HC A03/MF A01

The task of routing a 2-relation on an n-processor completely connected optical communication parallel computer (OCPC) is considered. A lower bound is presented that applies to any randomized distributed algorithm for this task: specifically, it is shown that the expected number of steps required to route a 2-relation is (Omega)((radical) log log n) in the worst case. For comparison, the best upper bound known is O(log log n). DOE

EXTENDING SUBSTRUCTURE BASED ITERATIVE SOLVERS TO MULTIPLE LOAD AND REPEATED ANALYSES Progress Report No. 3
Charbel Farhat Aug. 1993 25 p
(Grants NAG2-827; NSF ASC-92-17394)
(NASA-CR-194822; NAS 1.26:194822) Avail: CASI HC A03/MF A01

Direct solvers currently dominate commercial finite element structural software, but do not scale well in the fine granularity regime targeted by emerging parallel processors. Substructure based iterative solvers--often called also domain decomposition algorithms--lend themselves better to parallel processing, but must overcome several obstacles before earning their place in general purpose structural analysis programs. One such obstacle is the solution of systems with many or repeated right hand sides. Such systems arise, for example, in multiple load static analyses and in implicit linear dynamics computations. Direct solvers are well-suited for these problems because after the system matrix has been factored, the multiple or repeated solutions can be obtained through relatively inexpensive forward and backward substitutions. On the other hand, iterative solvers in general are ill-suited for these problems because they often must restart from scratch for every different right hand side. In this paper, we present a methodology for extending the range of applications of domain decomposition methods to problems with multiple or repeated right hand sides. Basically, we formulate the overall problem as a series of minimization problems over K-orthogonal and supplementary subspaces, and tailor the preconditioned conjugate gradient algorithm to solve them efficiently. The resulting solution method is scalable, whereas direct factorization schemes and forward and backward substitution algorithms are not. We illustrate the proposed methodology with the solution of static and dynamic structural problems, and highlight its potential to outperform forward and backward substitutions on parallel computers. As an example, we show that for a linear structural dynamics problem with 11640 degrees of freedom, every time-step beyond time-step 15 is solved in a single iteration and consumes 1.0 second on a 32 processor iPSC-860 system; for the same problem and the same parallel processor, a pair of forward/backward substitutions at each step consumes 15.0 seconds. ARC CONSISTENCY PROBLEM: AN EXERCISE IN PARALLEL PROGRAMMING WITH SHARED OBJECTS
I. Athanasiu (Bucharest Polytechnic Inst., Romania.) and H. E. Bal Jul. 1993 19 p See also PB94-110574 Prepared in cooperation with Bucharest Polytechnic Inst., Romania
(PB94-110590; IR-331) Avail: CASI HC A03/MF A01

The authors consider a new model for parallel programming of distributed computing systems. This model allows processes on different machines of a network to communicate through shared objects. The paper describes their experiences in using this model for implementing the Arc Consistency Problem (ACP). ACP algorithms can be used as an initial step in solving the Constraint Satisfaction Problem, a fundamental artificial intelligence (AI) problem. They have used this application as a case study for distributed programming with shared data-objects. The shared data-object model provides logically shared data to the programmer, rather than message passing. The model is the basis of the Orca programming language. NTIS

DESIGN AND IMPLEMENTATION ISSUES OF END-TO-END PROTOCOLS IN HIGH-SPEED NETWORKS
A. L. Olah and S. M. HeemstradeGroot 1993 25 p
(PB94-110905; TIOS-93/24) Copyright Avail: CASI HC A03/MF A01

Optical transmission technology opens the way to design computer networks which offer bandwidth in the order of Gigabits/s to individual computers. Backed by the improvements of microprocessor technology, there are numerous applications that are ready to exploit the advantages of high-speed networks. The effects of this new networking environment on the design and implementation of communication protocols has become the subject of extensive research. The paper focuses on issues related to the design and implementation of end-to-end protocols because the upper layer protocols are identified by many researchers as a possible bottleneck in high-speed communication. A survey of the literature concerning the problem is given. NTIS

PREEMPTIVE SCHEDULING IN A TWO-STAGE MULTIPROCESSOR FLOW SHOP IS Np-HARD
J. A. Hoogeveen, J. K. Lenstra, and B. Veltman Jul. 1993 10 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-111648; MEMO-COSOR-93-20) Avail: Issuing Activity (National Technical Information Service (NTIS))

An efficient algorithm for minimizing makespan in a two-machine flow shop was previously given; there is no advantage to preemption in this case. A wrap-around rule finds a shortest preemptive schedule on identical parallel machines in linear time. A similarly efficient algorithm is unlikely to exist for the simplest common generalization of these problems. The authors show that preemptive scheduling in a two-stage flow shop, with at leasttwo identical parallel machines in one of the stages so as to minimize makespan, is NP-hard in the strong sense. A set of unit-time tasks has to be processed on identical parallel processors subject to precedence constraints and unit-time communication delays; does there exist a schedule of maximum length, d? The problem has two variants, depending on whether the number of processors is restrictively small or not. For the first variant, the question can be answered in polynomial time for $d = 3$ and is NP-complete for $d = 4$. The second variant is solvable in polynomial time for $d = 5$ and NP-complete for $d = 6$. As a consequence, neither of the corresponding optimization problems has a polynomial approximation scheme, unless $P = NP$. NTIS

(NASA-CR-4522; NAS 1.26:4522) Avail: CASI HC A04/MF A01

The formal verification of the design and partial requirements for a Processor Interface Unit (PIU) using the Higher Order Logic (HOL) theorem-proving system is described. The processor interface unit is a single-chip subsystem within a fault-tolerant embedded system under development within the Boeing Defense and Space Group. It provides the opportunity to investigate the specification and verification of a real-world subsystem within a commercially-developed fault-tolerant computer. An overview of the PIU verification effort is given. The actual HOL listing from the verification effort are documented in a companion NASA contractor report entitled 'Towards the Formal Verification of the Requirements and Design of a Processor Interface Unit - HOL Listings' including the general-purpose HOL theories and definitions that support the PIU verification as well as tactics used in the proofs. TOWARDS THE FORMAL SPECIFICATION OF THE REQUIREMENTS AND DESIGN OF A PROCESSOR INTERFACE UNIT
David A. Fura, Phillip J. Windley (Idaho Univ., Moscow.), and Gerald C. Cohen Dec. 1993 90 p
(Contract NAS1-18586; RTOP 505-64-10-07)
(NASA-CR-4521; NAS 1.26:4521) Avail: CASI HC A05/MF A01

Work to formally specify the requirements and design of a Processor Interface Unit (PIU), a single-chip subsystem providing memory interface, bus interface, and additional support services for a commercial microprocessor within a fault-tolerant computer system, is described. This system, the Fault-Tolerant Embedded Processor (FTEP), is targeted towards applications in avionics and space requiring extremely high levels of mission reliability, extended maintenance free operation, or both. The approaches that were developed for modeling the PIU requirements and for composition of the PIU subcomponents at high levels of abstraction are described. These approaches were used to specify and verify a nontrivial subset of the PIU behavior. The PIU specification in Higher Order Logic (HOL) is documented in a companion NASA contractor report entitled 'Towards the Formal Specification of the Requirements and Design of a Processor Interfacs Unit - HOL Listings.' The subsequent verification approach and HOL listings are documented in NASA contractor report entitled 'Towards the Formal Verification of the Requirements and Design of a Processor Interface Unit' and NASA contractor report entitled 'Towards the Formal Verification of the Requirements and Design of a Processor Interface Unit - HOL Listings.' OPTIMIZING PARALLELIZATION
Greg Morrisett and Maurice Herlihy Oct. 1993 15 p Sponsored by NSF
(AD-A273565; CMU-CS-93-171) Avail: CASI HC A03/MF A01

To transform a sequential program into a concurrent program, a compiler typically divides the sequential program into a partially-ordered set of basic blocks, allowing unrelated blocks to execute concurrently. Blocks may execute concurrently only if there are no dependencies among them, and therefore a compiler can introduce concurrency only to the extent that it can guarantee the absence of dependencies. A limitation of this technique is that it is necessarily conservative: it may be difficult or impossible to prove the absence of dependencies even when no dependencies exist. This paper investigates optimistic parallelization, a complementary technique for parallelizing sequential code. Blocks with potential conflicts are allowed to execute in parallel, and conflicts are detected at run-time. When a conflict is detected, the conflicting blocks are rolled back and re-executed in sequential order. Optimistic parallelization can enhance concurrency when the compiler cannot prove the absence of dependence among independent blocks, and when dependencies occur, but are sufficiently rare. We show how conflict detection and roll-back can be accomplished efficiently through relatively simple changes to the caches and the cache-coherence protocol of a shared-memory multiprocessor. DTIC

SENSITIVITY ANALYSIS OF LIST SCHEDULING HEURISTICS
A. W. J. Kolen, A. H. G. RinnooyKan, C. P. M. VanHoesel, and A. P. M. Wagelmans Mar. 1993 27 p Prepared in cooperation with Erasmus Univ., Rotterdam, Netherlands and Limburg Univ. Maastricht, Netherlands Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-237766; MEMO-COSOR-93-10) Avail: Issuing Activity (National Technical Information Service (NTIS))

When jobs have to be processed on a set of identical parallel machines so as to minimize the makespan of the schedule, list scheduling rules form a popular class of heuristics. When all processing times are exactly known, a given list scheduling rule will generate a unique assignment of jobs to machines. However, when there exists a priori uncertainty with respect to one of the processing times, then there will be, in general, several possibilities for the assignment that will be generated once that processing time is known. That number of possible assignments may be viewed as a measure of the sensitivity of the list scheduling rule that is applied. Bounds on the maximum number of possible assignments for several list scheduling heuristics are derived, and the makespan associated with these assignments was also studied. In this way it obtains analytical support for the intuitively plausible notion that the sensitivity of a list scheduling rule increases with the quality of the schedule produced. NTIS

HIGH-LEVEL CONNECTIONIST MODELS Final Report
Jordan B. Pollack Oct. 1993 45 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-93-1-0059)
(AD-A273638; OSURF-760388; OSURF-726944) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

Our goals this year involved learning in connectionist networks while automatically decomposing behaviors in order to support those behaviors with modular architectures. While there has been some work in this area, we desired to have the modules fully evolve in response to the demands of the task. To accomplish this, we needed a training mechanism more robust than backpropagation, so we turned towards genetic algorithms (GAs). These algorithms, based on principles adopted from natural selection, allow solutions to be evolved which fit the requirements of an environment. There is an extensive body of work applying GAs to evolving neural networks, but most simply use GAs to set the weights for a fixed-structure network. DTIC

THE DESIGN OF THE EMPS MULTIPROCESSOR EXECUTIVE FOR DISTRIBUTED COMPUTING Ph.D. Thesis
Gerardus Johannes W. vanDijk 1993 164 p
(ETN-94-95336) Avail: CASI HC A08/MF A02

The design of the Eindhoven Multi Processor System (EMPS) executive for distributed computing is described. Research is concentrated on the hardware architecture, the software architecture, interprocess communication, and process migration. The motivations that led to certain choices in the design of the hardware architecture for the EMPS multiprocessor executive are given. The different modules that can be used to construct an EMPS hardware configuration are summarized. The design of the software architecture of the EMPS multiprocessor executive is presented. The implementation of interprocess communication via mailboxes is described using the object oriented paradigm. The EMPS kernel supports location transparent communication between application processes, which is required for process migration. The design and implementation of the process migration facility in the EMPS system is described. The performance of the process migration facility is compared to process migration facilities in other distributed systems. ESA

MULTIPROCESSOR SCHEDULING WITH COMMUNICATION DELAYS Ph.D. Thesis
Bart Veltman 1993 127 p Prepared in cooperation with Center for Mathematics and Computer Science, Amsterdam, Netherlands
(ETN-94-95346) Avail: CASI HC A07/MF A02

It is important, when programming a parallel computer, to assign the tasks to processors while respecting the information dependencies inbetween the tasks. The purpose of the work is to investigate the allocation of program modules or tasks to parallel processors in the context of deterministic machine scheduling theory. An extension of an already applied scheduling model is proposed. A model allowing for communication delays is discussed. The tradeoff between the optimal makespan of schedules with and without duplicated tasks is investigated. The computational complexity of scheduling multiprocessor tasks with prespecified processor allocations is studied. The hybrid invariant, in which some tasks are to be allocated to either of two processors and others have a prespecified allocation to a single processor, is considered. A detailed description of Tosca's method and its implementation are given. ESA

N94-25226 Technische Univ., Eindhoven (Netherlands).
MODELS OF TRACE THEORY SYSTEMS Ph.D. Thesis
Joanna Maria vandeMortel-Fronczak 1993 211 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-94-95361) Avail: CASI HC A10

A formalism for reasoning about parallel system using the partial order approach is presented. The systems considered are described in terms of trace theory. The part of trace theory that forms the background for the study is presented. This includes basic concepts and notions, followed by several useful results. Properties of processes and systems concerned with disabling and divergence are discussed. The failures model of systems is defined. An operational view of systems is given. In this approach, concurrency is not modeled by interleaving. Concepts used for defining the testing relations are introduced. Some properties of the testing relations are proved. Specifically, parallel composition and projection are monotonic with respect to the implementation relation (sat), and the equivalence relation induced by sat is a congruence with respect to parallel composition and to projection. Comparing systems in this setting involves calculations on a large domain of tests. An abstract model for comparing systems is proposed. This model is compositional with respect to the parallel composition operator and to the projection operator. The abstract model is used to define a semantics of a subset of Tangram programs. Incorporating fairness assumptions into the abstract model of systems is considered. The Alternating Bit Protocol is discussed. ESA

N94-25278# Technische Univ., Eindhoven (Netherlands).
DESIGNING PARALLEL PROGRAMS OF PARAMETERIZED GRANULARITY Ph.D. Thesis
Pieter Struik 1992 96 p Sponsored by Philips Gloeilampenfabrieken N.V., Eindhoven, Netherlands
(ETN-94-95302) Avail: CASI HC A05/MF A01

A method for designing fine grained programs is discussed. The design method is explained by identifying five phases in the design of a parallel program. Each phase is addressed separately. A design decision made in one phase usually has impact on some next design phases. Two programs that serve as running examples throughout are derived. The implementation of parallel programs on processor networks is considered. A model to analyze an implementation's speedup is presented. A technique for transforming fine grained programs into programs of a coarser grain is discussed. This technique yields programs of parameterized granularity. The proposed technique is applied to two types of programs. The running examples are transformed into parallel programs of parameterized grain size. It is shown that the transformation technique is generally applicable to any fine grained program. Experimental results for both very large scale integration and processor network implementations of the running examples are presented. ESA

A DESIGN METHOD FOR PARALLEL PROGRAMS Ph.D. Thesis

Ludovicus Daniel Jos Loyens 1992 125 p Prepared in cooperation with Philips Gloeilampenfabrieken N.V., Eindhoven, Netherlands
(ETN-94-95331) Avail: CASI HC A06/MF A02

The purpose of the work is to give basic guidelines to master the complexity of parallel programs. A parallel programming method is built. Several aspects of parallel programs are discussed. The skeleton of the design method, based on the use of parameterized invariants and on the knowledge of sequential programming, is presented. A derivation of a parallel program and examples are given. Simple distributions of arrays and matrices together with two examples of making new distributions are studied. The properties of distributions are discussed in order to obtain a better understanding of their role in parallel programs. The proposed parallel programming techniques are applied to a class of segment problems. A parallel program for the solution of a special class of symmetric system is derived. A space parallel Cholesky factorization program is obtained. The resulting algorithms can be used as building blocks for many algorithms that need the solution of a sparse symmetric positive definite system. Timing results for the parallel programs are also given. ESA

EXPERT SYSTEM RULE-BASE EVALUATION USING REAL-TIME PARALLEL PROCESSING Final Report, 1 Jun. - 1 Aug. 1993

James L. Noyes Sep. 1993 35 p
(AD-A273701; WL-TR-93-3098) Avail: CASI HC A03/MF A01

A large rule-based expert system with each rule involving perhaps 10 out of 100,000 possible Boolean criteria, can require a significant amount of processing time to evaluate. This time can be reduced if all rules have a single consequent and have antecedents that contain only conjunctions of the Boolean criteria or their complements. If the consequences do not insert new facts into the rule-base, then parallel processing can be used with great efficiency. The value of a rule-based expert system to help solve a variety of diagnostic and advisory needs has been well-demonstrated over the last 2 decades. Parallel processing has become increasingly important for embedded systems in order to accelerate a variety of computations. This report discusses research connected to the development of a data structure and algorithm to perform parallel inferencing in rule-based systems. It also discusses a simulation technique for estimating the number of processors needed to evaluate a given number of rules and criteria within the required time. DTIC

DECOUPLING PROBLEMS AROUND A TRAJECTORY: FROM LINEARITY TO NONLINEARITY

A. C. Ruiz and H. Nijmeijer Feb. 1993 26 p Sponsored by CONACyT, Mexico
(MEMO-1115; ETN-94-94751) Avail: CASI HC A03/MF A01

Given a nonlinear control system for which an admissible state trajectory is specified, the input output decoupling problem around this nominal trajectory is solved approximately. An approximate solution for this problem is obtained by dealing with the linearized system along this trajectory. An exact solution to the input output decoupling problem for the linearization is shown to be an approximate solution to the input output decoupling problem around the nominal trajectory for the original nonlinear system. In a similar way, an approximate solution to the disturbance decoupling problem around a specified trajectory of the nonlinear system is provided. The nonlinear model of a two link robot manipulator is used to illustrate the results on input output decoupling. ESA

BALANCING FOR UNSTABLE NONLINEAR SYSTEMS

J. M. A. Scherpen 23 Feb. 1993 22 p Sponsored by Dutch Systems and Control Theory Network
(MEMO-1118; ETN-94-94753) Avail: CASI HC A03/MF A01

A previously obtained method of balancing for stable nonlinear systems is extended to unstable nonlinear systems. The similarity invariants obtained by the concept of LQG balancing for an unstable linear system can also be obtained by considering a past and future energy function of the system. By considering a past and future energy function for an unstable nonlinear system, the concept of these similarity invariants for linear systems is extended to nonlinear systems. Furthermore the relation of this balancing method with the previously obtained method of balancing the coprime factorization of an unstable nonlinear system is considered. Both methods are introduced with the aim of using them as a tool for model reduction. ESA

NONLINEAR STATE SPACE H(SUB INFINITY) CONTROL THEORY

A. J. vanderSchaft Feb. 1993 41 p
(MEMO-1119; ETN-94-94754) Avail: CASI HC A03/MF A01

A concise treatment of L(sub 2) gain analysis of nonlinear systems is presented and the state feedback H-infinity suboptimal control problem is addressed. A result concerning robustness of H-infinity suboptimal state feedbacks is derived. The necessary conditions for the full (dynamic output feedback) H-infinity control problem are surveyed, including the derivation of a generalized version of a separation principle. The main novelty is in the derivation of the nonlinear central controller, which in general is an infinite dimensional system. An explicit solution to the H-infinity optimal control problem for nonlinear lossless systems is discussed. ESA

N94-22707# Universiteit Twente, Enschede (Netherlands). Systems and Control Group.

NONLINEAR SYSTEMS WHICH HAVE FINITE-DIMENSIONAL H(SUB INFINITY) SUBOPTIMAL CENTRAL CONTROLLERS

A. J. vanderSchaft Feb. 1993 8 p
(MEMO-1120; ETN-94-94755) Avail: CASI HC A02/MF A01

Following up the work of Basar and Bernhard, the nonlinear central controller solving the nonlinear (standard) H-infinity suboptimal control problem was recently derived. This nonlinear central controller is an infinite dimensional system, and the situation is very much like in nonlinear stochastic filtering or nonlinear deterministic filtering. In the linear case the nonlinear central controller is shown to reduce to the finite dimensional central controller of Doyle, Glover, Khargonekar and Francis, and consideration is given to whether there are truly nonlinear systems having finite dimensional central controllers. Guided by similar considerations in nonlinear stochastic and deterministic filtering, a specific class of nonlinear systems having finite dimensional central controllers is characterized. This class can be regarded as the deterministic H-infinity analog of the class of nonlinear systems admitting finite dimensional filters as identified by Benes. ESA

NORMAL FORMS OF KINEMATIC SINGULARITIES OF 3R ROBOT MANIPULATORS

Krzysztof Tchon (Technical Univ. of Wroclaw, Poland.) Mar. 1993 23 p
(MEMO-1124; ETN-94-94760) Avail: CASI HC A03/MF A01

Using the singularity theory approach, kinematic singularities of 3R robot manipulators satisfying certain geometric conditions are studied. A classification of singular configurations is given and three mathematical models (normal forms) of the kinematics around singular configurations are derived. ESA

N94-22714# Universiteit Twente, Enschede (Netherlands). Faculty of Applied Mathematics.
FEEDBACK LINEARIZATION OF PARAMETRIZED NONLINEAR TIME-VARYING SYSTEMS
H. Nijmeijer and G. Campion (Universite Catholique de Louvain, Belgium.) Mar. 1993 10 p
(MEMO-1126; ETN-94-94762) Avail: CASI HC A02/MF A01

The feedback linearization of a parametrized nonlinear system, which is not necessarily linear in the parameters, is studied. This in particular includes a result on linearization of a time varying nonlinear system, in the case where the parameters are time varying. A necessary and sufficient condition for feedback linearization, depending on the time evolution of the parameters, and a structural sufficient condition independent of the parameters evolution, are derived. For the case of a linearly parametrized system, this sufficient condition is shown to be equivalent to one of the matching conditions. ESA

IDENTIFICATION FOR ROBUST CONTROL USING AN H(SUB INFINITY) NORM
T. J. J. vandenBoom, A. A. H. Damen, and Martin Klompstra Jul. 1992 44 p
(EUT-92-E-261; ISBN-9-06-144261-3; ETN-94-94768) Avail: CASI HC A03/MF A01

An identification method using H(sub infinity) norm which yields a nominal model and information about the model uncertainties applicable to H(sub infinity) robust control design is presented. Disturbances and noise signals at the input and output of the system are characterized as norm-bounded. The first step in the identification method is to compute uncertainty regions for the process dynamics on the complex plane. The a priori knowledge about the norm bounds on the disturbances and properties of conformal mappings are used to compute these regions. The second step is to find a model in a model set that minimizes the H(sub infinity) norm of the model errors, given the uncertainty regions. An elementary implementation of the method is presented with two simulation studies. ESA

THE ADAPTIVE RESONANCE THEORY NETWORK: (CLUSTERING-) BEHAVIOUR IN RELATION WITH BRAINSTEM AUDITORY EVOKED POTENTIAL PATTERNS M.S. Thesis
L. W. Freriks, P. J. M. Cluitmans, and M. J. vanGils Nov. 1992 105 p
(EUT-92-E-264; ISBN-9-06-144264-8; ETN-94-94771) Avail: CASI HC A06/MF A02

A discussion on neural networks and pattern recognition is presented and a study of the adaptive resonance theory (ART) network in relation with a pattern recognition problem, extraction of features from auditory evoked potential (AEP) patterns, is described. The automatic extraction of features from AEP is desired in a medical engineering servo anesthesia project, because there is possible correlation between AEP patterns and variations in 'anesthetic depth.' From a literature search, three networks were concluded to be possible tools for solving the AEP problem: the multilayer perceptron, the counter propagation network, and the ART network. ART one, which handles binary valued input patterns, and ART two, which handles analog input patterns, are addressed. The last network was used to solve the pattern recognition problem. Investigations to find an algorithm for this network are described. The AEP problem was not solved but the criterion to which ART two clusters AEP patterns is shown to be very clear. Due to this criterion it is expected that it will not be easy to solve the AEP pattern recognition problem with an ART two network. ESA

ARTIFICIAL NEURAL NETWORKS: APPLICATION TO THE OPTICAL RECOGNITION OF MUSIC PARTITIONS Ph.D. Thesis [RESEAUX DE NEURONES ARTIFICIELS: APPLICATION A LA RECONNAISSANCE OPTIQUE DE PARTITIONS MUSICALES]
Philippe Martin 1992 184 p In FRENCH
(ETN-94-95166) Avail: CASI HC A09/MF A02

The development and use of artificial neural networks to solve an unusual pattern recognition problem, those of optical musical score recognition, are discussed. A bibliographical study of the main connectionist models, the most frequently used in the pattern recognition field, is presented. Different techniques which are useful to design a multilayer architecture and train it with the known gradient backpropagation learning algorithm are reviewed. The special case of threshold automata networks is studied. Their properties and links with conventional classification techniques are enhanced. A new hierarchical learning scheme for these networks is proposed. A low level image analysis system for engraved musical scores is described. Several solutions for preprocessing, segmentation, and classification are proposed. These solutions involve both classical image analysis techniques and connectionist methods. Experimental results are presented. ESA

MOTION PLANNING FOR A NON-HOLONOMIC MOBILE IN A DYNAMIC WORKSPACE Ph.D. Thesis [PLANIFICATION DE MOUVEMENT POUR MOBILE NON-HOLONOME EN ESPACE DE TRAVAIL DYNAMIQUE]
Thierry Fraichard 1992 91 p In FRENCH
(ETN-94-95180) Avail: CASI HC A05/MF A01

Motion planning for a mobile A which is subject to kinematic and dynamic constraints and moves within a dynamic workspace W is investigated. This problem can be solved efficiently if W is naturally structured for A, that is, if it is possible to define a set of free regions within which A is able to move. In this case the problem considered can be tackled along two complementary directions: path planning which takes into account the fixed obstacles of W and the kinematic constraints of A; and trajectory planning which takes into account the moving obstacles of W and the dynamic constraints of A. A car-like mobile in the road network is considered. The free regions are defined by the lanes of the roadway. A is subject to a non holonomic kinematic constraint which compels it to move in a direction which is perpendicular to the axle of its wheels. The gyration radius and the acceleration and the velocity of A are bounded. Two techniques to solve the planning problems are presented. How to integrate these two techniques within a motion planner which is able to efficiently solve the problem considered is shown. ESA

CONTRIBUTION TO GEOMETRIC AND DYNAMIC MODELING OF PARALLEL ROBOTS Ph.D. Thesis - Toulouse Univ. [CONTRIBUTION A LA MODELISATION GEOMETRIQUE ET DYNAMIQUE DES ROBOTS PARALLELES]
Mourad Ait-Ahmed 1993 132 p In FRENCH
(LAAS-93089; ETN-94-95186) Avail: CASI HC A07/MF A02

The geometric and dynamic modeling of parallel robots are investigated. The kinematic chains are considered from a topologic and geometric viewpoint so as to ascertain their degree of mobility. The geometric description of these chains is discussed. In all cases, the method proposed allows use of one frame only per link and a maximum of five parameters to define the situation of a link relative to its neighbor. In fact this number reduces to four in the case of a simple kinematic chain structure. The parallel robots most often used in the literature are presented together with methods of modeling involved. The direct geometric modeling of a parallel robot is analyzed by two methods: iterative, based on the computation of a jacobian; and analytical, reducing to the computation of the roots of a polynomial equation. A method for the computation of the dynamic model of mechanisms with a closed chain structure is proposed. This dynamic model is computed as a function of its minimum equivalent tree mechanism. The constraint equations due to the closing of mechanical loops are taken into account. ESA

AN ARCHITECTURE FOR TELEPROGRAMMING AUTONOMOUS MOBILE ROBOTS AT TASK LEVEL Ph.D. Thesis - Toulouse Univ. [UNE ARCHITECTURE POUR LA TELEPROGRAMMATION AU NIVEAU TACHE D'UN ROBOT MOBILE AUTONOME]
Bernard Degallaix 1993 173 p In FRENCH Sponsored by IFREMER, France
(LAAS-93107; ETN-94-95188) Avail: CASI HC A08/MF A02

The class of intervention mobile robots that have to perform tasks in unknown environments, which are often remote or involve difficult or dangerous access, are investigated. Underwater robotics projects, a Mars rover for planet exploration, or intervention robots for public safety applications are usual examples. Efficient task programming and constant adaptation to the environment by the robot are required for remote applications when limited bandwith and substantial communication delays make it impossible to perform tasks via classical teleoperation. This class of problems demands a specific decisional architecture which couples 'intelligence' at the programming level with 'intelligence' at the level of the physical machine. This second requirement implies that the machine exhibits the attributes of an autonomous intelligent robot. A generic architecture to achieve task control of a remote intervention robot is developed. It is composed of an operator station and the onboard robot control system. Given a set of goals to be achieved, the operator station plans and refines the mission, taking into account temporal constraints. The robot control system is autonomous at the task level. The task assignments are transformed into sequences of actions using its own interpretation and planning capacities. These actions are processed while the system remains reactive to events and environment. ESA

INTERPRETATION OF EVOLUTIVE ENVIRONMENT BY A MULTISENSORY PERCEPTION MACHINE Ph.D. Thesis - Toulouse Univ. [INTERPRETATION D'ENVIRONNEMENT EVOLUTIF PAR UNE MACHINE DE PERCEPTION MULTI-SENSORIELLE]

Jean-Philippe Thibault 1993 173 p In FRENCH
(LAAS-93111; ETN-94-95189) Avail: CASI HC A08/MF A02

A multisensory perception machine is a system that continuously receives and actively gathers information on its environment. A consistent interpretation of the environment evolution is kept. The work is focused on a perception machine in a structured environment with knowledge about its features and models of its objects. Interpretations rest on data fusion both at the level of numerical information and at the level of hypotheses on partial interpretations. The perception is active in the sense that the perception machine has means to move and to adjust functioning modalities of the sensors in order to gather missing information. The management of sensory hypotheses, with the hypothetical reasoning from these hypotheses to constitute an interpretation, and with the execution control of the interpretation process and the resources devoted to it, is investigated. The state of the art of reason maintenance systems is surveyed. A system implemented and used in the multisensory perception machine is presented. The interpretation of the environment in the perception machine is analyzed. How the reliable interpretations are built from perceived sensory data is shown. The control system and the control results from compiling specifications of perceptual tasks are presented. ESA

PERCEPTION AND 3D ENVIRONMENT MODELING FOR MOBILE ROBOT AUTONOMOUS NAVIGATION Ph.D. Thesis - Toulouse Univ. [PERCEPTION ET MODELISATION D'UN ENVIRONNEMENT TRIDIMENSIONNEL POUR LA NAVIGATION AUTONOME D'UN ROBOT MOBILE]

Fawzi Nashashibi 1993 181 p In FRENCH
(LAAS-93117; ETN-94-95190) Avail: CASI HC A09/MF A02

Autonomous mobile robots are designed to perform intelligent modeling of the world and to build internally descriptive representations of encountered terrain. The choice of the representation depends on the sensor, the terrain's topography, and on the nature of the required mission. Range sensory data is considered. The study of the laser range finders used, the modeling of their performances, and the problem of their intrinsic and extrinsic calibrations are discussed. Two different approaches to deal with terrain modeling are proposed. The first model is called the digital terrain model. The second model is called the three dimensional polyhedral model. The approach to build digital navigation maps is described. Incremental modeling, terrain maps fusion, and robot position estimation are considered. The relocation/fusion paradigm is reviewed when handling the modeling of indoor scene structured environments. The perception subsystem and low level modeling procedures are described. The robot localization is studied. The fusion of snapshot models into a global three dimensional polyhedral model is performed. A terrain analysis and an interpretation phase are studied. Three dimensional feature extraction from the global model and the problem of maintaining its global coherence are described. The approach to build a hybrid three dimensional model combining the digital terrain model and the three dimensional polyhedral model is summarized. ESA

This paper describes our work to produce 'smart' equipment using a neural network to provide intelligence for process monitoring, adaptive control, metrology, and equipment diagnostics. This novel system will improve both quality and yield for critical thin films used in semiconductors, superconductors, high-density magnetic and optical storage, and advanced displays, all of which are critical to maintaining our leadership in the multibillion-dollar electronic and computer industries. The equipment will have on-line, real-time diagnostics capabilities to detect component problems early in order to minimize maintenance and downtime. DOE

(ETN-94-95175) Avail: CASI HC A07

Techniques for accelerating computation times are investigated. The neural network data processing acceleration can be performed by applying either parallel machines, dedicated processors, or parallelism and coprocessors. Several neuro-computing algorithms are reviewed. A partitioning method is developed and applied to the vector matrix iterated product in order to reduce the whole communication volume. The parallelization of neurocomputing model on a distributed multiprocessor machine is discussed. Algorithms and neuro-computing processors related to coprocessor implantations are studied. Application examples on L-neuro coprocessors are given. A European project involving the development of a general purpose neuro-computer and a silicon compiler is summarized. The implantation of parallel and pipeline modes of low level virtual machine language is included. ESA

REDUCED-ORDER MODELLING AND CONTROL OF A CLASS OF SYSTEMS FOR WHICH BALANCED TRUNCATION IS HANKEL-NORM OPTIMAL
Denis Mustafa and Munther A. Dahleh (Massachusetts Inst. of Tech., Cambridge.) 1992 19 p Sponsored in part by Commonwealth Fund Harkness Fellowship, NY
(Contract AF-AFOSR-0276B-89; F33615-90-C-3608; DL-H-418511)
(OUEL-1922/92; ETN-94-95146) Avail: CASI HC A03/MF A01

Various aspects of model and controller reduction are studied for members of a certain class of linear multivariable systems. Such systems can arise as finite difference models of partial differential equations. A number of properties of the balanced approximants are derived explicitly in terms of the original plant poles. For example, it is shown that each balanced approximant is Hankel norm optimal. When the plant is not stable, the closed loop technique of H(sub infinity) balanced truncation is studied as a way of obtaining reduced order controllers. The focus is on the effect of removing unstable poles, which can happen inadvertently. Although the small gain theorem can pre-test for the ability of the reduced order controller to stabilize the full order plant, it is shown that if any unstable poles are truncated then the small gain condition is always violated. In fact, if an unstable pole is removed the resulting reduced order controller is actually destabilizing. ESA

A TRACKING SONAR SENSOR FOR VEHICLE GUIDANCE
James M. Manyika and Hugh F. Durrant-Whyte 1992 29 p
(OUEL-1956/92; ETN-94-95149) Avail: CASI HC A03/MF A01

A sonar sensor capable of fixating on and tracking environment features moving with relative angular velocities up to 0.6 rad/s and linear speeds up to 2.4 m/s is described. The sensor exploits the predominately specular nature of sonar to model target features as Regions of Constant Depth (RCD) characterized by a single range and bearing measurement. To extract these characteristics at high data rates, the sonar uses a monopulse arrangement of single transmitter and spaced receiver pair to provide both range and differential target bearing information. The monopulse arrangement is mounted on a high speed servo which is used to null the monopulse signal and thereby continuously aim the sonar at the center of an RCD. The design, construction, and modeling of this RCD monopulse sonar sensor are described. It is shown that the sensor can provide accurate and reliable relative location information for a platform moving at speed through typical indoor environments. The implementation of an algorithm which uses this information to enable the device to act as a stand alone guidance sensor is described. ESA

GRAPHICAL PROGRAMMING: A SYSTEMS APPROACH FOR TELEROBOTIC SERVICING OF SPACE ASSETS
J. T. Pinkerton (New Mexico Univ., Albuquerque.), M. J. McDonald, R. D. Palmquist, and R. Patten (Oceaneering Space Systems, Webster, TX.) 1993 12 p Presented at the SOAR 1993 Conference, Houston, TX, 3-5 Aug. 1993
(Contract DE-AC04-76DP-00789)
(DE93-019016; SAND-93-1835C; CONF-9308159-1) Avail: CASI HC A03/MF A01

Satellite servicing is in many ways analogous to subsea robotic servicing in the late 1970's. A cost effective, reliable, telerobotic capability had to be demonstrated before the oil companies invested money in deep water robot serviceable production facilities. In the same sense, aeronautic engineers will not design satellites for telerobotic servicing until such a quantifiable capability has been demonstrated. New space servicing systems will be markedly different than existing space robot systems. Past space manipulator systems, including the Space Shuttle's robot arm, have used master/slave technologies with poor fidelity, slow operating speeds and most importantly, in-orbit human operators. In contrast, new systems will be capable of precision operations, conducted at higher rates of speed, and be commanded via ground-control communication links. Challenges presented by this environment include achieving a mandated level of robustness and dependability, radiation hardening, minimum weight and power consumption, and a system which accommodates the inherent communication delay between the ground station and the satellite. There is also a need for a user interface which is easy to use, ensures collision free motions, and is capable of adjusting to an unknown workcell (for repair operations the condition of the satellite may not be known in advance). This paper describes the novel technologies required to deliver such a capability. DOE

VIEWING HYBRID SYSTEMS AS PRODUCTS OF CONTROL SYSTEMS AND AUTOMATA Abstract Only
R. L. Grossman and R. G. Larson Feb. 1992 2 p
(Grants NAG2-513; NSF DMS-91-01089)
(NASA-CR-194792; NAS 1.26:194792) Avail: CASI HC A01/MF A01

The purpose of this note is to show how hybrid systems may be modeled as products of nonlinear control systems and finite state automata. By a hybrid system, we mean a network of consisting of continuous, nonlinear control system connected to discrete, finite state automata. Our point of view is that the automata switches between the control systems, and that this switching is a function of the discrete input symbols or letters that it receives. We show how a nonlinear control system may be viewed as a pair consisting of a bialgebra of operators coding the dynamics, and an algebra of observations coding the state space. We also show that a finite automata has a similar representation. A hybrid system is then modeled by taking suitable products of the bialgebras coding the dynamics and the observation algebras coding the state spaces. Author (revised)

A RELIABLE ALGORITHM FOR OPTIMAL CONTROL SYNTHESIS Final Technical Report, Jan. 1991 - Dec. 1992
Brett VanSteenwyk and Uy-Loi Ly 1992 178 p
(Grant NAG2-691)
(NASA-CR-194809; NAS 1.26:194809) Avail: CASI HC A09/MF A02

In recent years, powerful design tools for linear time-invariant multivariable control systems have been developed based on direct parameter optimization. In this report, an algorithm for reliable optimal control synthesis using parameter optimization is presented. Specifically, a robust numerical algorithm is developed for the evaluation of the H(sup 2)-like cost functional and its gradients with respect to the controller design parameters. The method is specifically designed to handle defective degenerate systems and is based on the well-known Pade series approximation of the matrix exponential. Numerical test problems in control synthesis for simple mechanical systems and for a flexible structure with densely packed modes illustrate positively the reliability of this method when compared to a method based on diagonalization. Several types of cost functions have been considered: a cost function for robust control consisting of a linear combination of quadratic objectives for deterministic and random disturbances, and one representing an upper bound on the quadratic objective for worst case initial conditions. Finally, a framework for multivariable control synthesis has been developed combining the concept of closed-loop transfer recovery with numerical parameter optimization. The procedure enables designers to synthesize not only observer-based controllers but also controllers of arbitrary order and structure. Numerical design solutions rely heavily on the robust algorithm due to the high order of the synthesis model and the presence of near-overlapping modes. The design approach is successfully applied to the design of a high-bandwidth control system for a rotorcraft. Author

EXPERIENCE WITH PARAMETRIC BINARY DISSECTION Final Report

Shahid H. Bokhari (University of Engineering and Technology, Lahore, Pakistan.) Oct. 1993 14 p

(Contract NAS1-19480; RTOP 505-90-52-01)

(NASA-CR-191552; ICASE-IR-25; NAS 1.26:191552) Avail: CASI HC A03/MF A01

Parametric Binary Dissection (PBD) is a new algorithm that can be used for partitioning graphs embedded in 2- or 3-dimensional space. It partitions explicitly on the basis of nodes + (lambda)x(edges cut), where lambda is the ratio of time to communicate over an edge to the time to compute at a node. The new algorithm is faster than the original binary dissection algorithm and attempts to obtain better partitions than the older algorithm, which only takes nodes into account. The performance of parametric dissection with plain binary dissection on 3 large unstructured 3-d meshes obtained from computational fluid dynamics and on 2 random graphs were compared. It was showm that the new algorithm can usually yield partitions that are substantially superior, but that its performance is heavily dependent on the input data. Author (revised)

LOGIC OF CAPABILITIES

W. vanderHoek, B. vanLinder, and J. J. C. Meyer Jul. 1993 50 p

(PB94-110715; IR-330) Avail: CASI HC A03/MF A01

A logic of capabilities is introduced. We start by defining a language L in which not only knowledge and actions of a set of agents can be expressed but also their abilities. To formalize the planning of the agents, a Can-predicate and a Cannot-predicate are used. The former indicates that an agent knows that he can achieve a given goal by performing a given action, the latter indicates that the agent knows that he cannot achieve the given goal by performing the given action. We will define two classes of models, of which one is a restricted version of the other. Using these classes, a semantics for the language L is defined. For the second class of models, a sound and complete axiomatization is given. We define the notion of action transformation, a function that transforms actions into other actions. The semantics that we define is such that two actions that can be transformed into one another have equivalent results and that the abilities of an agent are closed under the action transformations. It turns out that the possibility to express the abilities of an agent provides for a flexible and intuitively appealing framework. NTIS

EPISTEMIC LOGIC FOR DEFEASIBLE REASONING USING A META-LEVEL ARCHITECTURE METAPHOR

J. J. C. Meyer and W. vanderHoek Jul. 1993 29 p See also PB92-198720

(PB94-110723; IR-329) Avail: CASI HC A03/MF A01

The chapter is concerned with default reasoning, or reasoning by default. In particular, we indicate how default logic can be based on epistemic logic, and particularly, how we may employ Halpern and Moses' minimal epistemic states and the entailment relation based on these for this purpose. In this way, we obtain a simple and natural S5-based logic for default reasoning. We discuss these issues in terms of reflective architectures: Halpern and Moses' entailment corresponds to an 'upward reflection', deriving some kind of meta-knowledge that is important for the application of defaults. We discuss some possibilities to deal with the default beliefs that are the outcome of default reasoning, in terms of 'downward reflection', deriving object knowledge from meta-knowledge. This is of particular importance in case the default beliefs contain conflicting information. We also provide one way to resolve possible inconsistencies in the special case of defaults with specificity, even before reflecting down. NTIS

COORDINATE-FREE INTERPRETATIONS OF THE OPTIMAL COSTS FOR Lq PROBLEMS SUBJECT TO IMPLICIT SYSTEMS Research Memo

T. Geerts 1993 54 p Sponsored by Nederlandse Organisatie voor Wetenschappelijk Onderzoek, The Hague

(PB94-118700; FEW-604) Avail: CASI HC A04/MF A01

We consider linear-quadratic control problems with and without stability, subject to an arbitrary implicit continuous-time system, in a simple distributional framework, and it will be shown that the associated optimal costs, if existent, are solutions of our Dissipation Inequality for implicit systems. This concept is related to the Linear Matrix Inequality, which is expressed in original system coefficients only, and the above-mentioned optimal costs turn out to be characterizable uniquely by certain solutions of this inequality. However, these solutions need not be rank minimizing if the underlying system is not standard, and we will specify why this is the case. Our statements are valid for regular as well as for singular problems, and the possible significance of the algebraic Riccati equation will be illustrated for both regular and singular problems. Furthermore, we will present necessary and sufficient conditions for solvability of our problems and for existence of optimal controls and associated optimal state trajectories. Finally, we will elaborate on the uniqueness of these controls and state trajectories. NTIS

MAKING INTELLIGENT SYSTEMS TEAM PLAYERS: ADDITIONAL CASE STUDIES

Jane T. Malin, Debra L. Schreckenghost (Mitre Corp., Houston, TX.), and Ron W. Rhoads (Mitre Corp., Houston, TX.) Dec. 1993 65 p

(NASA-TM-104786; S-752; NAS 1.15:104786) Avail: CASI HC A04/MF A01

Observations from a case study of intelligent systems are reported as part of a multi-year interdisciplinary effort to provide guidance and assistance for designers of intelligent systems and their user interfaces. A series of studies were conducted to investigate issues in designing intelligent fault management systems in aerospace applications for effective human-computer interaction. The results of the initial study are documented in two NASA technical memoranda: TM 104738 Making Intelligent Systems Team Players: Case Studies and Design Issues, Volumes 1 and 2; and TM 104751, Making Intelligent Systems Team Players: Overview for Designers. The objective of this additional study was to broaden the investigation of human-computer interaction design issues beyond the focus on monitoring and fault detection in the initial study. The results of this second study are documented which is intended as a supplement to the original design guidance documents. These results should be of interest to designers of intelligent systems for use in real-time operations, and to researchers in the areas of human-computer interaction and artificial intelligence. DIAGNOSING PROCESS FAULTS USING NEURAL NETWORK MODELS

K. L. Buescher, R. D. Jones, and M. J. Messina 1993 10 p Presented at the Allerton Conference on Communication, Control, and Computing, Urbana, IL, 29 Sep. - 1 Oct. 1993

(Contract W-7405-eng-36)

(DE94-002633; LA-UR-93-3598; CONF-9309272-1) Avail: CASI HC A02/MF A01

In order to be of use for realistic problems, a fault diagnosis method should have the following three features. First, it should apply to nonlinear processes. Second, it should not rely on extensive amounts of data regarding previous faults. Lastly, it should detect faults promptly. The authors present such a scheme for static (i.e., non-dynamic) systems. It involves using a neural network to create an associative memory whose fixed points represent the normal behavior of the system. DOE

COMPOSITIONAL ARCHITECTURE FOR SIMPLE DESIGN FORMALLY SPECIFIED IN DESIRE

Izak VanLangevelde, Albert Philipsen, and Jan Treur Dec. 1992 66 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-119013; IR-318) Avail: Issuing Activity (National Technical Information Service (NTIS))

A simple generic design task is described whereafter a simple scheduling task is described as a specific instance of it. A concise description of DESIRE, a framework for specification of compositional architectures, is presented. It is demonstrated how a generic compositional architecture for simple design can be formally specified by means of DESIRE and how an architecture for simple scheduling can be specified as an instantiation of the generic specification. The reasoning behavior of the resulting architecture is elucidated by reasoning trace. The full specification of the scheduling architecture is included as the appendix. NTIS

SYSTEMATIC CONSTRUCTION OF TRIGONOMETRIC NEURAL NETWORKS

G. M. Megson 1993 26 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-200228; TRS-416) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

A new type of multi-layer neural network based on sets of trigonometric polynomials is introduced. It is shown that the weights of the network can be derived directly from the coefficients of the discrete analog form of the Fourier least squares polynomial for the set generated from the output patterns, and a so-called separator function produced from input patterns of the 'training' set. As a consequence the need for a protracted training period is removed and replaced by a more systematic analysis of output functions. The method is illustrated on a collection of examples. Some general properties and design principles regarding network size and generalization abilities are also considered. NTIS

DISCRETE TIME MINIMUM ENTROPY H(INFINITY) CONTROL PROBLEM

A. A. Stoorvogel and J. H. A. Ludlage (IPCOS B.V., Best, Netherlands.) Mar. 1993 19 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-237808; MEMO-COSOR-93-05) Avail: CASI HC A03

The paper completely solves the discrete time minimum entropy control problem. It is shown that in discrete time, the central controller has the additional interpretation as the controller which minimizes a minimum entropy criterion. This is completely analogous to the continuous time. However, although the H(infinity) control problems for discrete and continuous time can be connected via the bilinear transform, it is shown that this is not the case for the corresponding minimum entropy control problems, and hence, the bilinear transform does not connect the central controllers in continuous and discrete time. PHOTONIC TECHNOLOGY FOR IMPLEMENTATION OF GENERALIZABLE NEURAL NETWORKS: A SYNTHETIC APPROACH Final Report, 30 Sep. 1989 - 15 Sep. 1993

B. K. Jenkins, Anupam Madhukar, and Armand R. Tanguay 28 Oct. 1993 70 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Grant AF-AFOSR-0466-89)
(AD-A273497; AFOSR-93-0878TR) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

This report describes progress and results on the grant, 'Photonic Technology for Implementation of Generalizable Neural Networks: A Synthetic Approach,' DARPA/AFOSR Grant No. AFOSR-89-0466, for the annual reporting period 30 Sep. 1991 - 29 Sep. 1992, and for the final reporting period 30 Sep. 1989 - 15 Sep. 1993. Substantial progress and results have been achieved in the areas of neural network models for optoelectronic systems, photonic neural network architectures, incoherent/coherent holographic interconnections, optical disk spatial light modulators with parallel readout (as input devices), and high bandwidth spatial light modulators (for neuron unit arrays) including mutually compatible silicon detectors, silicon electronics, and high contrast ratio InGaAs/GaAs modulators. ADMITTANCE MODEL FOR THE SHUTTLE REMOTE MANIPULATOR SYSTEM IN FOUR CONFIGURATIONS M.S. Thesis

Loukas Papadopoulos (George Washington Univ., Hampton, VA.) and Robert H. Tolson (George Washington Univ., Hampton, VA.) Nov. 1993 213 p
(Contract NCC1-104; RTOP 586-02-11)
(NASA-CR-4555; NAS 1.26:4555) Avail: CASI HC A10/MF A03

A possible scenario for robot task performance in space is to mount two small, dexterous arms to the end of the Shuttle Remote Manipulator System (SRMS). As these small robots perform tasks, the flexibility of the SRMS may cause unsuccessful task executions. In order to simulate the dynamic coupling between the SRMS and the arms, admittance models of the SRMS in four brakes locked configurations were developed. The admittance model permits calculation of the SRMS end-effector response due to end-effector disturbing forces. The model will then be used in conjunction with a Stewart Platform, a vehicle emulation system. An application of the admittance model was shown by simulating the disturbing forces using two SRMS payloads, the Dextrous Orbital Servicing System (DOSS) manipulator and DOSS carrying a 1000 lb. cylinder. Mode by mode comparisons were conducted to determine the minimum number of modes required in the admittance model while retaining dynamic fidelity. It was determined that for all four SRMS configurations studied, between 4 and 6 modes of the SRMS structure (depending on the excitation loads) were sufficient to retain tolerance of 0.01 inches and 0.01 deg. These tolerances correspond to the DOSS manipulator carrying no object. When the DOSS carries the 1000 lb. cylinder, between 15 and 20 modes were sufficient, approximately three or four times as many modes as for the unloaded case. Author

CONTROLLED INVARIANCE OF NONLINEAR SYSTEMS: NONEXACT FORMS SPEAK LOUDER THAN EXACT FORMS
H. J. C. Huijberts and C. H. Moog Mar. 1993 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-237790; MEMO-COSOR-93-06) Avail: CASI HC A03/MF A01

A general setting is developed which describes controlled invariance for nonlinear control systems and which incorporates the previous approaches dealing with controlled invariant distributions. The main feature of the theory developed is that it is able to clarify the controlled invariance of distributions which are not necessarily integrable. The latter are of major importance for the geometric description of e.g. dynamic feedback problems. NTIS

CONTROL OF NONLINEAR SYSTEMS REPRESENTED IN QUASILINEAR FORM Ph.D. Thesis, 1994 Final Report
Josef A. Coetsee Dec. 1993 204 p
(Grant NAG1-126)
(NASA-CR-194840; NAS 1.26:194840) Copyright Avail: CASI HC A10/MF A03

Methods to synthesize controllers for nonlinear systems are developed by exploiting the fact that under mild differentiability conditions, systems of the form: x-dot = f(x) + G(x)u can be represented in quasilinear form, viz: x-dot = A(x)x + B(x)u. Two classes of control methods are investigated. The first is zero-look-ahead control, where the control input depends only on the current values of A(x) and B(x). For this case the control input is computed by continuously solving a matrix Riccati equation as the system progresses along a trajectory. The second is controllers with look-ahead, where the control input depends on the future behavior of A(x) and B(x). These controllers use the similarity between quasilinear systems and linear time varying systems to find approximate solutions to optimal control type problems. The methods that are developed are not guaranteed to be globally stable. However in simulation studies they were found to be useful alternatives for synthesizing control laws for a general class of nonlinear systems. Author (revised)

GENERICITY OF STABILIZABILITY FOR TIME-DELAY SYSTEMS
L. C. G. J. M. Habets May 1993 40 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-237725; MEMO-COSOR-93-14) Avail: Issuing Activity (National Technical Information Service (NTIS))

Conditions for the stabilizability of time-delay systems with non-commensurate point delays by dynamic state feedback are known in the literature. It is shown that these conditions are satisfied generically. Although an algebraic approach is used to describe the class of all time-delay systems with point delays, the concept of genericity is formulated in a topological framework. In the metric space consisting of all parametrizations of time-delay systems, the subset of all stabilizable systems is an open and dense subset. The proof is given for the commensurate delay case first. At the end it is pointed out that the non-commensurate delay case is not significantly more difficult, and that the same arguments prove also that systems with non-commensurate time-delays are generically stabilizable. OBJECT RECOGNITION THROUGH IMAGE UNDERSTANDING FOR AN AUTONOMOUS MOBILE ROBOT M.S. Thesis
Mark J. DeClue Sep. 1993 195 p
(AD-A273206) Avail: CASI HC A09/MF A03

The problem addressed in this research was to provide a capability for sensing previously unknown rectilinear, polyhedral-shaped objects in the operating environment of the autonomous mobile robot Yamabico-11. The approach to the system design was based on the application of edge extraction and least squares line fitting algorithms of PET92 to real-time camera images with subsequent filtering based on the environmental model of STE92. The output of this processing was employed in the recognition of obstacles and the determination of object range and dimensions. These measurements were then used in path tracking commands, supported by Yamabico's Model-based Mobile Robot Language (MML), for performing smooth, safe obstacle avoidance maneuvers. This work resulted in a system able to localize objects in images taken from the robot, provide location and size data, and cause proper path adjustments. Accuracies on the order of one to ten centimeters in range and one-half to two centimeters in dimensions were achieved. DTIC

DETERMINING NEURAL NETWORK HIDDEN LAYER SIZE USING EVOLUTIONARY PROGRAMMING Professional Paper
John R. McDonnell and Don Waagen Oct. 1993 6 p
(AD-A273242) Avail: CASI HC A02/MF A01

This work investigates the application of evolutionary programming, a stochastic search technique, for simultaneously determining the weights and the number of hidden units in a fully-connected, multi-layer neural network. The simulated evolution search paradigm provides a means for optimizing both network structure and weight coefficients. Orthogonal learning is implemented by independently modifying network structure and weight parameters. Different structural level search strategies are investigated by comparing the training processes for the 3-bit parity problem. The results indicate that evolutionary programming provides a robust framework for evolving neural networks. DTIC

PRACTICAL EVALUATION OF ROBUST CONTROL FOR A CLASS OF NONLINEAR MECHANICAL DYNAMIC SYSTEMS Ph.D. Thesis
Abraham Gilles deJager 1992 193 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISBN-9-03-860092-5; ETN-94-95359) Copyright Avail: CASI HC A09

A study to assess the robustness potential of controllers for a class of nonlinear mechanical systems, to get insight into the achievable performance of these control systems, and to grade several controller design methods according to the two aspects mentioned above is reported. This was achieved by using a multistage evaluation strategy, with a literature search, numerical experiments, and laboratory experiments. The control schemes studied are mostly based on the use of a nominal model of a more complicated nonlinear system. The model is used by the controller to linearize the nominal model, or to generate control inputs that achieve almost the same goal. This part of the controller can be combined with a stabilizing component, a robustifying component, and a parameter adaptation component. The use of acceleration signals to improve the estimation of state variables and to enhance the robustness is studied. Control concepts that adapt the structure of the controller, instead of only the parameters, are not studied. The development of an appreciation strategy, using observation, manipulation, and experimentation techniques, to find and qualify robust controllers is discussed. ESA

MIMO SYSTEM IDENTIFICATION FOR H(INFINITY) ROBUST CONTROL: A FREQUENCY DOMAIN APPROACH WITH MINIMUM ERROR BOUNDS Ph.D. Thesis
Antonius Josephus J. vandenBoom 1993 223 p
(ETN-94-95354) Avail: CASI HC A10/MF A03

A frequency domain system identification procedure for MIMO systems that yields a model with a bounded unstructured model error is presented. The disturbances on the input and output of the process are assumed to be bounded in the frequency domain, which implies that there exist bounding functions for the absolute value of the discrete Fourier transform of the noise signals. The identification of a SISO process is considered. Uncertainty regions for the process dynamics are derived and an optimal model by H(sub infinity) fitting is found. The identification method is extended to MIMO systems and various model error structures are considered. It is shown that for a fixed model the true model error can be expressed as a function of a known matrix G(z) and an unknown diagonal matrix Q(sub t)(z). An upper bound for the largest singular value of the model error is derived. The theory of structured singular values and of the so called Redheffer star products are used. The upper bounds for the model error are minimized in some norm sense. The choice of a linear parametrization leads to a convex optimization problem and the algorithms are robustly convergent. A case study, where a laboratory process with 2 inputs and 2 outputs is identified and a model with a bound on the model error, is derived. ESA

DATA STRUCTURES AND AMORTIZED COMPLEXITY IN A FUNCTIONAL SETTING Ph.D. Thesis
Lambertus Adrianus M Schoenmakers 1992 208 p
(ETN-94-95307) Avail: CASI HC A10/MF A03

The purpose of the work is to increase the understanding of amortized complexity, particularly in the nature of potential functions. Potentials for a number of data structures were derived as systematically as possible. The necessary tools needed to specify and design several data structures are given. The notion of algebra refinement is defined for monoalgebras only. It is shown that any amortized analysis can be done in terms of a potential function. It is also shown that: the fact that the number of deckey operations on each node is bounded by a constant K gives rise to more efficient implementations; and that, depending on the ratio of the number of unions and the number of delmins, different bounds for the amortized costs of these operations are obtained. The conjecture that the log phi bound for top down melding is tight is made. ESA

ON-LINE CONTROL OF DYNAMIC SYSTEMS USING FEEDFORWARD NEURAL NETWORKS
Eliezer Colina-Morles and Niel Mort Aug. 1992 23 p
(RR-457; ETN-94-95129) Avail: CASI HC A03/MF A01

An adaptive neural network based control scheme is proposed. Its performance was digitally simulated using an unknown plant which belongs to a certain class of nonlinear systems. The role of the multilayer neural network considered was to make an online estimation of the unknown input/output behavior of the plant. The purpose is to drive the system's behavior according to the specifications given by a reference model. The learning algorithm used to update the weights of the network allows dynamic adjustment of their values to cope with varying signals coming from the unknown plant. The best results were obtained using a three layer neural network to estimate the unknown input/output behavior of the plant and by assuming that the teaching signal was not a constant one. In this case, the inputs to the neural network were three unitary step functions. ESA

THE PHASE RESPONSE OF NONLINEAR SYSTEMS
S. A. Billings and H. Zhang 11 Aug. 1992 34 p
(Grant SERC-GR/F-8564.2)
(RR-458; ETN-94-95130) Avail: CASI HC A03/MF A01

The phase response function is analyzed and interpreted to provide a clear understanding of nonlinear systems. Systems which include delay elements are also discussed. Simulations of both continuous and discrete time nonlinear systems are included. Results for linear systems are reviewed. An expression for the phase response for a wide class of nonlinear systems is derived. The phase response to a multifrequency input is derived to illustrate how the phase shift of both the input excitation and the phase response of the nonlinear system influence the overall system response. The effects of delay elements on the system are considered. The importance of phase in the interpretation of nonlinear frequency response functions is demonstrated. Frequency mixing, which plays a prominent part in nonlinear frequency response analysis, is overviewed. ESA

ROSAT MISSION PLANNING USING ARTIFICIAL INTELLIGENCE METHODS [ROSAT-MISSIONSPLANUNG MIT METHODEN DER KUENSTLICHEN INTELLIGENZ]
Yukio Oku 21 Apr. 1993 39 p In GERMAN
(DLR-FB-93-14; ETN-94-95202) Avail: CASI HC A03/MF A01

The artificial intelligence scheduler, SPIKE (Science Planning Interactive Knowledge Environment) was successfully applied to the planning task of ROSAT. SPIKE supports two modes: an automatic mode for offline scheduling and a graphical interactive mode for users, which can make problem diagnostics. The SPIKE architecture contains two levels: a low constraint representation and reasoning level and a high strategic scheduling level, which allows multistart stochastic repair mechanisms, which come from a discrete stochastic neural network. The ROSAT mission planning through SPIKE is depicted: parameter value estimation and initialization, calculation of suitability functions and interactive planning. SPIKE advantages, such as software readability, high performance, user friendly interface, effective preprocessing and possibility of handling preferences and uncertain factors, are assessed. ESA

KERNELS OF ANTI-CAUSAL OPERATORS AND THE MULTIVARIABLE GENERALIZED PREDICTIVE CONTROL PROBLEM
B. Kouvaritakis (Oxford Univ., England.), J. A. Rossiter, and A. O. T. Chang (Oxford Univ., England.) Aug. 1993 25 p Sponsored by United Kingdom Science and Engineering Research Council, and Croucher Foundation
(MATHS-Rept-A-191; ETN-94-95228) Avail: CASI HC A03/MF A01

Eigenvector or principal direction projections provide a convenient means of decomposing the multivariable problem into a set of scalar control problem. They can be solved using single input single output generalized predictive control. The bicausal nature of eigenvector or principal direction representations leads to anticausality difficulties. The use 'kernels' of bicausal operators is proposed as an effective remedy for the scalar case. The relationship between these kernels and scaling of the bicausal representations is studied. Algorithms which overcome the pseudodelay problems in the multivariable case are proposed. An algorithm for the characterization of all the available degrees of freedom is given. They are introduced into the scalar predictive control cost and the control law is computed by a process of back projection. The algorithms proposed match the set point following behavior and remove the problem of pseudo delays. ESA

THE USE OF KNOWLEDGE SYSTEMS Ph.D. Thesis [HET NUT VAN KENNISSYSTEMEN]
Robert Victor Schuwer 1993 194 p In DUTCH
(ETN-94-95318) Avail: CASI HC A09/MF A03

An investigation as to the situations for which a knowledge base system is a proper solution, and what is the added value that a knowledge base system can provide compared to alternative solving methods is presented. A formal model that unambiguously describes the architecture of a knowledge base system was developed. This model is mainly used for the identification of situations in which knowledge base systems have an added value. A knowledge base system can serve as a solution when a demand exists to clarify the way of reasoning of a system to the user, and in those situations where an explicit need for knowledge management exists. To be accepted and used in an operational environment, knowledge base systems have to be integrated within a total systems architecture. ESA

PRODUCT FORMS AS A SOLUTION BASE FOR QUEUEING SYSTEMS
Ivo J. B. F. Adan and Jaap Wessels Sep. 1992 14 p
(MEMO-COSOR-92-37; ETN-94-94798; PB94-126596) Avail: CASI HC A03/MF A01

Queueing systems which have solutions in the form of linear combinations of product forms are investigated. The case when the equilibrium distribution of one or two dimensional Markovian queueing systems can be written as linear combination of products of powers is discussed. Cases with extra supplementary variables are investigated. Product form networks as the solution of a set of partial difference equations with boundary conditions are studied. The queueing system E(sub K)/E(sub r)/c is presented. The general theory for two dimensional systems is given. The results show that the concept of constructing solutions in the form of linear combinations of product forms is useful for several queueing problems. ESA

TOOL SHARING: AN APPLICATION OF MAX-ALGEBRA, PART 2
W. M. Nawijn Mar. 1993 12 p
(MEMO-1122; ETN-94-94758) Avail: CASI HC A03/MF A01

The second part of a study on the long run behavior of a system of recurrent equations to be studied in max-algebra is presented. Given are m identical machines each of which performs the same N operations 0(sub i), i less than or equal to N and greater than or equal to 1, cyclically and indefinitely, that is, a production run looks like 0(sub 1), 0(sub 2),..., 0(sub N), 0(sub 1), 0(sub 2),..., 0(sub N), 0(sub 1)... There are n(sub i) less than or equal to m tools available to perform operation i. The tools are transported between the machines by means of an infinitely fast transport device. The existence of stationary cyclic behavior is proved and the corresponding cycle time is derived. As a particular case, the system in which the tools can be partitioned into two subsets W and W(bar), such that W = (j : n(sub j) = m) and W(bar) = (j : n(sub j) = 1) is discussed. ESA

TOUGHNESS AND TRIANGLE-FREE GRAPHS
D. Bauer (Stevens Inst. of Tech., Hoboken, NJ.), J. P. vandenHeuvel, and E. Schmeichel (San Jose State Univ., CA.) Mar. 1993 20 p Sponsored in part by Netherlands Organization for Scientific Research
(Grants NATO-CRG-921251; NSF DMS-92-06991)
(MEMO-1127; ETN-94-94763) Avail: CASI HC A03/MF A01

A study which proves that there exist triangle free graphs with arbitrarily large toughness is given, thereby settling a longstanding open question. The problem of whether there exists a t-tough, n/(t + 1) regular, triangle free graph on n vertices for various values of t is explored, and a relatively complete answer for small values of t is provided. SETTING TEST LIMITS UNDER PRESCRIBED CONSUMER LOSS
W. Albers, W. C. M. Kallenberg, and G. D. Otten Jan. 1993 25 p
(MEMO-1107; ETN-94-94743) Avail: CASI HC A03/MF A01

In inspection of manufactured parts inaccuracies of the measurement process compel use of test limits which are more strict than the given specification limits. To avoid violation of the prescribed bound gamma on the consumer loss, in practice overly conservative informal approaches are used leading to a loss of yield. Approximations are derived for which gamma is realized with high precision. The expressions involved are sufficiently simple and explicit to allow extension to the more realistic case where the parameters of the underlying distributions need to be estimated. Various criteria are presented to measure the closeness of the resulting stochastic consumer losses to gamma. Some attention is devoted to the sampling schemes involved. ESA

TOOL SHARING: AN APPLICATION OF MAX-ALGEBRA, PART 1
W. M. Nawijn Jan. 1993 26 p
(MEMO-1108; ETN-94-94744) Avail: CASI HC A03/MF A01

The first part of a study on long run behavior of a system of recurrent equations to be studied in max-algebra is presented. There are m identical machines each of which perform the same N operations, with processing times a(sub 1), a(sub 2),..., a(sub N) cyclically and indefinitely. There is only one tool per operation. The tools are transported between the machines by means of an infinitely fast transport device. The behavior of the system in the long run is investigated. In particular, the existence of stationary cyclic behavior is proved and the corresponding cycle time is determined. The time to reach the stationary cycle is also determined. The problem is analyzed by means of max-algebra. ESA

LONG CYCLES IN GRAPHS WITH PRESCRIBED TOUGHNESS AND MINIMUM DEGREE
D. Bauer (Stevens Inst. of Tech., Hoboken, NJ.), H. J. Broersma, J. P. M. vandenHeuvel, and H. J. Veldman Jan. 1993 14 p
(Contract NATO-CRG-921251; MDA904-84-H-2008)
(MEMO-1109; ETN-94-94745) Avail: CASI HC A03/MF A01

A cycle C of a graph G is a D(sub lambda) cycle if every component of G - V(C) has order less than lambda. Using the notion of D(sub lambda) cycles, results concerning long cycles in graphs with prescribed toughness and minimum degree are established. Let G be a t-tough graph on n greater than or equal to 3 vertices. If delta is greater than (n/(t + lambda)) + delta - 2 for some lambda less than or equal to t + 1, then G contains a D(sub lambda) cycle. In particular, if delta is greater than (n/(t + 1)) - 1, then G is hamiltonian, improving a classical result of Dirac for t greater than 1. If G is nonhamiltonian and delta is greater than (n/(t + lambda)) + lambda - 2 for some lambda less than or equal to t + 1, then G contains a cycle of length at least (t + 1)(delta - lambda + 2) + t, partially improving another classical result of Dirac for t greater than 1. OFF-CRITICAL W(INFINITY) AND VIRASORO ALGEBRAS AS DYNAMICAL SYMMETRIES OF THE INTEGRABLE MODELS
G. Sotkov and M. Stanishkov (Sao Paulo Univ., Brazil.) 1993 22 p Presented at the NATO Workshop on Integrable Quantum Field Theories, Como, Italy, Sep. 1992 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-633215; IFT-P-001/93) Avail: CASI HC A03 (US Sales Only)

An infinite set of new non-commuting conserved charges in a specific class of perturbed CFT's is founded and a criterion for their existence is presented. They appear to be higher momenta of the already known commuting conserved currents. The algebra they close consists of two non-commuting W(infinity) algebras. Various Virasoro subalgebras of the full symmetry algebra are founded. It is shown on the examples of the perturbed Ising and Potts models that one of them plays an essential role in the computation of the correlation functions of the fields of the theory. DOE

IMPLEMENTATION AND PARALLELIZATION OF FAST MATRIX MULTIPLICATION FOR A FAST LEGENDRE TRANSFORM
Wentao Chen (Denison Univ., Granville, OH.) Sep. 1993 30 p
(Contract DE-AC05-84OR-21400)
(DE94-002184; ORNL/TM-12285) Avail: CASI HC A03/MF A01

An algorithm was presented by Alpert and Rokhlin for the rapid evaluation of Legendre transforms. The fast algorithm can be expressed as a matrix-vector product followed by a fast cosine transform. Using the Chebyshev expansion to approximate the entries of the matrix and exchanging the order of summations reduces the time complexity of computation from O(n(exp 2)) to O(n log n), where n is the size of the input vector. Our work has been focused on the implementation and the parallelization of the fast algorithm of matrix-vector product. Results have shown the expected performance of the algorithm. Precision problems which arise as n becomes large can be resolved by doubling the precision of the calculation. DOE

MAKING SOME ISSUES OF IMPLICIT KNOWLEDGE EXPLICIT
W. VanDerHoek and J. J. C. Meyer May 1992 34 p
(PB93-220606; IR-290) Avail: CASI HC A03/MF A01

The authors discuss issues of expressibility and completeness of the logic of implicit knowledge (I) and 'everybody's knowledge' (E), as introduced in a system with a number m of epistemic agents by Halpern and Moses. The operator E is defined as a conjunction and corresponds semantically to the union of the m accessibility relations. Dually, the operator I is semantically associated with an intersection, but it is, surprisingly, not equivalent with a disjunction. From the view of Kripke structures, there is a related asymmetry: although union can be modally defined, intersection cannot. The authors discuss consequences (in terms of (in)expressibility, correspondence and completeness) of this property for the epistemic logic under consideration and also present an extension of modal logic in which intersection is expressible. ON THE DAUBECHIES-BASED WAVELET DIFFERENTIATION MATRIX Final Report
Leland Jameson Dec. 1993 54 p Submitted for publication
(Contract NAS1-19480; RTOP 505-90-52-01)
(NASA-CR-191583; NAS 1.26:191583; ICASE-93-95) Avail: CASI HC A04/MF A01

The differentiation matrix for a Daubechies-based wavelet basis is constructed and superconvergence is proven. That is, it will be proven that under the assumption of periodic boundary conditions that the differentiation matrix is accurate of order 2M, even though the approximation subspace can represent exactly only polynomials up to degree M-1, where M is the number of vanishing moments of the associated wavelet. It is illustrated that Daubechies-based wavelet methods are equivalent to finite difference methods with grid refinement in regions of the domain where small-scale structure is present. Author

MEDIAN STABILIZATION DEGREE OF A MEDIAN ALGEBRA
H. J. Bandelt and M. VandeVel (Hamburg Univ., Germany.) Nov. 1992 15 p See also PB88-127774 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-220010; WS-405) Avail: CASI HC A03

The median stabilization degree (msd) of a median algebra measures the largest possible number of steps needed to generate a sub-algebra with an arbitrary set of generators. The authors determine the value of msd of a graphic n-cube Q(sub n) and they derive an estimation of msd for the natural median operator of R(sup n) which is sharp up to one or two units. Interestingly, msd of Q(sub n) and of R(sup n) grows like log to the base 1.5 of n. Finally, the authors characterize median algebras and median graphs of msd less than or equal to one in terms of forbidden subspaces and in terms of the exchange number. NTIS

TEMPORAL AGGREGATION IN A PERIODICALLY INTEGRATED AUTOREGRESSIVE PROCESS
P. H. Franses and H. P. Boswijk 1993 19 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-230480; FEW-599) Avail: Issuing Activity (National Technical Information Service (NTIS))

A periodically integrated autoregressive process for a time series which is observed s times per year is a process for which there exist s-1 co-integration relations between the annual series containing the s seasonal observations. This means that there is a single unit root in the vector autoregression for these annual series. In the paper it is shown that temporally aggregating such a process does not effect the presence of this unit root, i.e. the aggregated series is also periodically integrated. NTIS

A MIXED H2/H(INFINITY) FUNCTION FOR A DISCRETE TIME SYSTEM
Marc A. Peters Sep. 1992 21 p
(MEMO-COSOR-92-36; ETN-94-94797) Avail: CASI HC A03/MF A01

A mixed H2/H(infinity) function defined for a discrete time system is addressed. There are two inputs and one output. One input signal is a white noise stochastic process, and represents errors for example resulting from measurement noise. The other input has a more deterministic character. If there is a reference signal (for example a step) as input, this cannot be modeled as white noise, but it fits nicely into this new class of inputs. The objective is to minimize the effect of these exogenuous signals on the output of the system. The analysis of this function leads to a very useful expression in terms of a discrete algebraic Riccati equation. ESA

STRUCTURES OF TETRAHEDRIZATION: A MATHEMATICAL AND ALGORITHMICAL POINT OF VIEW Ph.D. Thesis [STRUCTURES DE TETRAEDRISATION: APPROCHES MATHEMATIQUE ET ALGORITHMIQUE]
Agnes Darmet 1992 114 p In FRENCH Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-94-95172) Avail: CASI HC A06

The generalization of a graph concept is studied. The new object, named surgraph, is defined as the union of a graph and of a set of faces defined by three vertices. The extension is similar to the one existing between triangulations and tetrahedrizations. The aim of the work is to compare the properties satisfied by triangulations and by tetrahedrizations. The interest and significance of Euler's formula, the preservation of planarity in minors, the characterization of planarity with a list of forbidden minors are discussed. These properties can be generalized in dimension three with some restrictions. A rectilinear representation of complexes is obtained. It is shown that the properties satisfied by triangulations cannot be extended to tetrahedrizations. Representations of graphs with a family of circles are considered. The proof of a part of a theorem due to Andreev and a conjecture of Lovasz on four regular planar graphs are presented. ESA

THE THEORETICAL ACCURACY OF RUNGE-KUTTA TIME DISCRETIZATIONS FOR THE INITIAL BOUNDARY VALUE PROBLEM: A CAREFUL STUDY OF THE BOUNDARY ERROR Final Report
Mark H. Carpenter (National Aeronautics and Space Administration. Langley Research Center, Hampton, VA.), David Gottlieb (Brown Univ., Providence, RI.), Saul Abarbanel (Tel-Aviv Univ., Israel.), and Wai-Sun Don (Brown Univ., Providence, RI.) NASA Nov. 1993 16 p Submitted for publication
(Contract NAS1-19480; RTOP 505-90-52-01)
(NASA-CR-191561; NAS 1.26:191561; ICASE-93-83) Avail: CASI HC A03/MF A01

The conventional method of imposing time dependent boundary conditions for Runge-Kutta (RK) time advancement reduces the formal accuracy of the space-time method to first order locally, and second order globally, independently of the spatial operator. This counter intuitive result is analyzed in this paper. Two methods of eliminating this problem are proposed for the linear constant coefficient case: (1) impose the exact boundary condition only at the end of the complete RK cycle, (2) impose consistent intermediate boundary conditions derived from the physical boundary condition and its derivatives. The first method, while retaining the RK accuracy in all cases, results in a scheme with much reduced CFL condition, rendering the RK scheme less attractive. The second method retains the same allowable time step as the periodic problem. However it is a general remedy only for the linear case. For non-linear hyperbolic equations the second method is effective only for for RK schemes of third order accuracy or less. Numerical studies are presented to verify the efficacy of each approach. Author

ON THE GIBBS PHENOMENON 3: RECOVERING EXPONENTIAL ACCURACY IN A SUB-INTERVAL FROM A SPECTRAL PARTIAL SUM OF A PIECEWISE ANALYTIC FUNCTION Final Report
David Gottlieb (Brown Univ., Providence, RI.) and Chi-Wang Shu (Brown Univ., Providence, RI.) Nov. 1993 20 p
(Contracts NAS1-19480; NAG1-1145; N00014-91-J-4016; DAAL03-91-G-0123; AF-AFOSR-0090-93; NSF DMS-92-11820; RTOP 505-90-52-01)
(NASA-CR-191560; NAS 1.26:191560) Avail: CASI HC A03/MF A01

The investigation of overcoming Gibbs phenomenon was continued, i.e., obtaining exponential accuracy at all points including at the discontinuities themselves, from the knowledge of a spectral partial sum of a discontinuous but piecewise analytic function. It was shown that if we are given the first N expansion coefficients of an L(sub 2) function f(x) in terms of either the trigonometrical polynomials or the Chebyshev or Legendre polynomials, an exponentially convergent approximation to the point values of f(x) in any sub-interval in which it is analytic can be constructed. MATHEMATICAL ADDENDA TO HOPPER'S MODEL OF PLANE STOKES FLOW DRIVEN BY CAPILLARITY ON A FREE SURFACE
J. deGraaf Jan. 1993 24 p
(PB93-237691; RANA-93-03) Avail: CASI HC A03/MF A01

In a series of papers, Hopper presents some special exact solutions of the shape evolution of a piece of viscous matter driven by surface tension on the free boundary. In Chapter 2 of this paper, the author studies several mathematical aspects of Hopper's equation. On the 'state space', which is a part of an ellipsoid in Hilbert space, Hopper's evolution equation can be considered as an infinite system of ordinary differential equations. For this system there are 3 'exhausting' series of finite dimensional sub systems leading to solutions which are: (1) complex polynomials with real coefficients, (2) complex polynomials with complex coefficients, (3) rational functions. Some local results on these finite dimensional sub systems are presented. NTIS

CHARACTERIZATIONS OF SHIFT-INVARIANT DISTRIBUTIONS BASED ON SUMMATION MODULO ONE
R. J. G. Wilms and J. G. F. Thiemann Jun. 1993 18 p
(PB93-237824; MEMO-COSOR-93-02) Avail: CASI HC A03/MF A01

For n a member of N, let X,Y(1),...,Y(n) be independent random variables, and suppose that X is distributed in ((bracket) 0,1), but not uniformly. The authors characterize the distributions of X and Y(s) (s=1,...,n) satisfying the equation (brace)X+Y(1)+...+Y(n)(brace) (equality in distribution) X, where (in braces: Z) denotes the fractional part of a random variable Z. In the case of full generality, Y(s) is lattice, and X is shift-invariant with respect to a discrete uniform distribution on ((bracket) 0,1). The authors also give a characterization of such shift invariant distributions. The authors consider some special cases of this equation: If X (equality in distribution) Y(1), then X has a shifted discrete uniform distribution on ((bracket) 0,1); further the case that Y(1),...,Y(n) are identically distributed, and a generalization of the equation with X,Y(1),...,Y(n) identically distributed is considered. These results generalize results of Goldman (1968) and of Arnold and Meeden (1976). NTIS

BAYESIAN DECISION THEORY WITH IMPRECISE PRIOR PROBABILITIES APPLIED TO REPLACEMENT PROBLEMS
F. P. A. Coolen Mar. 1993 16 p See also PB93-197507
(PB93-237634; MEMO-COSOR-93-09) Avail: CASI HC A03/MF A01

The Bayesian framework for statistical inference offers the possibility of taking expert opinions into account, and is, therefore, attractive for practical problems concerning inspection and replacement of technical systems. However, the use of a single prior distribution fails to indicate the amount of information on which subjective probabilities are based, and leads to problems when combining the opinions of several experts. The introduction of imprecise prior probabilities solves these problems, and leads to simpler and clearer elicitation of prior information. Problems concerning elicitation of lifetime distributions, combination of opinions, introduction of statistical models and calculation of bounds on expected loss within Bayesian decision theory have been analyzed and solutions proposed. In the paper, application of the concept to an age replacement problem is described. The entire process, from elicitation and model assumptions to reaching a final decision, is discussed. NTIS

LACUNARY SERIES AS QUADRATIC DIFFERENTIALS IN CONFORMAL DYNAMICS
Frederick P. Gardiner and Dennis Sullivan Jun. 1993 30 p Sponsored by NSF, Washington, DC
(PB93-238061; IHES/M/93/37) Avail: CASI HC A03/MF A01

Given a polynomial-like mapping P acting on a plane domain, one denotes the forward iterates of P under composition by P(sup n). These iterates determine a dynamical system acting on a neighborhood of the Julia set. If one assumes the Julia set is connected, one may uniformize the complement of the Julia set by a Riemann mapping r, mapping the complement to the exterior of the unit disk. The forward iterates P(sup n) are conjugated to iterates r (circle) P(sup n) (circle) 1/r, which forms a dynamical system acting on the exterior of the unit disk and which extends to an action on the unit circle. This conjugated dynamical system is expanding along the unit circle, which is a repeller. The chief result of this paper is that such dynamical systems, for a given degree, form part of a Teichmuller space. It is an infinite dimensional complex manifold modeled on a Banach space and it has a Teichmuller's metric which is complete. The Banach space is a space of quadratic differentials and, for a special case, this space is identifiable with certain lacunary series. NTIS

The Navier-Stokes equations are solved numerically for two-dimensional steady viscous laminar flows. The grids are generated based on the method of Delaunay triangulation. A finite-volume approach is used to discretize the conservation law form of the compressible flow equations written in terms of primitive variables. A preconditioning matrix is added to the equations so that low Mach number flows can be solved economically. The equations are time marched using either an implicit Gauss-Seidel iterative procedure or a solver based on a conjugate gradient like method. A four color scheme is employed to vectorize the block Gauss-Seidel relaxation procedure. This increases the memory requirements minimally and decreases the computer time spent solving the resulting system of equations substantially. A factor of 7.6 speed up in the matrix solver is typical for the viscous equations. Numerical results are obtained for inviscid flow over a bump in a channel at subsonic and transonic conditions for validation with structured solvers. Viscous results are computed for developing flow in a channel, a symmetric sudden expansion, periodic tandem cylinders in a cross-flow, and a four-port valve. Comparisons are made with available results obtained by other investigators. Author (revised)

Mixing of gaseous jets in a cross-flow has significant applications in engineering, one example of which is the dilution zone of a gas turbine combustor. Despite years of study, the design of jet injection in combustors is largely based on practical experience. A series of experiments was undertaken to delineate the optimal mixer orifice geometry. A cross-flow to core-flow momentum-flux ratio of 40 and a mass flow ratio of 2.5 were selected as representative of an advanced design. An experimental test matrix was designed around three variables: the number of orifices, the orifice aspect ratio (long-to-short dimension), and the orifice angle. A regression analysis was performed on the data to arrive at an interpolating equation that predicted the mixing performance of orifice geometry combinations within the range of the test matrix parameters. Results indicate that mixture uniformity is a non-linear function of the number of orifices, the orifice aspect ratio, and the orifice angle. Optimum mixing occurs when the asymptotic mean jet trajectories are in the range of 0.35 less than r/R less than 0.5 (where $r = 0$ is at the mixer wall) at $z/R = 1.0$. At the optimum number of orifices, the difference between shallow-angled slots with large aspect ratios and round holes is minimal and either approach will lead to good mixing performance. At the optimum number of orifices, it appears possible to have two local optimums where one corresponds to an aspect ratio of 1.0 and the other to a high aspect ratio. Author

The Sixth Copper Mountain Conference on Multigrid Methods was held on 4-9 Apr. 1993, at Copper Mountain, CO. This book is a collection of many of the papers presented at the conference and as such represents the conference proceedings. NASA LaRC graciously provided printing of this document so that all of the papers could be presented in a single forum. Each paper was reviewed by a member of the conference organizing committee under the coordination of the editors. The multigrid discipline continues to expand and mature, as is evident from these proceedings. The vibrancy in this field is amply expressed in these important papers, and the collection clearly shows its rapid trend to further diversity and depth. For individual titles, see N94-23674 through N94-23697.

A MULTIGRID SOLVER FOR THE SEMICONDUCTOR EQUATIONS
Bernhard Bachmann (Allmanna Svenska Elektriska A.B. Brown Boveri, Baden, Switzerland.) *In* NASA. Langley Research Center, The Sixth Copper Mountain Conference on Multigrid Methods, Part 1 Nov. 1993 p 1-15 (For primary document see N94-23673 06-64)
Avail: CASI HC A03/MF A03

We present a multigrid solver for the exponential fitting method. The solver is applied to the current continuity equations of semiconductor device simulation in two dimensions. The exponential fitting method is based on a mixed finite element discretization using the lowest-order Raviart-Thomas triangular element. This discretization method yields a good approximation of front layers and guarantees current conservation. The corresponding stiffness matrix is an M-matrix. 'Standard' multigrid solvers, however, cannot be applied to the resulting system, as this is dominated by an unsymmetric part, which is due to the presence of strong convection in part of the domain. To overcome this difficulty, we explore the connection between Raviart-Thomas mixed methods and the nonconforming Crouzeix-Raviart finite element discretization. In this way we can construct nonstandard prolongation and restriction operators using easily computable weighted L(exp 2)-projections based on suitable quadrature rules and the upwind effects of the discretization. The resulting multigrid algorithm shows very good results, even for real-world problems and for locally refined grids. Author (revised)

FAS MULTIGRID CALCULATIONS OF THREE DIMENSIONAL FLOW USING NON-STAGGERED GRIDS **c34**
D. Matovic, A. Pollard, H. A. Becker, and E. W. Grandmaison *In* NASA. Langley Research Center, The Sixth Copper Mountain Conference on Multigrid Methods, Part 1 Nov. 1993 p 17-29 (For primary document see N94-23673 06-64)
Avail: CASI HC A03/MF A03

Grid staggering is a well known remedy for the problem of velocity/pressure coupling in incompressible flow calculations. Numerous inconveniences occur, however, when staggered grids are implemented, particularly when a general-purpose code, capable of handling irregular three-dimensional domains, is sought. In several non-staggered grid numerical procedures proposed in the literature, the velocity/pressure coupling is achieved by either pressure or velocity (momentum) averaging. This approach is not convenient for simultaneous (block) solvers that are preferred when using multigrid methods. A new method is introduced in this paper that is based upon non-staggered grid formulation with a set of virtual cell face velocities used for pressure/velocity coupling. Instead of pressure or velocity averaging, a momentum balance at the cell face is used as a link between the momentum and mass balance constraints. The numerical stencil is limited to 9 nodes (in 2D) or 27 nodes (in 3D), both during the smoothing and inter-grid transfer, which is a convenient feature when a block point solver is applied. The results for a lid-driven cavity and a cube in a lid-driven cavity are presented and compared to staggered grid calculations using the same multigrid algorithm. The method is shown to be stable and produce a smooth (wiggle-free) pressure field. Author (revised)

Avail: CASI HC A03/MF A03

In this paper, we present an analysis of a multigrid method for nonsymmetric and/or indefinite elliptic problems. In this multigrid method various types of smoothers may be used. One type of smoother which we consider is defined in terms of an associated symmetric problem and includes point and line, Jacobi, and Gauss-Seidel iterations. We also study smoothers based entirely on the original operator. One is based on the normal form, that is, the product of the operator and its transpose. Other smoothers studied include point and line, Jacobi, and Gauss-Seidel. We show that the uniform estimates for symmetric positive definite problems carry over to these algorithms. More precisely, the multigrid iteration for the nonsymmetric and/or indefinite problem is shown to converge at a uniform rate provided that the coarsest grid in the multilevel iteration is sufficiently fine (but not depending on the number of multigrid levels). A MULTILEVEL COST-SPACE APPROACH TO SOLVING THE BALANCED LONG TRANSPORTATION PROBLEM
Kevin J. Cavanaugh and Van Emden Henson (Naval Postgraduate School, Monterey, CA.) *In* NASA. Langley Research Center, The Sixth Copper Mountain Conference on Multigrid Methods, Part 1 Nov. 1993 p 61-75 (For primary document see N94-23673 06-64)
(Grant MA000-MA999/4476-4479)
Avail: CASI HC A03/MF A03

We develop a multilevel scheme for solving the balanced long transportation problem, that is, given a set (c(sub kj)) of shipping costs from a set of M supply nodes S(sub k) to a set of N demand nodes D(sub j), we seek to find a set of flows, (x(sub kj)), that minimizes the total cost Sigma(sub k=1)(exp M) Sigma(sub j=1)(exp N) x(sub kj)c(sub kj). We require that the problem be balanced, that is, the total demand must equal the total supply. Solution techniques for this problem are well known from optimization and linear programming. We examine this problem, however, in order to develop principles that can then be applied to more intractible problems of optimization. We develop a multigrid scheme for solving the problem, defining the grids, relaxation, and intergrid operators. Numerical experimentation shows that this line of research may prove fruitful. Further research directions are suggested. Author (revised)

VECTORIZATION AND PARALLELIZATION OF THE FINITE STRIP METHOD FOR DYNAMIC MINDLIN PLATE PROBLEMS
Hsin-Chu Chen and Ai-Fang He (Illinois Wesleyan Univ., Bloomington.) *In* NASA. Langley Research Center, The Sixth Copper Mountain Conference on Multigrid Methods, Part 1 Nov. 1993 p 77-91 (For primary document see N94-23673 06-64)
(Grant DE-FG02-85ER-25001)
Avail: CASI HC A03/MF A03

The finite strip method is a semi-analytical finite element process which allows for a discrete analysis of certain types of physical problems by discretizing the domain of the problem into finite strips. This method decomposes a single large problem into m smaller independent subproblems when m harmonic functions are employed, thus yielding natural parallelism at a very high level. In this paper we address vectorization and parallelization strategies for the dynamic analysis of simply-supported Mindlin plate bending problems and show how to prevent potential conflicts in memory access during the assemblage process. The vector and parallel implementations of this method and the performance results of a test problem under scalar, vector, and vector-concurrent execution modes on the Alliant FX/80 are also presented. DOMAIN DECOMPOSITION METHODS FOR NONCONFORMING FINITE ELEMENT SPACES OF LAGRANGE-TYPE
Lawrence C. Cowsar *In* NASA. Langley Research Center, The Sixth Copper Mountain Conference on Multigrid Methods, Part 1 Nov. 1993 p 93-109 (For primary document see N94-23673 06-64)
(Grant NSF DMS-91-12847)
Avail: CASI HC A03/MF A03

In this article, we consider the application of three popular domain decomposition methods to Lagrange-type nonconforming finite element discretizations of scalar, self-adjoint, second order elliptic equations. The additive Schwarz method of Dryja and Widlund, the vertex space method of Smith, and the balancing method of Mandel applied to nonconforming elements are shown to converge at a rate no worse than their applications to the standard conforming piecewise linear Galerkin discretization. Essentially, the theory for the nonconforming elements is inherited from the existing theory for the conforming elements with only modest modification by constructing an isomorphism between the nonconforming finite element space and a space of continuous piecewise linear functions. Recently the GMRESR inner-outer iteraction scheme for the solution of linear systems of equations was proposed by Van der Vorst and Vuik. Similar methods have been proposed by Axelsson and Vassilevski and Saad (FGMRES). The outer iteration is GCR, which minimizes the residual over a given set of direction vectors. The inner iteration is GMRES, which at each step computes a new direction vector by approximately solving the residual equation. However, the optimality of the approximation over the space of outer search directions is ignored in the inner GMRES iteration. This leads to suboptimal corrections to the solution in the outer iteration, as components of the outer iteration directions may reenter in the inner iteration process. Therefore we propose to preserve the orthogonality relations of GCR in the inner GMRES iteration. This gives optimal corrections; however, it involves working with a singular, non-symmetric operator. We will discuss some important properties, and we will show by experiments that, in terms of matrix vector products, this modification (almost) always leads to better convergence. However, because we do more orthogonalizations, it does not always give an improved performance in CPU-time. Furthermore, we will discuss efficient implementations as well as the truncation possibilities of the outer GCR process. The experimental results indicate that for such methods it is advantageous to preserve the orthogonality in the inner iteration. Of course we can also use iteration schemes other than GMRES as the inner method; methods with short recurrences like GICGSTAB are of interest. Author (revised)

IMPLEMENTING ABSTRACT MULTIGRID OR MULTILEVEL METHODS
Craig C. Douglas *In* NASA. Langley Research Center, The Sixth Copper Mountain Conference on Multigrid Methods, Part 1 Nov. 1993 p 127-141 Sponsored in part by IBM and ONR (For primary document see N94-23673 06-64)
Avail: CASI HC A03/MF A03

Multigrid methods can be formulated as an algorithm for an abstract problem that is independent of the partial differential equation, domain, and discretization method. In such an abstract setting, problems not arising from partial differential equations can be treated. A general theory exists for linear problems. The general theory was motivated by a series of abstract solvers (Madpack). The latest version was motivated by the theory. Madpack now allows for a wide variety of iterative and direct solvers, preconditioners, and interpolation and projection schemes, including user callback ones. It allows for sparse, dense, and stencil matrices. Mildly nonlinear problems can be handled. Also, there is a fast, multigrid Poisson solver (two and three dimensions). The type of solvers and design decisions (including language, data structures, external library support, and callbacks) are discussed. Based on the author's experiences with two versions of Madpack, a better approach is proposed. This is based on a mixed language formulation (C and FORTRAN + preprocessor). Reasons for not using FORTRAN, C, or C++ (individually) are given. Implementing the proposed strategy is not difficult. Author (revised)

NUMERICAL SOLUTION OF FLAME SHEET PROBLEMS WITH AND WITHOUT MULTIGRID METHODS c25
Craig C. Douglas and Alexandre Ern *In* NASA. Langley Research Center, The Sixth Copper Mountain Conference on Multigrid Methods, Part 1 Nov. 1993 p 143-157 Sponsored in part by CERMICS, ENPC, IBM, ONR and DOE (For primary document see N94-23673 06-64)
Avail: CASI HC A03/MF A03

Flame sheet problems are on the natural route to the numerical solution of multidimensional flames, which, in turn, are important in many engineering applications. In order to model the structure of flames more accurately, we use the vorticity-velocity formulation of the fluid flow equations, as opposed to the streamfunction-vorticity approach. The numerical solution of the resulting nonlinear coupled elliptic partial differential equations involves a pseudo transient process and a steady state Newton iteration. Rather than working with dimensionless variables, we introduce scale factors that can yield significant savings in the execution time. In this context, we also investigate the applicability and performance of several multigrid methods, focusing on nonlinear damped Newton multigrid, using either one way or correction schemes. Author

A MIXED METHOD POISSON SOLVER FOR THREE-DIMENSIONAL SELF-GRAVITATING ASTROPHYSICAL FLUID DYNAMICAL SYSTEMS **c90**
Comer Duncan and Jim Jones (Colorado Univ., Denver.) *In* NASA. Langley Research Center, The Sixth Copper Mountain Conference on Multigrid Methods, Part 1 Nov. 1993 p 159-173 (For primary document see N94-23673 06-64)
Avail: CASI HC A03/MF A03

A key ingredient in the simulation of self-gravitating astrophysical fluid dynamical systems is the gravitational potential and its gradient. This paper focuses on the development of a mixed method multigrid solver of the Poisson equation formulated so that both the potential and the Cartesian components of its gradient are self-consistently and accurately generated. The method achieves this goal by formulating the problem as a system of four equations for the gravitational potential and the three Cartesian components of the gradient and solves them using a distributed relaxation technique combined with conventional full multigrid V-cycles. The method is described, some tests are presented, and the accuracy of the method is assessed. We also describe how the method has been incorporated into our three-dimensional hydrodynamics code and give an example of an application to the collision of two stars. We end with some remarks about the future developments of the method and some of the applications in which it will be used in astrophysics. Author

Avail: CASI HC A03/MF A03

New coarse grid multigrid operators for problems with highly oscillatory coefficients are developed. These types of operators are necessary when the characters of the differential equations on coarser grids or longer wavelengths are different from that on the fine grid. Elliptic problems for composite materials and different classes of hyperbolic problems are practical examples. The new coarse grid operators can be constructed directly based on the homogenized differential operators or hierarchically computed from the finest grid. Convergence analysis based on the homogenization theory is given for elliptic problems with periodic coefficients and some hyperbolic problems. These are classes of equations for which there exists a fairly complete theory for the interaction between shorter and longer wavelengths in the problems. Numerical examples are presented. Author

APPLICATION OF MULTIGRID METHODS TO THE SOLUTION OF LIQUID CRYSTAL EQUATIONS ON A SIMD COMPUTER **c76**
Paul A. Farrell, Arden Ruttan, and Reinhardt R. Zeller *In* NASA. Langley Research Center, The Sixth Copper Mountain Conference on Multigrid Methods, Part 1 Nov. 1993 p 191-206 (For primary document see N94-23673 06-64)
(Grant DMR89-20147)
Avail: CASI HC A03/MF A03

We will describe a finite difference code for computing the equilibrium configurations of the order-parameter tensor field for nematic liquid crystals in rectangular regions by minimization of the Landau-de Gennes Free Energy functional. The implementation of the free energy functional described here includes magnetic fields, quadratic gradient terms, and scalar bulk terms through the fourth order. Boundary conditions include the effects of strong surface anchoring. The target architectures for our implementation are SIMD machines, with interconnection networks which can be configured as 2 or 3 dimensional grids, such as the Wavetracer DTC. We also discuss the relative efficiency of a number of iterative methods for the solution of the linear systems arising from this discretization on such architectures. Author (revised)

AN ADAPTIVE MULTIGRID MODEL FOR HURRICANE TRACK PREDICTION **c47**
Scott R. Fulton *In* NASA. Langley Research Center, The Sixth Copper Mountain Conference on Multigrid Methods, Part 1 Nov. 1993 p 207-214 (For primary document see N94-23673 06-64)
(Grant NSF ATM-91-18966)
Avail: CASI HC A02/MF A03

This paper describes a simple numerical model for hurricane track prediction which uses a multigrid method to adapt the model resolution as the vortex moves. The model is based on the modified barotropic vorticity equation, discretized in space by conservative finite differences and in time by a Runge-Kutta scheme. A multigrid method is used to solve an elliptic problem for the streamfunction at each time step. Nonuniform resolution is obtained by superimposing uniform grids of different spatial extent; these grids move with the vortex as it moves. Preliminary numerical results indicate that the local mesh refinement allows accurate prediction of the hurricane track with substantially less computer time than required on a single uniform grid. Avail: CASI HC A03/MF A03

There are two main requirements for practical simulation of unsteady flow at high Reynolds number: the algorithm must accurately propagate discontinuous flow fields without excessive artificial viscosity, and it must have some adaptive capability to concentrate computational effort where it is most needed. We satisfy the first of these requirements with a second-order Godunov method similar to those used for high-speed flows with shocks, and the second with a grid-based refinement scheme which avoids some of the drawbacks associated with unstructured meshes. These two features of our algorithm place certain constraints on the projection method used to enforce incompressibility. Velocities are cell-based, leading to a Laplacian stencil for the projection which decouples adjacent grid points. We discuss features of the multigrid and multilevel iteration schemes required for solution of the resulting decoupled problem. Variable-density flows require use of a modified projection operator--we have found a multigrid method for this modified projection that successfully handles density jumps of thousands to one. Numerical results are shown for the 2D adaptive and 3D variable-density algorithms. Author (revised)

Avail: CASI HC A03/MF A03

We present ideas on how to use wavelets in the solution of boundary value ordinary differential equations. Rather than using classical wavelets, we adapt their construction so that they become (bi)orthogonal with respect to the inner product defined by the operator. The stiffness matrix in a Galerkin method then becomes diagonal and can thus be trivially inverted. We show how one can construct an O(N) algorithm for various constant and variable coefficient operators. Author

Avail: CASI HC A03/MF A03

The new multigrid (or adaptive) pseudospectral element method was carried out for the solution of incompressible flow in terms of primitive variable formulation. The desired features of the proposed method include the following: (1) the ability to treat complex geometry; (2) high resolution adapted in the interesting areas; (3) requires minimal working space; and (4) effective in a multiprocessing environment. The approach for flow problems, complex geometry or not, is to first divide the computational domain into a number of fine-grid and coarse-grid subdomains with the inter-overlapping area. Next, it is necessary to implement the Schwarz alternating procedure (SAP) to exchange the data among subdomains, where the coarse-grid correction is used to remove the high frequency error that occurs when the data interpolation from the fine-grid subdomain to the coarse-grid subdomain is conducted. The strategy behind the coarse-grid correction is to adopt the operator of the divergence of the velocity field, which intrinsically links the pressure equation, into this process. The solution of each subdomain can be efficiently solved by the direct (or iterative) eigenfunction expansion technique with the least storage requirement, i.e. O(N(exp 3)) in 3-D and O(N(exp 2)) in 2-D. Numerical results of both driven cavity and jet flow will be presented in the paper to account for the versatility of the proposed method. Author (revised)

COMPRESSIBLE TURBULENT FLOW SIMULATION WITH A MULTIGRID MULTIBLOCK METHOD **c34**
Hans Kuerten and Bernard Geurts *In* NASA. Langley Research Center, The Sixth Copper Mountain Conference on Multigrid Methods, Part 1 Nov. 1993 p 305-315 (For primary document see N94-23673 06-64)
Avail: CASI HC A03/MF A03

We describe a multigrid multiblock method for compressible turbulent flow simulations and present results obtained from calculations on a two-element airfoil. A vertex-based spatial discretization method and explicit multistage Runge-Kutta time-stepping are used. The slow convergence of a single grid method makes the multigrid method, which yields a speed factor of about 20, indispensable. The numerical predictions are in good agreement with experimental results. It is shown that the convergence of the multigrid process depends considerably on the ordering of the various loops. If the block loop is put inside the stage loop, the process converges more rapidly than if the block loop is situated outside the stage loop when a three-stage Runge-Kutta method is used. If a five-stage scheme is used, the process does not converge in the latter block ordering. Finally, the process based on the five-stage method is about 60 percent more efficient than with the three-stage method, if the block loop is inside the stage loop. Author (revised)

Self-adaptive mesh refinement dynamically matches the computational demands of a solver for partial differential equations to the activity in the application's domain. In this paper we present two C++ class libraries, P++ and AMR++, which significantly simplify the development of sophisticated adaptive mesh refinement codes on (massively) parallel distributed memory architectures. The development is based on our previous research in this area. The C++ class libraries provide abstractions to separate the issues of developing parallel adaptive mesh refinement applications into those of parallelism, abstracted by P++, and adaptive mesh refinement, abstracted by AMR++. P++ is a parallel array class library to permit efficient development of architecture independent codes for structured grid applications, and AMR++ provides support for self-adaptive mesh refinement on block-structured grids of rectangular non-overlapping blocks. Using these libraries, the application programmers' work is greatly simplified to primarily specifying the serial single grid application and obtaining the parallel and self-adaptive mesh refinement code with minimal effort. Initial results for simple singular perturbation problems solved by self-adaptive multilevel techniques (FAC, AFAC), being implemented on the basis of prototypes of the P++/AMR++ environment, are presented. Singular perturbation problems frequently arise in large applications, e.g. in the area of computational fluid dynamics. They usually have solutions with layers which require adaptive mesh refinement and fast basic solvers in order to be resolved efficiently. Author (revised)

MEDIANS AND STEINER TREES

M. vandeVel and E. Verheul Jul. 1993 12 p See also PB93-221075
(PB94-110616; WS-412) Avail: CASI HC A03/MF A01

The theory of Steiner trees deals with the problem of designing a network connecting a set of points and minimizing the total connection length. We consider this problem in median metric spaces. It is shown that Steiner trees exist and can be found in a finite number of steps. This generalizes and strengthens a result of M. Hanan for the plane. The method employed by Hanan is rather technical and ad-hoc as it involves highly specific constructions in the plane. In contrast, we have based our methods on a fairly well-developed geometry of median metric spaces. In particular, there is no need to restrict to two dimensions. NTIS

RELATIONAL ALGEBRA AND EQUATIONAL PROOFS

E. deKogel 1993 34 p
(PB94-110822; Computing Science Notes-93/23) Copyright Avail: CASI HC A03/MF A01

We show that two concepts involving equational probability can be elegantly formalized in terms of a relational algebra, equipped with two special-purpose mappings. We derive some calculus in order to prove that these concepts are equivalent, and that they are sound and complete. We illustrate the use of the relational framework by a few examples. We show the decidability of probability of an equation from a finite set of variable-free equations, where all equations are variable-free. Then we discuss a method by Reeves to deal with equations in semantic tableaux, that we can now prove to be complete in a very simple way. Finally, we discuss an equational proof format that is naturally induced by the relational formulation, and serves as a guideline in finding proofs. The relation between Reeves' rules and the construction of such proofs is made explicit. NTIS

MULTI-SET EXTENDED RELATIONAL ALGEBRA: A FORMAL APPROACH TO A PRACTICAL ISSUE

P. W. P. J. Grefen and R. A. deBy 1993 20 p
(PB94-110830; Memo-INF-93-31) Copyright Avail: CASI HC A03/MF A01

The report proposes a complete extended relational algebra with multi-set semantics. The algebra has both a clear formal background and a close connection to the standard relational algebra. The usual relational expression equivalences hold in this algebra. It further includes constructs that extend the algebra to a complete sequential database manipulation language. The complete range of topics from elementary database structures to multi-statement transactions is covered. The language can either be used as a formal background to other multi-set languages like SQL, or as a database manipulation language on its own. The practical usability of the latter option has been demonstrated in the PRISMA/DB database project, where a variant of the language, called XRA, has been used as the primary database language. LOGARITHM OF PROBABILITY MEASURES AND INFINITE DIVISIBILITY OF SUB-STABLE RANDOM VECTORS

J. K. Misiewicz 1993 16 p
(PB94-118627; REPT-93-53) Copyright Avail: CASI HC A03/MF A01

We discuss infinite divisibility of sub-stable finite dimensional random vectors. Usually one must guess the corresponding Levy measure, nu, for given a infinitely divisible measure, mu, which is rather hard. In some cases, however, it seems to be possible to get the measure, nu, as a limit of a sequence of signed measures derived from the measure, mu. Obviously the convergence cannot be weak or normed, as is usually done in functional analysis, because a probability measure has variation 1 and this lies on the boundary of the corresponding ball of convergence. We give some partial results in this area applied to sub-stable random vectors. In view of these results, it seems possible that every finite dimensional sub-stable distribution is of the form of generalized Poisson measure for some signed sigma-finite measure on R(sup n). NTIS

DESIGN AND SPECIFICATION OF A GENERIC TASK MODEL FOR SOLVING BOOLEAN CONSTRAINT SATISFACTION PROBLEMS

P. Geelen, W. Kowalczyk, Z. Ruttkay, and J. Treur Dec. 1992 92 p
(PB94-118841; IR-314) Avail: CASI HC A05/MF A01

We introduce the Boolean constraint satisfaction problem (Boolean CSP), as a natural generalization of the traditional CSP. We give motivations for this generalization, and formulate a small design example as a Boolean CSP. The language of many-sorted predicate logic serves as the basis for defining syntax and semantics of Boolean constraints. We also discuss the issue of representing such constraints in the Design and Specification of Interacting Reasoning modules (DESIRE) framework. We propose a generic task model for solving Boolean CSP's. We fully specify the resulting model, describe the separate modules in detail, and discuss two refinements. NTIS

(PB93-238020; IHES/M/93/29) Avail: CASI HC A04

The paper continues an investigation started in a 1993 paper by the author on questions of wellposedness for space-periodic evolution equations, mainly modified KdV equations. In general, these equations are not integrable and there is a lack of conserved quantities to apply approximate solution techniques. In the nonperiodic case there has been recently progress on such questions. The main point is applying a fixpoint theorem to get a local solution is a smoothness gain for which the solution operator to the linear equation is responsible. In periodic problems, there is no exact analogue to such phenomenon and the argument for regularity gain is based on an interplay between linear and nonlinear part of the equation, the exact structure of the nonlinear term being of importance. ERROR DUE TO THE STOPPING OF THE NEWTON ITERATION IN IMPLICIT LINEAR MULTISTEP METHODS
J. Groeneweg and N. M. Spijker Mar. 1993 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-101425; TW-93-05) Avail: Issuing Activity (National Technical Information Service (NTIS))

The paper concerns the numerical solution of initial value problems for nonlinear ordinary differential equations by implicit linear multistep methods. For non-stiff problems, fixed point iteration (Picard iteration), is a classical approach to the solution of the system of algebraic equations occurring in each time step of these methods. The order of the error due to the stopping of this process after a fixed number of iterations is well understood. For stiff problems, Picard iteration is not appropriate and some variant of the Newton method is usually used instead. The paper addresses the problem of estimating the stopping error of Newton-like iterations. One aims for an understanding of this error comparable to what is known about Picard iterations. Because of stiffness, the theory is more delicate than for Picard iterations. NTIS

NON-TRIVIAL EXAMPLES OF REAL ISOLATED SINGULARITY AT THE ORIGIN Memorandum Report
A. AlDhahir Apr. 1993 24 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-110939; Memo-1129) Avail: CASI HC A03

The existence of nontrivial examples of real polynomial (or differentiable) maps with isolated singularity at the origin has been shown in most dimensions. Church and Lamotke used a result by Looijenga to prove the existence of such examples. Church and Timourian have shown when such examples exist. However, such examples are rare. Milnor, in his book 'Singularities of Complex Hypersurfaces', has cited an example by Kuiper of an isolated singularity at the origin which does not come from a complex one. A'Campo has presented another example in one of his papers. The objective is to survey all these results and examples and bring them together in one article. In Section One, we introduce basic definitions and properties. Section Two is reserved for the results by Church and Lamotke, Church and Timourian, Looijenga and Milnor; while in Section Three, the only known explicit examples are stated. NTIS

SOME GENERALIZED SUBSET SELECTION PROCEDURES
Paul vanderLaan and Constance vanEeden (British Columbia Univ., Vancouver.) Jul. 1993 10 p See also PB93-237857 Limited Reproducibility: More than 20% of this document may be affected by poor print and microfiche quality
(PB94-111655; MEMO-COSOR-93-21) Avail: Issuing Activity (National Technical Information Service (NTIS))

In this paper, some generalizations of Gupta's subset selection procedure are discussed. Assume k (greater than or equal to 2) populations are given and assume that the associated random variables have distributions with unknown location parameters theta(sub i), i = 1,...,k. The ordered parameters are denoted by theta(sub 1) less than or equal to ... less than or equal to theta(sub k). On the basis of independent samples from these populations, Gupta selects a subset, as small as possible, which contains, with probability at least P*, the best population. Two generalizations are discussed. Each one is designed to give a smaller expected subset size, Epsilon S, than Gupta's procedure. The first procedure selects, with probability at least P*, an epsilon-best population whose location parameter is at least theta(sub k) - epsilon (with epsilon greater than or equal to 0). Some efficiency results for normal populations are presented. The second procedure uses a loss function and it upperbounds either the expected loss or the expected subset size, or both. The loss is taken as zero when the subset contains an epsilon-best population. Some properties of the procedure, for the case of two normal populations, are presented. NTIS

TOUGHNESS IN HAMILTONICITY IN ALMOST CLAW-FREE GRAPHS
H. J. Broersma, Z. Ryjacek (College of Mechanical and Electrical Engineering, Plzen, Czechoslovakia.), and I. Schiermeyer (Technische Hochschule, Aachen, Germany.) Feb. 1993 11 p
(MEMO-1114; ETN-94-94749) Avail: CASI HC A03/MF A01

Results on claw free (K(sub 1,3-free) graphs are generalized to the larger class of almost claw free graphs which were introduced by Ryjacek. In particular, a 2-connected almost claw free graph is shown to be 1-tough, and a 2-connected almost claw free graph on n vertices is shown to be hamiltonian if delta is greater than or equal to (1/3)(n - 2), thereby (partly) generalizing results of Matthews and Sumner. A result of Bauer et al. is used to show that a 2-connected almost claw free graph on n vertices is hamiltonian if d(u) + d(v) + d(w) is greater than or equal to n for all independent sets of vertices u, v and w. STUDIES ON THE IMPLEMENTATION OF NORMALS AND CURVATURES. PART 1: THE FIRST OR MEAN CURVATURE
Carl Rosenkilde 2 Jul. 1993 21 p
(Contract W-7405-eng-48)
(DE94-001546; UCRL-ID-115168-Pt-1) Avail: CASI HC A03/MF A01

We are interested in the construction of the unit normal and the curvatures on some surface which is represented by finite elements. We shall start with the usual definitions for the unit normal and the first and second curvatures on a continuous surface. The unit normal on some surface defined by (var phi)(x) = 0 is given by (cflx n) = (del) (phi)/the absolute value of (del) (phi), where (del) signifies the familiar three-dimensional gradient operator in space, rather than the two-dimensional gradient on the a surface, which is commonly utilized in differential geometry. The first and second curvatures, J and K, which involve invariant functions of this normal, may be expressed in the form: 2J = (del)(center dot)(cflx n) and 2K = (del)(center dot)((cflx n)((del)(center dot)(cflx n)) + (cflx n) x ((del) x (cflx n)). The expression for J has the same formal appearance regardless of which gradient operator is used, but the expression for K differs from the two-dimensional version because of the expansion for the Laplacian of a vector. UNIFORM LIMIT THEOREMS FOR MARKED POINT PROCESSES
Gert Niewenhuis 1993 40 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-118726; FEW-606) Avail: CASI HC A03

Let P be the distribution of a stationary marked point process on R and let P(sup 0, sub L) be its Palm distribution with respect to a set L of marks. Starting from P, the probability measures P(sub i,L), i is an element of Z, arise by shifting the origin to the i'th occurrence with mark in L. Q(sup 0, sub L) is a probability measure which equals P(sup 0, sub L) under a weak ergodicity condition. In the present research this uniform limit theorem is generalized by replacing 1(sub B) by functions f with the absolute value of f uniformly bounded by a fixed function g. It is also proved that similar results hold if the starting point P is replaced by P(sup 0, sub L'), where L' is another set of marks with L intersection L' = 0. As a preliminary, a theorem is proved which implies an easy way to express P(sup 0, sub L')-expectations in terms of P(sup 0, sub L)-expectations. In a 'dual' theorem roles of P and P(sup 0, sub L) are interchanged. Starting from P(sup 0, sub L) similar uniform limit theorems are derived for Cesaro averaged functionals. The limits can be expressed as expectations under a probability measure Q(sub L) which equals P under weak ergodicity condition. In a final section it is shown that uniform approximation of P(sup 0, sub L) and P is still possible without ergodicity restraints. NTIS

Nonlinear control using feedback linearization or inverse dynamics for robotic manipulators yields good results in the absence of modeling uncertainty. However, modeling uncertainties due to unknown joint friction coefficients and payload variations can give rise to undesirable characteristics when these control systems are implemented. It is shown how passivity concepts can be used to supplement the feedback linearization control design technique, in order to make it robust with respect to the uncertain effects mentioned above. Results are obtained for space manipulators with freely floating base; however, they are applicable to fixed base manipulators as well. The controller guarantees asymptotic tracking of the joint variables.

Closed-loop simulation results are illustrated for planar space manipulators for cases where uncertainty exists in friction modeling and payload inertial parameters. Author

POLYNOMIALS ORTHOGONAL WITH RESPECT TO AN INNER PRODUCT INVOLVING DIFFERENCES
H. Bavinck 1992 18 p
(PB94-110731; Rept-92-81) Copyright Avail: CASI HC A03/MF A01

In this paper we consider the inner product (f,g) = integral over R of f g d(phi)(x) + lambda (delta)f(c) (delta)g(c), where c is a member of R and phi is a distribution function with infinite spectrum such that the interval (c,c+1) does not contain points of the spectrum of phi. Furthermore lambda less than or equal to 0, f and g are functions on R and (delta)f(c) = f(c+1) - f(c). Let (Q(sub n, sup lambda)(x)) be the sequence of monic orthogonal polynomials with respect to this inner product and (P(sub n)(x)), (P(sub n, sup c)(x)) the sequences of monic standard orthogonal polynomials (lambda = 0) with respect to d(phi)(x) and (x-c)(x-c-1)d(phi)(x) respectively. We derive an explicit representation for Q(sub n, sup lambda)(x) in terms of P(sub n)(x) and P(sub n, sup c)(x) and we present some results on the distribution of the zeros of Q(sub n, sup lambda)(x) in relation to the zeros of P(sub n)(x). Finally we treat the special case where P(sub n)(x) are Charlier polynomials and c = 0. NTIS

(Grants NSF DMS-89-03041; EEC-SCI-CT91-0695)
(PB93-238053; IHES/P/93/36) Avail: CASI HC A03

The authors prove two stability results for the scale invariant solutions of the nonlinear heat equation partial differential of u with respect to t = (Delta)u - (absolute value of u)(sup p-1)u with 1 greater than p greater than 1 + 2n, n being the spatial dimension. The first result is that a small perturbation of a scale invariant solution vanishes as t yields infinity. The second result is a global, with a positivity condition on the initial data. NTIS

SYSTEMS ENGINEERING: A FORMAL APPROACH. PART 2: FRAMEWORKS
K. M. vanHee 30 Mar. 1993 145 p See also PB93-225308 and PB94-101409 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-101391; Computing Science Notes-93/10) Avail: CASI HC A07

Part 2 defines the formalisms used to model and analyze systems. The first framework presented is called the transition systems framework. It formalizes the concept of discrete dynamic systems and their properties. The second framework is called the object framework. It formalizes the concepts of simplexes and complexes. These are static concepts used for modeling state spaces (or data bases). The third framework is called the actor framework, because it formalizes the concepts of actors and networks of actors. It generalizes the framework of Petri nets. NTIS

NON-BRITTLENESS OF A DESIRE-MODEL FOR AN OFFICE ASSIGNMENT TASK
Pieter Geelen, Sofia Ruttkay, and Jan Treur Dec. 1992 43 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-119021; IR-317) Avail: Issuing Activity (National Technical Information Service (NTIS))

The first challenge was to build a model for solving a given office assignment problem. Then the brittleness of the built model had to be explored, by testing it against a slightly modified version of the initially given problem. We briefly discuss our original model and analyze the trace of solving the first problem. Then, after having clarified possible reasons for brittleness, we analyze the behavior of our model with respect to the modified problem. We show that by some minor changes, we could improve our model in such a way that it could cope with the modified problem as well. The modification could be carried out easily due to the clear, modular architecture of our model. The modifications correspond to alternative interpretations of pieces of the problem solving protocol of the first problem. Moreover, it is shown that our initial model can always be turned into a non-brittle one without introducing any additional module, such as one for backtracking. NTIS

CRITERION FOR SOME HAMILTONIAN GRAPHS TO BE HAMILTON-CONNECTED Memorandum Report
A. S. Asratian May 1993 13 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-110921; MEMO-1131) Avail: Issuing Activity (National Technical Information Service (NTIS))

Let M = (G/K(sub n,n) included in G included in K(sub n) V (K bar)(sub n) for some n = or greater than 3) where V is the join operation. The author and N. K. Khachatrian proved that a connected graph G of order at least 3 is hamiltonian if d(u) + d(v) = or greater than the absolute value of (N(u) joined to N(v) joined to N(w)) for each triple of vertices u, v, w with d(u,v) = 2 and w is a member of N(u) (intersection) N(v) where N(x) is the neighborhood of a vertex x. We prove here that a graph G satisfying the above conditions is Hamilton-connected if and only if G is 3-connected and G is not a member of M. NTIS

IRREDUCIBLE CORE OF A MINIMUM COST SPANNING TREE GAME
Harry F. M. Aarts and Theodore S. H. Driessen May 1993 15 p See also PB93-194728 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-110962; MEMO-1133) Avail: Issuing Activity (National Technical Information Service (NTIS))

It is a known result that for a minimum cost spanning tree (mcst) game a Core allocation can be deduced directly from a mcst in the underlying network. To determine this Core allocation one only needs to determine a mcst in the network and it is not necessary to calculate the coalition values of the corresponding mcst game. The paper deduces other Core allocations directly from the network, without determining the corresponding mcst game itself: it presents two procedures that determine a part of the Core (called the Irreducible Core) from the network. CORSS: CYLINDER OPTIMIZATION OF RINGS, SKIN, AND STRINGERS
J. Finckenor, P. Rogers, and N. Otte Washington Jan. 1994 91 p
(NASA-TP-3457; M-740; NAS 1.60:3457) Avail: CASI HC A05/MF A01

Launch vehicle designs typically make extensive use of cylindrical skin stringer construction. Structural analysis methods are well developed for preliminary design of this type of construction. This report describes an automated, iterative method to obtain a minimum weight preliminary design. Structural optimization has been researched extensively, and various programs have been written for this purpose. Their complexity and ease of use depends on their generality, the failure modes considered, the methodology used, and the rigor of the analysis performed. This computer program employs closed-form solutions from a variety of well-known structural analysis references and joins them with a commercially available numerical optimizer called the 'Design Optimization Tool' (DOT). Any ring and stringer stiffened shell structure of isotropic materials that has beam type loading can be analyzed. Plasticity effects are not included. It performs a more limited analysis than programs such as PANDA, but it provides an easy and useful preliminary design tool for a large class of structures. This report briefly describes the optimization theory, outlines the development and use of the program, and describes the analysis techniques that are used. Examples of program input and output, as well as the listing of the analysis routines, are included. Author (revised)

EFFICIENCY OF SUBSET SELECTION OF AN EPSILON-BEST UNIFORM POPULATION RELATIVE TO SELECTION OF THE BEST ONE
Paul vanderLaan Apr. 1993 13 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-237741; MEMO-COSOR-93-12) Avail: CASI HC A03

Assume k(= or greater than 2) uniform populations are given on (mu(i) - 1/2, mu(i) + 1/2) with location parameter mu(i) a member of R(sup 1), i = 1,...,k. The best population is defined as the population with the largest value of the location parameter. In epsilon-best population (with epsilon = or greater than 0) is a population with location parameter on a distance not larger than epsilon from the largest value of mu. It is possible to consider subset selection for an epsilon-best population relative to subset selection for the best one. The relative efficiency is defined and computed in dependence of k and epsilon for some values of the confidence level P* of selection. NTIS

PROJECTION TECHNIQUES FOR ITERATIVE SOLUTION OF A(BAR x) EQUALS (BAR b) WITH SUCCESSIVE RIGHT-HAND SIDES Final Report
Paul F. Fischer (Brown Univ., Providence, RI.) Dec. 1993 14 p Submitted for publication
(Contract NAS1-19480; NSF ASC-91-07674; RTOP 505-90-52-01)
(NASA-CR-191571; NAS 1.26:191571; ICASE-93-90) Avail: CASI HC A03/MF A01

Two projection techniques for computing approximate solutions to linear systems of the form A(bar x)(sup n) = (bar b)(sup n), for a sequence n = 1, 2, ..., e.g., such as arises from time discretization of a partial differential equation, are presented. The inexpensive approximate solutions can be used as initial guesses for iterative solution of the system, resulting in significantly reduced computational expense. Examples of two- and three-dimensional incompressible Navier-Stokes calculations are presented in which x represents the pressure, and A is a discrete Poisson operator. In flows containing significant dynamic activity, these projection techniques lead to as much as a two-fold reduction in solution time. Author (revised)

EXPLOITING STRUCTURE: INTRODUCTION AND MOTIVATION Annual Status Report, 1 Mar. 1993 - 28 Feb. 1994
Zhong Ling Xu Feb. 1994 10 p
(Grant NAG5-2210)
(NASA-CR-195136; NAS 1.26:195136) Avail: CASI HC A02/MF A01

This annual report summarizes the research activities that were performed from 26 Jun. 1993 to 28 Feb. 1994. We continued to investigate the Robust Stability of Systems where transfer functions or characteristic polynomials are affine multilinear functions of parameters. An approach that differs from 'Stability by Linear Process' and that reduces the computational burden of checking the robust stability of the system with multilinear uncertainty was found for low order, 2-order, and 3-order cases. We proved a crucial theorem, the so-called Face Theorem. Previously, we have proven Kharitonov's Vertex Theorem and the Edge Theorem by Bartlett. The detail of this proof is contained in the Appendix. This Theorem provides a tool to describe the boundary of the image of the affine multilinear function. For SPR design, we have developed some new results. The third objective for this period is to design a controller for IHM by the H-infinity optimization technique. The details are presented in the Appendix. Author (revised)

TRIANGULAR SPECTRAL ELEMENTS FOR INCOMPRESSIBLE FLUID FLOW Final Report
C. Mavriplis (George Washington Univ., Washington, DC.) and John VanRosendale Dec. 1993 19 p Presented at the AIAA 11th CFD Conference, Orlando, FL, 6-9 Jul. 1993
(Contract NAS1-19480; NSF ECS-92-09347; RTOP 505-90-52-01)
(NASA-CR-191588; ICASE-93-100; NAS 1.26:191588) Avail: CASI HC A03/MF A01

We discuss the use of triangular elements in the spectral element method for direct simulation of incompressible flow. Triangles provide much greater geometric flexibility than quadrilateral elements and are better conditioned and more accurate when small angles arise. We employ a family of tensor product algorithms for triangles, allowing triangular elements to be handled with comparable arithmetic complexity to quadrilateral elements. The triangular discretizations are applied and validated on the Poisson equation. These discretizations are then applied to the incompressible Navier-Stokes equations and a laminar channel flow solution is given. These new triangular spectral elements can be combined with standard quadrilateral elements, yielding a general and flexible high order method for complex geometries in two dimensions. EVOLVING NEURAL NETWORK CONNECTIVITY Professional Paper
J. R. McDonnell and D. Waagen Oct. 1993 8 p
(AD-A273134) Avail: CASI HC A02/MF A01

This work investigates the application of evolutionary programming, a stochastic search technique, for determining connectivity in feedforward neural networks. The method is capable of simultaneously evolving both the connection scheme and the network weights. The number of connections are incorporated into an objective function so that network parameter optimization is done with respect to network complexity as well as mean pattern error. Experimental results are shown for simple binary mapping problems. DTIC

GENERALIZED GAUSSIAN QUADRATURE RULES FOR SYSTEMS OF ARBITRARY FUNCTIONS
J. Ma, V. Rokhlin, and S. Wandzura Oct. 1993 59 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contracts F49620-91-C-0084; N00014-89-J-1527)
(AD-A273610; YALEU/DCS/RR-990) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

In an earlier work, a far-reaching generalization of the classical Gaussian quadrature rules is introduced, replacing the polynomials with a wide class of functions. While the rules of that report possess most of the desirable properties of the classical Gaussian integration formulae (positivity of the weights, etc.), it is not clear from said research how such quadrature rules can be obtained numerically. In this paper, we present a numerical scheme for the generation of such generalized Gaussian quadratures. The algorithm is applicable to a variety of functions, including smooth functions as well as functions with end-point singularities. The performance of the algorithm is demonstrated with several numerical examples. DTIC

CHARACTERISTIC METHOD FOR ONE-DIMENSIONAL SCALAR HYPERBOLIC CONSERVATION LAWS WITH STIFF SOURCE TERMS
A. C. Berkenbosch, E. F. Kaasschieter, and J. H. M. tenThijeBoonkamp Mar. 1993 21 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-237675; RANA-93-05) Avail: CASI HC A03

The initial value problem for scalar hyperbolic conservation laws in one space dimension, with (stiff) source terms was considered. The source term admits two equilibrium states as solutions of the underlying characteristic equation, one unstable and one stable. An essential numerical difficulty for this initial value problem is that numerical reaction waves are propagating at non-physical wave speeds. An implicit numerical method is introduced which produces discontinuities propagating at the correct speed. It is proved that this method preserves monotone profiles and an estimate for the global discretization error is given. The numerical results illustrate the correct behavior of this method. NTIS

ALGEBRAIC-GEOMETRIC CODES AND THEIR DECODING ALGORITHMS Ph.D. Thesis
Ba-Zhong Shen 1992 118 p
(ETN-94-95294) Avail: CASI HC A06/MF A02

Several problems involving algebraic-geometric codes and Goppa codes are discussed: how to handle all linear codes using algebraic geometry; is it possible to give an explicit construction with less complexity of asymptotically good binary codes meeting a good bound; and how to give an efficient encoding and decoding algorithm for algebraic-geometric codes. It is shown that all linear codes can be described as algebraic-geometric codes. A sequence of asymptotically good binary concatenated codes using curves is given. A class of algebraic-geometric codes which have similar properties as maximal distance separable codes is considered. A correct account of the results found by another author concerning a decoding algorithm for Goppa codes is given. The gamma-graded algebra, the gamma basis and a minimal solution of a congruence are provided. Codes constructed from Hermitian curves and the way to compute the residues explicitly by a given data base are presented. ESA

THE RENORMALIZATION GROUP FOR FLAG MANIFOLDS
S. Randjbar-Daemi and J. Strathdee Oct. 1992 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616846; IC-92/354) Avail: CASI HC A03 (US Sales Only)

The renormalization group equations for a class of non-relativistic quantum sigma-models targeted on flag manifolds are given. These models emerge in a continuum limit of generalized Heisenberg antiferromagnets. The case of the SU(3)/U(1)xU(1) manifold is studied in greater detail. It was shown that at zero temperature there is a fixed point of the RG transformations in (2 + epsilon)-dimensions where the theory becomes relativistic. The linearized RG transformations in the vicinity of this fixed point are studied and it was shown that half of the couplings are irrelevant. It was also shown that at this fixed point there is an enlargement of the global isometries of the target manifold. A discrete non-abelian enlargement of this kind was constructed. DOE

N94-25214 International Centre for Theoretical Physics, Trieste (Italy).
THE FUNDAMENTAL GROUP OF THE COMPLEMENT OF COMPLEXIFIED REAL ARRANGEMENTS
Viet Dung Nguyen Oct. 1992 11 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616847; IC-92/355) Avail: CASI HC A03 (US Sales Only)

Let V be a finite dimensional vector space over the real or complex numbers. An arrangement in V is a finite collection of affine hyperplanes of V. Given a real arrangement A in a real vector space V, then its complexification, A(sub C), is a complex arrangement in the complex vector space V(sub C), and will be called a complexified real arrangement. A presentation for the fundamental group of the complement of a complexified real arrangement was proved. DOE

THE STATE SPACE METHOD FOR INTEGRO-DIFFERENTIAL EQUATIONS OF CONVOLUTION TYPE WITH RATIONAL MATRIX SYMBOLS Ph.D. Thesis
Andre Bauke Kuijper 1992 179 p Sponsored by Netherlands Organization for Scientific Research
(ETN-94-95379) Copyright Avail: CASI HC A09/MF A02

The state space method, developed to deal with problems in mathematical analysis involving rational matrix valued functions, is used to study systems of integro-differential equations. The spectral properties of matrix pencils and realizations are studied. A number of auxiliary results that play an important role later are presented. Singular differential equations are reviewed. The general solutions are described in terms of the data for the decomposition of the pencil. Equations where differentiations occur under the integral sign are reduced by a linearization method to equations of type (H). Equations with distributional right hand sides are presented. The connection between the inversion properties of the operator T(sub W) and a factorization of its symbol W is discussed. The analogs of some theorems for the finite interval are given. Results concerning the projection method for some of the equations are summarized. ESA

N94-25245# Amsterdam Univ. (Netherlands). Dept. of Mathematics and Computer Science.
WIENER-HOPF FACTORIZATION OF RATIONAL MATRIX FUNCTIONS IN TERMS OF REALIZATIONS: AN ALTERNATIVE VERSION Ph.D. Thesis
Gilbert Joseph Groenewald 1993 142 p Sponsored by Vrije Univ., Amsterdam, Netherlands
(ETN-94-95380) Avail: CASI HC A07/MF A02

An alternative version of the construction of a noncanonical Wiener-Hopf factorization is presented. The canonical factorization theorem for rational matrix functions and an inversion theorem for a block Toeplitz are summarized. The advantages of the chosen representaion of the function W are explained. The explicit formulas for a Wiener-Hopf factorization for W are presented. The main Wiener-Hopf factorization theorem derived is shown. Preliminaries about null pole triples association are shown. Certain standard null pole triples are presented in a canonical way. The notion of a minimal supplement and standard null pole triples associated with minimal realizations defined by admissible Sylvester data sets and minimal supplements are developed. Particular minimal supplements are constructed.

It is shown that the associated rational matrix functions are column reduced up to the basis transformation. An auxiliary factorization result which is used to give the proof of the Wiener-Hopf factorization theorem is presented. An alternative proof of the main result is given. Auxiliary material about full range and null kernel pairs which is of independent interest and will be needed to obtain the parametrization of the set of all solutions of the problem is included. The results are specified and developed for matrix polynomials. ESA

N94-25277# Technische Univ., Eindhoven (Netherlands).
INTRODUCTION TO A BEHAVIORAL APPROACH FOR CONTINUOUS TIME SYSTEMS Ph.D. Thesis
Johannes Maria Soethoudt 1993 173 p
(ETN-94-95301) Avail: CASI HC A08/MF A02

An approach to find necessary and sufficient conditions for a continuous time dynamical system to satisfy an AR-relation is presented. Frechet spaces and their duals are introduced. Some properties of Fourier transform, defined in several spaces, are presented. The translation-invariant operators are characterized. The statement that all intrinsic properties of a behavior B are present in its restriction B(sup infinity) to C(sup infinity) (R, (R sup g)) is made. The AR-descriptions for systems consisting of C(R)-signals are discussed. The case of C(sup(-k)) spaces is analyzed. A new chain of Frechet spaces that can be used to interpret differential equations in case the signals are not differentiable is presented. The way the results can be generalized to other Frechet spaces is indicated. ESA

N94-25306# Sheffield Univ. (England). Dept. of Automatic Control and Systems Engineering.
APPROXIMATION TO NONLINEAR EQUATIONS USING NONLINEAR RATIONAL MODELS
Q. M. Zhu and S. A. Billings Aug. 1992 24 p
(Grant SERC-GR/F-2417.7)
(RR-448; ETN-94-95128) Avail: CASI HC A03/MF A01

The feasibility of approximating several nonlinear dynamic equations which dominate several engineering disciplines is investigated. A nonlinear rational model formulation is used. The purpose is to describe typical nonlinear stochastic dynamics in engineering systems. The studies are based on identification from input and output data rather than analytical transformation from a nonlinear equation to a nonlinear rational model. The results show that the rational model can be used to approximate discontinuous nonlinear elements. ESA

N94-25309 Sheffield Univ. (England). Dept. of Automatic Control and Systems Engineering.
FIXED POINTS AND SHIFT CYCLES IN CELLULAR AUTOMATA
S. P. Banks and S. Djirar Sep. 1992 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(RR-459; ETN-94-95131) Avail: CASI HC A03

A technique for determining fixed points and shift cycles in one and two dimensional cellular automata based on graph theory is given. The technique uses the theory of graphs and applies to both one and two dimensional systems. The method produces an easily computable result to be implemented on a computer. Graphs as finite state machines were used in the computation theory of cellular automata, but not for detecting fixed points. One dimensional problems for a rule of any length and the case of a 5 bit two dimensional rule with periodic boundary conditions are considered. ESA

N94-25310# Sheffield Univ. (England). Dept. of Automatic Control and Systems Engineering.
ON THE INVERSION OF THE n-DIMENSIONAL LAPLACE TRANSFORM
S. P. Banks and A. Moser Sep. 1992 26 p
(RR-461; ETN-94-95132) Avail: CASI HC A03/MF A01

The inversion of the multidimensional Laplace transform by a combination of a general partial fraction expansion formula and the theory of residues is studied. The ideas may be applied to nonlinear systems defined by the Volterra series. The main objective is to develop a generalization of the ordinary one dimensional Laplace transform theory to the n dimensional case. This involves a generalized partial fraction expansion theory using the techniques of ideal theory. The theory of residues is applied to compute the inverse transforms of the resulting quotient forms in which the denominators are irreducible polynomials in C(sup n)(X) to emphasize the connection with the Laplace variables. ESA

N94-25318# Sheffield Univ. (England). Dept. of Automatic Control and Systems Engineering.
FREQUENCY RESPONSE FUNCTIONS FOR NONLINEAR RATIONAL MODELS
H. Zhang, S. A. Billings, and Q. M. Zhu 16 Mar. 1993 32 p
(Grant SERC-GR/F-8564.2)
(RR-471; ETN-94-95138) Avail: CASI HC A03/MF A01

A recursive algorithm defined as the ratio of two polynomial functions is derived using the harmonic expansion method. The algorithm maps a general class of nonlinear rational model into the frequency domain. The algebric expression enables the frequency response behavior to be related to the structure and parameters of the corresponding time domain model. The new algorithm provides a direct analytic map from the time domain rational model parameters to the higher order frequency response functions. Complex nonlinear time domain behaviors can be analyzed and interpreted in the frequency domain. Examples to illustrate the concepts involved are included. ESA

N94-25320# Sheffield Univ. (England). Dept. of Automatic Control and Systems Engineering.
RELATIONSHIP BETWEEN THE STRUCTURE AND PERFORMANCE OF IDENTIFIED NONLINEAR POLYNOMIAL MODELS
L. A. Aguirre and S. A. Billings May 1993 60 p
(Grants CNPq-200597/90-6; SERC-GR/H-35286)
(RR-474; ETN-94-95140) Avail: CASI HC A04/MF A01

The effect of the structure of identified nonlinear polynomial models on the dynamical behavior of such models is investigated. The effects of the sampling rate, the number of process terms and the order of the models are studied and input design is considered. Bifurcation diagrams and Poincare sections are used. The identified models were estimated from data generated by the Duffing-Ueda equation. The identified models are compared to the original system over a wide range of parameter values for which the Duffing-Ueda equation exhibits regular oscillations, period doubling cascades, pitchfork bifurcations, and chaos. ESA

THE CASIMIR ENERGY OF THE RIGID STRING WITH MASSIVE ENDS
V. V. Nesterenko and N. R. Shvets 1991 16 p Submitted for publication
(DE93-616851; JINR-E-2-91-566) Avail: CASI HC A03/MF A01 (US Sales Only)

The Casimir energy in the rigid string with massive ends is investigated. This system models the flux tube of finite thickness that connects the massive quarks. The string and quark mass give additive contributions to the Casimir energy, the second contribution being the same as in the Nambu-Goto string with massive ends. The string hardness results in an additional positive contribution to the Casimir energy, however, it alone does not compensate the negative Casimir energy in the Nambu-Goto string. Only common consideration of the string thickness and the quark mass enables one to get the positive Casimir energy, i.e. to remove the tachyon from the string spectrum. DOE

EDGE DETECTION USING A COMPLEX WAVELET
Richard A. Hevenor and Eugene A. Margerum Dec. 1993 10 p
(AD-A273699; TEC-R-200) Avail: CASI HC A02/MF A01

A complex wavelet of the form Psi(x, y) = C(x jy)exp(-p(x-sq + y-sq)) wavelet transform to obtain edges from a digital image in two orthogonal directions. In the above equation Psi(x, y) is a two dimensional complex wavelet, C and p are constants, j is the square root of -1, and x and y are position variables. The square root of the sum of the squares of the real and imaginary parts of the wavelet transform are used to find the edges in an arbitrary direction. Theoretical models are derived for the cases of a step edge and a ramp edge. The computer implementation of the wavelet edge detector involves the creation of two masks; one for the real part and one for the imaginary part. An expression is derived for the size of the edge masks using the inflection points of a curve derived from the wavelet. Finally, the edge detector is applied to two synthetic aperture radar images and the resulting images are shown. DTIC

A REACHABILITY TEST FOR SYSTEMS OVER POLYNOMIAL RINGS USING GROEBNER BASES
L. C. G. J. M. Habets 8 Sep. 1992 23 p Submitted for publication Sponsored by Netherlands Organization for Scientific Research
(MEMO-COSOR-92-38; ETN-94-94799; PB94-126588) Avail: CASI HC A03/MF A01

The conditions for the reachability of a system over a polynomial ring are verified. It is shown how the Groebner bases method makes it possible to carry out the test. The algorithm presented has the advantage of a good performance of both reachable and non-reachable systems. The method can be used to obtain a right or left inverse of a general non-square polynomial matrix. Such inverse matrices are often required for the design of feedback compensators. A modification of the reachability test is given to speed up the computations in the non-reachable case. The concept of reachability and the conditions under which a system over a polynomial ring is reachable are reviewed. It is shown how the reachability test can be speeded up by applying the algorithm recursively. The effectiveness of the proposed methods is illustrated. ESA

ON SOME APPROXIMATELY BALANCED COMBINATORIAL COOPERATIVE GAMES
U. Faigle and W. Kern Feb. 1993 16 p
(MEMO-1113; ETN-94-94750) Avail: CASI HC A03/MF A01

A model of taxation for cooperative n person games is introduced where proper coalitions are taxed proportionally to their value. Games with non empty core under taxation at rate epsilon are epsilon balanced. Sharp bounds on epsilon in matching games on (not necessarily bipartite) graphs are established. Upper and lower bounds on the best epsilon in bin packing games are derived and euclidean random traveling salesman problem games are seen to be, with high probability, epsilon balanced for epsilon approximately equal to 0.06. LOSS PROBABILITIES IN BATCH-ARRIVAL BULK-SERVICE QUEUES WITH FINITE CAPACITY
J. C. W. vanOmmeren Dec. 1992 11 p
(MEMO-1106; ETN-94-94742) Avail: CASI HC A03/MF A01

Buffer overflow is an important problem in communication and production systems. For the case where batches arrive according to a Poisson process and the service is in geometrically distributed batches, a method to find the exact loss probability is derived. An asymptotic approximation for the loss probability is also derived. Numerical experiments indicate that the buffer sizes needed to achieve a specified loss probability increase when the expected service batch size increases and the offered load is kept constant. ESA

ON NON-INFORMATIVENESS IN A CLASSICAL BAYESIAN INFERENCE PROBLEM

F. P. A. Coolen Sep. 1992 16 p

(MEMO-COSOR-92-35; ETN-94-94796) Avail: CASI HC A03/MF A01

Not only between frequentists and Bayesians, but also among Bayesians, there is discrepancy on the answer of the essential question: given s successes in n previous trials, what is the probability of success at the next trial (all trials identical and independent). The Bayesian answer to this problem is discussed considering noninformative prior subjective data. Paradoxes related to this problem are discussed. The actual paradox seems to be that the feeling about using subjective information additional to real data that have become available depends on these data, which is not allowed in the Bayesian framework. ESA

SUBSET SELECTION FOR THE BEST OF TWO POPULATIONS: TABLES OF THE EXPECTED SUBSET SIZE

Paul vanderLaan and Constance vanEeden (British Columbia Univ., Vancouver.) Jan. 1993 19 p

(PB93-237857; MEMO-COSOR-93-01) Avail: CASI HC A03/MF A01

Assume two independent populations are given. The associated independent random variables have Normal distributions with unknown expectations theta (1) and theta (2), respectively, and known common variance sigma(squared). The selection goal of Gupta's subset selection for two populations is to select a non-empty subset which contains the best, in the sense of largest expectation, population with confidence level P*(1/2 less than P* less than 1). In Van der Laan and Van Eeden, a generalized selection goal has been introduced and investigated. In the report, extended tables with values of the expected subset size are given. NTIS

MEAN-VALUE OF PRODUCT-FORM STOCHASTIC PETRI NET MODELS OF SLOTTED-RING SYSTEMS

A. J. Coyle (Adelaide Univ., Australia.), B. R. Haverkort, W. Henderson (Adelaide Univ., Australia.), and C. E. M. Pearce (Adelaide Univ., Australia.) 1993 27 p

(PB94-110871; TIOS-93/22) Copyright Avail: CASI HC A03/MF A01

The paper offers a mean-value analysis (MVA) approach for the solution of product-form stochastic Petri net models of slotted-ring systems. It presents the exact product form solution, and from that, develops the MVA recursion scheme. The presented MVA allows for the movement of batches of customers rather than just individual customers, as is the case in the traditional MVA schemes. Furthermore, the MVA allows for non-disjoint place invariants whereas previous MVA schemes always addressed only disjoint ones. Apart from the MVA recursive relations, it gives details on the implementation of these relations. The advantage of an MVA approach is that it usually allows for much larger models to be solved than the usual numerical solution based on the global balance equations would. The MVA is demonstrated by the analysis of a number of fairly large models for slotted-ring systems. NTIS

ASYMPTOTIC CONFIDENCE INTERVALS FOR THE LENGTH OF THE SHORTT UNDER RANDOM CENSORING

Jan Beirlant and John H. J. Einmahl Feb. 1993 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(PB93-237816; MEMO-COSOR-93-03) Avail: Issuing Activity (National Technical Information Service (NTIS))

A shortt of a one dimensional probability distribution is defined to be an interval which has at least probability t and minimal length. The length of a shortt and its obvious estimator are significant measures of scale of a distribution and the corresponding random sample, respectively. In this note, a non-parametric asymptotic confidence interval for the length of the (uniqueness is assumed) shortt is established in the random censorship from the right model. The estimator of the length of the shortt is based on the product-limit (PL) estimator of the unknown distribution function. The proof of the result mainly follows from an appropriate combination of the Glivenko-Cantelli theorem and the functional central limit theorem for the PL estimator. NTIS

SUBSET SELECTION WITH A GENERALIZED SELECTION GOAL BASED ON A LOSS FUNCTION

Paul vanDerLaan and Constance vanEeden (British Columbia Univ., Vancouver.) Jun. 1993 27 p Limited Reproducibility: More than 20% of this document may be affected by poor print and microfiche quality

(PB94-111192; MEMO-COSOR-93-15) Avail: Issuing Activity (National Technical Information Service (NTIS))

Assume k (integer k greater than or equal to 2) populations are given. The associated independent random variables have continuous distribution functions with an unknown location parameter. The selection goal is to select a non-empty subset which contains the best, in the sense of largest location parameter, population with confidence level P* (k(exp -1) less than P* less than 1). In this paper a generalized selection goal based on a general loss function is presented. This new loss function takes into account the difference, in parameter value, between the best population in the selected subset and the best of all k populations minus epsilon (epsilon greater than or equal to 0); it is zero if an epsilon-best population is an element of the subset. An epsilon-best population is any population with a parameter value within epsilon of the value of the largest parameter. The generalized selection goal is thought to be of great value from an application point of view. The subset selection goal of Gupta is a special case of the introduced generalized selection goal. The special case of two normal populations is studied in detail. NTIS

FIRST ORDER CONDITIONS FOR THE MAXIMUM LIKELIHOOD ESTIMATION OF AN EXACT ARMA MODEL

J. vanderLeeuw 1993 31 p See also PB93-138014 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(PB94-110533; FEW-611) Avail: Issuing Activity (National Technical Information Service (NTIS))

Using the exact covariance matrix of ARMA(p,q) errors, first order conditions for the parameters are derived and solved. This is done for the pure MA case, the pure AR case and the general ARMA model. The approach applies both to maximum likelihood and minimum distance estimation. The exact covariance is written in the form of lag matrices, which can simply be differentiated. The resulting first order conditions have at least one solution. The difference between maximum likelihood and minimum distance estimation amounts to a function of the elements of the covariance matrix. This function is simple in case of the pure MA or AR case, but more complicated in the general ARMA case. Of course, the solution for the AR and MA parameters are in general conditional. Only in the pure MA and AR case of a time series model without explanatory variables direct solutions are found. NTIS

INFINITE DIVISIBLE AND STABLE DISTRIBUTIONS MODULO 1

R. J. G. Wilms Jul. 1993 26 p See also N92-20184 and PB93-237824

(PB94-110640; MEMO-COSOR-93-22) Avail: CASI HC A03/MF A01

In his 1983 paper, Schatte studied infinite divisibility modulo 2pi (mod 2pi). He gave a representation theorem for infinite divisible (infdiv) (mod 2pi) Fourier-Stieltjes Sequences (FSS's) and a limit theorem for sequences of infdiv (mod 2pi) FSS's. Furthermore, under an infinite smallness (mod 2pi) condition he considered convergence of sums to infdiv (mod 2pi) distributions. We consider distributions modulo 1 (mod 1). In Section 2, we give some notations, definitions, and properties of FSS's, and in Section 3 we reformulate Schatte's results for infdiv (mod 1) distributions. From Schatte's representation, we deduce in Section 4 two other representations: one similar to the Levy-Khinchine canonical form, and the other to the Kilmogorov canonical form. In addition, we give a new characterization of infdiv (mod 1) distributions and characterize these distributions in two theorems. Finally, in Section 6, we generalize a limit theorem proved by Schatte. NTIS

BOUNDS AND ASYMPTOTIC EXPANSIONS FOR SOLUTIONS OF THE FREE BOUNDARY PROBLEMS RELATED TO SEQUENTIAL DECISION VERSIONS OF A BIOEQUIVALENCE PROBLEM

John Bather and Herman Chernoff 23 Nov. 1993 58 p

(Contract N00014-91-J-1005)

(AD-A273551; TR-ONR-C-15) Avail: CASI HC A04/MF A01

The numerical solutions of two related variations of a sequential version of a form of the bioequivalence problem was presented in a report by Hwang. In that report he referred to our unpublished results bounding the solutions and providing asymptotic expansions. The present report has two major functions. One is to derive and amplify these results, and incidentally to correct an error. The second is to gather together in one place, and with relatively little of the abbreviation characteristics of previous publications, many of the details that are useful in deriving the asymptotic expansions. In Hwang's report he presented the Bayesian decision theoretic approach in which the problem is related to a stopping problem involving Brownian motion, a stopping cost represented by a single cost parameter c, and an initial point (y,s) depending on the prior normal distribution of an unknown parameter and other known parameters of the problem. The solution of the problem is represented by dividing up the set ((y,s):s greater than 0) into a continuation set C and a stopping set S. DTIC

TWO-STAGE VERSUS SEQUENTIAL SAMPLE-SIZE DETERMINATION IN REGRESSION ANALYSIS OF SIMULATION EXPERIMENTS

Jack P. C. Kleijnen and Willem vanGroenendaal 1993 38 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(PB94-110558; FEW-572) Avail: Issuing Activity (National Technical Information Service (NTIS))

In practice, simulation models usually have responses with variances that vary with the inputs. Then the number of observations (also called simulation runs or replications) per combination of simulation inputs can be selected such that the variances of the average simulation responses become (approximately) equal; in other words, combinations with high variability are replicated more often. These average responses can be analyzed through a regression metamodel. To estimate the regression parameters (or simulation input effects), Weighted Least Squares (WLS) can be applied. WLS becomes identical to Ordinary Least Squares (OLS) applied to the average simulation responses. Because the response variances are unknown, they are estimated by repeating the simulation runs with different random numbers. The estimated response variances yield the number of runs required to obtain approximately equal variances per average simulation response. Two rules for selecting the required number of simulation runs are presented, namely a two-stage and a sequential rule. The rules are first formalized and analyzed, and then evaluated through a Monte Carlo experiment. Both procedures turn out to yield confidence intervals for the estimated regression parameters that have acceptable coverage probabilities. NTIS

RAO-BLACKWELL THEOREM IN STEREOLOGY AND SOME COUNTEREXAMPLES
A. J. Baddeley (Center for Mathematics and Computer Science, Amsterdam, Netherlands.) and L. M. Cruz-Orive (Bern Univ., Switzerland.) 1993 21 p Sponsored by Schweizerischer Nationalfonds zur Foerderung der Wissenschaftlichen Forschung Limited Reproducibility: More than 20% of this document may be affected by poor print and microfiche quality
(PB94-111713; TW-93-07) Avail: Issuing Activity (National Technical Information Service (NTIS))

A version of the Rao-Blackwell theorem is shown to apply to most, but not all, stereological sampling designs. Estimators based on random test grids typically have larger variance than quadrat estimators; random s-dimensional samples are worse than random r-dimensional samples for s less than r. Furthermore, the standard stereological ratio estimators of different dimensions are canonically related to each other by the Rao-Blackwell process. However, there are realistic cases where sampling with a lower-dimensional probe increases efficiency. For example, estimators based on (conditionally) non-randomized test point grids may have smaller variance than quadrat estimators. Relative efficiency is related to issues in geostatistics and the theory of wide-sense stationary random fields. NTIS

GENERAL OPTIMAL STOPPING THEOREMS FOR SEMI-MARKOV PROCESSES
Jose M. Gouweleeuw and Frans A. Boshuizen (Erasmus Univ., Rotterdam, Netherlands.) Dec. 1992 33 p Prepared in cooperation with Erasmus Univ. Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-214989; WS-406) Avail: Issuing Activity (National Technical Information Service (NTIS))

Optimal stopping problems for semi-Markov processes are studied in a fairly general setting. In such a process, transitions are made from state to state in accordance with a Markov chain, but the amount of time spent in each state is random. The times spent in each state follow a general renewal process. They may depend on the present state as well as on the state into which the next transition is made. The goal is to maximize the net return, which is given as a function of the state at time t minus some cost function. Discounting may or may not be considered. The main theorems (Theorem 3.3 and 3.10) are expressions for the optimal stopping time in the undiscounted and discounted case. These theorems generalize results of Zuckerman, and Boshuizen and Gouweleeuw. Applications are given in various special cases. The results developed in this paper can also be applied to semi-Markov shock models, as considered in papers by Taylor, Feldman, and Zuckerman. NTIS

EVOLVING RECURRENT PERCEPTRONS Professional Paper
John R. McDonnell and Don Waagen Oct. 1993 14 p
(AD-A273241) Avail: CASI HC A03/MF A01

This work investigates the application of evolutionary programming, a multi-agent stochastic search technique, to the generation of recurrent perceptrons (nonlinear IIR filters) for time-series prediction tasks. The evolutionary programming paradigm is discussed and analogies are made to classical stochastic optimization methods. A hybrid optimization scheme is proposed based on multi-agent and single-agent random optimization techniques. This method is then used to determine both the model order and weight coefficients of linear, nonlinear, and parallel linear-nonlinear next-step predictors. The AIC is used as the cost function to score each candidate solution. DTIC

CORRELATION FUNCTION ESTIMATOR PERFORMANCE IN NON-GAUSSIAN SPHERICALLY INVARIANT RANDOM PROCESSES
James H. Michels Oct. 1993 32 p
(AF Proj. 2304)
(AD-A273498; RL-TR-93-179) Avail: CASI HC A03/MF A01

In this report, analytic expressions are developed for the variance, error variance, and bias of the time-averaged correlation function estimator for stationary, discrete, non-Gaussian complex processes. The expressions derived here pertain to the general class of non-Gaussian processes known as Spherically Invariant Random Processes (SIRP's). Specific results are shown for K-distributed processes which form a special case of the SIRP's. Furthermore, these equations are derived for the general case of processes with unconstrained quadrature components; i.e., for processes exhibiting elliptical symmetry. For the special case of complex processes with constrained correlation between the quadrature components (i.e., circular symmetry), the resulting analytic expressions attain a simplified form. Validity of the analytic expressions is presented using Monte-Carlo simulations. DTIC

SOLVING THE RANKING AND SELECTION INDIFFERENCE-ZONE FORMULATION FOR NORMAL DISTRIBUTIONS USING COMPUTER SOFTWARE M.S. Thesis
Catherine A. Poston Dec. 1993 135 p
(AD-A273821; AFIT/GSO/ENS/ENC/93D-12) Avail: CASI HC A07/MF A02

Ranking and selection procedures are statistical methods used to compare and choose the best among a group of similar statistically distributed populations. The two predominant approaches to solving ranking and selection problems are Gupta's subset selection formulation and Bechhofer's indifference-zone formulation. For the indifference-zone formulation where the populations have equal sample sizes, Barr and Rizvi developed an integral expression of the probability of correct selection (PCS). Given appropriate parameters, the integral expression can be solved to determine the common sample size required to attain a desired PCS. Tables with selected solutions to the integral expression are available for a variety of population distributions. These tables, however, are not included in any single reference, sometimes require interpolation, and only provide approximate results for the case of unequal sample sizes. Using a computer software program to solve the integral expression for the unknown parameters can eliminate these burdens. This paper describes the computer software developed to solve the integral expression of the indifference-zone formulation for normally distributed populations having either equal or unequal sample sizes, The software was written in QuickBASIC and Mathematica. The QuickBASIC code is a menu-driven interface that develops input files for Mathematica. Mathematica is the mathematical software package which performs the computationally intensive calculations required to solve the integral expressions. DTIC

ON FINDING OPTIMAL POLICIES FOR MARKOV DECISION CHAINS: A UNIFYING FRAMEWORK FOR MEAN-VARIANCE-TRADEOFFS
Ying Huang and L. C. M. Kallenberg 1992 23 p Revised Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(TW-92-13; TW-90-10; ETN-94-94831) Avail: CASI HC A03

The existence of optimal policies for maximum one period mean to standard deviation ratio, negative variance with bounded mean and mean penalized by variance Markov decision chains is proven. The chains are reduced to a related mathematical program. This program entails maximizing (xB/D(xb)) + C(xb) over x in a polytope and with given bounds on xb where C and D are convex and either D is constant or D is positive and nondecreasing, C is nondecreasing and xB is nonpositive. This program is reduced to maximizing x(B + theta(b)) over x in the polytope parametrically in theta. Under the nonnegative initial distribution assumption, the rule of constructing a stationary maximum average reward policy from an extreme optimal solution of the associated linear program is generalized. Formulations and existence results for problems discussed by other authors are unified and extended. A computational procedure to solve them, related to another method, is given. ESA

GENERALIZED CONCAVITY IN COOPERATIVE GAME THEORY: CHARACTERIZATIONS IN TERMS OF THE CORE
Theo S. H. Driessen Mar. 1993 20 p Presented at the 4th International Workshop on Generalized Convexity, Pecs, Hungary, 31 Aug. - 2 Sep. 1992
(MEMO-1121; ETN-94-94756) Avail: CASI HC A03/MF A01

A notion of generalized concavity, called k concavity, for cooperative n person cost games is introduced. The k concavity of a cost game is shown to fully characterize the structure of the core of the game and vice versa. The first characterization states that for the k concavity of an n person cost game it is both necessary and sufficient that all the (((n - k) factorial) to the minus 1st power)n factorial so called marginal cost allocations belong to the core of the game. The second characterization states that a cost game is k concave if and only if the core of the game coincides with the specific core catcher, that is the convex hull of the set of all marginal cost allocations in the game. The notion of k concave n person games is illustrated by three examples: the airport game, the location game, and the carpooling game. ESA

ON THE REDUCED GAME PROPERTY FOR AND THE AXIOMATIZATION OF THE TAU-VALUE
Theo S. H. Driessen Mar. 1993 16 p
(MEMO-1128; ETN-94-94764) Avail: CASI HC A03/MF A01

The tau value is a one point solution concept for cooperative games in characteristic function form. A particular type of reduced games is introduced. It is established that the tau value possesses the reduced game property with respect to the reduced game presented. That is, there is no inconsistency in what the players of the reduced game receive, either in the original game or in the reduced game, according to the tau value concept. An axiomatic characterization of the tau value is provided by means of the relevant reduced game property. ESA

STRUCTURED CONSTRAINT SATISFACTION
Z. Ruttkay Dec. 1992 52 p See also PB94-119047
(PB94-119039; IR-316) Avail: CASI HC A04/MF A01

In this report, generalization of the traditional constraint satisfaction problem, the so-called structured constraint satisfaction problem (SCSP) is dealt with: we consider a set of CSPs at the same time, and are aiming at finding a solution for any of the given problems. The set CSPs to be considered are gained by structuring an initially given set of constraints. Boolean, hierarchical, and partial constraint satisfaction problems can be formulated as SCSPs with an appropriate structuring. From the point of view of modeling real problems, an SCSP model is more expressive than a traditional CSP. In addition, by allowing SCSPs some pragmatic drawbacks due to the difficulty of CSP solving may be avoided. For solving a SCSP, the generic scheme of alternating search is proposed, containing alternating steps to generate a traditional CSP and to find a solution of it. We identify the generic tasks of solving SCSPs; we outline different strategies to co-ordinate the alternating search, and discuss measures which can be used to guide the search in the two individual search spaces. EGALITARIAN NON-AVERAGE CONTRIBUTION METHOD FOR COOPERATIVE GAMES
T. S. H. Driessen and Y. Funaki Jun. 1993 19 p See also N89-23266 Limited Reproducibility: More than 20% of this document may be affected by poor print and microfiche quality
(PB94-111705; MEMO-1135) Avail: Issuing Activity (National Technical Information Service (NTIS))

The first topic is the introduction of a new solution concept for cooperative games, called egalitarian non-average contribution (ENAC) method. The method is based on the egalitarian allocation of the amount that is left of the total profits after each player has already been paid his average contribution. The average contribution of a player represents an average of his part of the joint contribution of any two-person coalition including himself. In addition, the average contribution of any player can be interpreted as an upper core bound derived from the (n - 2)-person coalitions in an n-person game. The second topic is the study of several conditions which are sufficient for the coincidence of the ENAC-solution and the prenucleolus. The main sufficient condition requires that the maximal excesses at the ENAC-solution of an n-person game are determined by the (n - 2)-person coalitions. NTIS

SPACEOPS 1992: PROCEEDINGS OF THE SECOND INTERNATIONAL SYMPOSIUM ON GROUND DATA SYSTEMS FOR SPACE MISSION OPERATIONS
1 Mar. 1993 869 p Symposium held in Pasadena, CA, 16-20 Nov. 1992
(Contract NAS7-918)
(NASA-CR-194486; JPL-Publ-93-5; NAS 1.26:194486) Avail: CASI HC A99/MF A10

The Second International Symposium featured 135 oral presentations in these 12 categories: Future Missions and Operations; System-Level Architectures; Mission-Specific Systems; Mission and Science Planning and Sequencing; Mission Control; Operations Automation and Emerging Technologies; Data Acquisition; Navigation; Operations Support Services;

Engineering Data Analysis of Space Vehicle and Ground Systems; Telemetry Processing, Mission Data Management, and Data Archiving; and Operations Management. Topics focused on improvements in the productivity, effectiveness, efficiency, and quality of mission operations, ground systems, and data acquisition. Also emphasized were accomplishments in management of human factors; use of information systems to improve data retrieval, reporting, and archiving; design and implementation of logistics support for mission operations; and the use of telescience and teleoperations. For individual titles, see N94-23833 through N94-23968.

A new vision has emerged within the Office of Space Science and Applications (OSSA), and within the agency as a whole, for how to design missions to be responsive to the changing budget environment of the 1990s. The overall space science and applications program had to be looked at, restructuring the most expensive and complex projects to bring down costs and ensure their place in the mission queue of the future. The recent restructuring of some of OSSA's largest programs in development and the work to improve efficiency for those in operation is part of OSSA's effort to free funds for more frequent space science missions in the future. Instead of more great observatories, we are looking toward a new vision encompassing a level of great activity through small, frequent missions. The strategy developed for attaining this vision was to lower costs by reducing size and complexity through new technology, while at the same time making progress in space science. The strategy comprises two interwoven parts: the flight program strategy of each of the science disciplines and OSSA's new-technology strategy. The overall purpose of all OSSA's efforts to date has been to free resources for maximizing the space science program in a tough fiscal environment. Derived from text

COMMONALITY OF FLIGHT CONTROL SYSTEMS FOR SUPPORT OF EUROPEAN TELECOMMUNICATIONS MISSIONS c32
Kurt Debatin *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 7-14 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

This paper is concerned with the presentation of mission-independent software systems that provide a common software platform to ground data systems for mission operations. The objectives of such common software platforms are to reduce the cost of the development of mission-dedicated software systems and to increase the level of reliability of the ground data systems for mission operations. In accordance with this objective, the Multi-Satellite Support System (MSSS) was developed at the European Space Operations Center (ESOC). Between 1975 and 1992, the MSSS provided support to 16 European Space Agency (ESA) missions, among them very demanding science missions such as GEOS, EXOSAT, and Giotto. The successful support of these missions proved the validity of the MSSS concept with its extended mission-independent platform. This paper describes the MSSS concept and focuses on the wide use of MSSS as a flight control system for geosynchronous telecommunications satellites. Reference is made to more than 15 telecommunications missions that are operated from Western Europe using flight control systems with an underlying MSSS concept, demonstrating the benefits of a commonly used software platform. Finally, the paper outlines the design of the new generation of flight control systems, which is being developed at ESOC for this decade, following a period of more than 15 years of MSSS support.

NASDA'S VIEW OF GROUND CONTROL IN MISSION OPERATIONS c32
Satoshi Tateno *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 15-20 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

This paper presents an overview of the present status and future plans of the National Space Development Agency of Japan 's (NASDA's) ground segment and related space missions. The described ground segment consists of the tracking and data acquisition (T&DA) system and the Earth Observation Center (EOC) system. In addition to these systems, the current plan of the Engineering Support Center (ESC) for the Japanese Experiment Module (JEM) attached to Space Station Freedom is introduced. Then, NASDA's fundamental point of view on the future trend of operations and technologies in the coming new space era is discussed. Within the discussion, the increasing importance of international cooperation is also mentioned.

It is a great privilege for me to address my colleagues at SpaceOps 92. Today, I would like to share with you some current directions we are pursuing in NASA's Office of Space Communications (OSC). The space agencies of the world have produced some remarkable achievements in conducting our missions. It is also true that we consume significant resources in controlling and operating our spacecraft. In these challenging economic times, the degree to which our agencies can develop new missions will depend on our ability to reduce operating costs. I believe that there are many opportunities for doing this, and I will explore some of our plans in this regard. First, I will review the business of space operations.

COMMON FRONT END SYSTEMS FOR SPACE SHUTTLE AND SPACE STATION CONTROL CENTERS AT JOHNSON SPACE CENTER c32
Linda Uljon and John Muratore *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 33-38 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

In the beginning of the fiscal year 1992, the development organizations of Johnson Space Center (JSC) were poised to begin two major projects: the Space Station Control Center and the refurbishment of the telemetry processing area of the Space Shuttle Mission Control Center. A study team established that a common front end concept could be used and could reduce development costs for both projects. A standard processor was defined to support most of the front end functions of both control centers and supports a consolidation of control positions which effectively reduces operations cost. This paper defines that common concept and describes the progress that has been made in development of the Consolidated Communications Facility (CCF) during the past year.

MISSION OPERATIONS UPDATE FOR THE RESTRUCTURED EARTH OBSERVING SYSTEM (EOS) MISSION

Angelita Castro Kelly and Edward S. Chang *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 39-44 (For primary document see N94-23832 06-66)

Avail: CASI HC A02/MF A10

The National Aeronautics and Space Administration's (NASA) Earth Observing System (EOS) will provide a comprehensive long term set of observations of the Earth to the Earth science research community. The data will aid in determining global changes caused both naturally and through human interaction. Understanding man's impact on the global environment will allow sound policy decisions to be made to protect our future. EOS is a major component of the Mission to Planet Earth program, which is NASA's contribution to the U.S. Global Change Research Program. EOS consists of numerous instruments on multiple spacecraft and a distributed ground system. The EOS Data and Information System (EOSDIS) is the major ground system developed to support EOS. The EOSDIS will provide EOS spacecraft command and control, data processing, product generation, and data archival and distribution services for EOS spacecraft. Data from EOS instruments on other Earth science missions (e.g., Tropical Rainfall Measuring Mission (TRMM)) will also be processed, distributed, and archived in EOSDIS. The U.S. and various International Partners (IP) (e.g., the European Space Agency (ESA), the Ministry of International Trade and Industry (MITI) of Japan, and the Canadian Space Agency (CSA)) participate in and contribute to the international EOS program. The EOSDIS will also archive processed data from other designated NASA Earth science missions (e.g., UARS) that are under the broad umbrella of Mission to Planet Earth. Derived from text

ASTER, A MULTINATIONAL EARTH OBSERVING CONCEPT c43

Graham W. Bothwell, Gary N. Geller, Steven A. Larson, Andrew D. Morrison, and David A. Nichols *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 45-50 (For primary document see N94-23832 06-66)

Avail: CASI HC A02/MF A10

The Advanced Spaceborne Thermal Emission and Reflection Radiometer (ASTER) is a facility instrument selected for launch in 1998 on the first in a series of spacecraft for NASA's Earth Observing System (EOS). The ASTER instrument is being sponsored and built in Japan. It is a three telescope, high spatial resolution imaging instrument with 15 spectral bands covering the visible through to the thermal infrared. It will play a significant role within EOS providing geological, biological, land hydrological information necessary for intense study of the Earth. The operational capabilities for ASTER, including the necessary interfaces and operational collaborations between the US and Japanese participants, are under development. EOS operations are the responsibility of the EOS Project at NASA's Goddard Space Flight Center (GSFC). Although the primary EOS control center is at GSFC, the ASTER control facility will be in Japan. Other aspects of ASTER are discussed. Author (revised)

GROUND OPERATION OF ROBOTICS ON SPACE STATION FREEDOM c37

Z. Alex Wojcik, David G. Hunter, and Marc R. Cantin (KEOPS Informatique, Montreal, Quebec.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 51-55 (For primary document see N94-23832 06-66)

Avail: CASI HC A01/MF A10

This paper reflects work carried out on Ground Operated Telerobotics (GOT) in 1992 to refine further the ideas, procedures, and technologies needed to test the procedures in a high latency environment, and to integrate GOT into Space Station Freedom operations. Space Station Freedom (SSF) will be in operation for 30 years, and will depend on robots to carry out a significant part of the assembly, maintenance, and utilization workload. Current plans call for on-orbit robotics to be operated by on-board crew members. This approach implies that on-orbit robotics operations use up considerable crew time, and that these operations cannot be carried out when SSF is unmanned. GOT will allow robotic operations to be operated from the ground, with on-orbit crew interventions only when absolutely required. The paper reviews how GOT would be implemented, how GOT operations would be planned and supported, and reviews GOT issues, critical success factors, and benefits. Author (revised)

MISSION PLANNING FOR SHUTTLE IMAGING RADAR-C (SIR-C) WITH A REAL-TIME INTERACTIVE PLANNING SOFTWARE c32

Su K. Potts *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 57-62 (For primary document see N94-23832 06-66)

Avail: CASI HC A02/MF A10

The Shuttle Imaging Radar-C (SIR-C) mission will operate from the payload bay of the space shuttle for 8 days, gathering Synthetic Aperture Radar (SAR) data over specific sites on the Earth. The short duration of the mission and the requirement for realtime planning offer challenges in mission planning and in the design of the Planning and Analysis Subsystem (PAS). The PAS generates shuttle ephemerides and mission planning data and provides an interactive real-time tool for quick mission replanning. It offers a multi-user and multiprocessing environment, and it is able to keep multiple versions of the mission timeline data while maintaining data integrity and security. Its flexible design allows one software to provide different menu options based on the user's operational function, and makes it easy to tailor the software for other Earth orbiting missions. SAMPEX PAYLOAD OPERATION CONTROL CENTER IMPLEMENTATION c14

Daniel Mandl, Jack Koslosky, Ron Mahmot, Michael Rackley, and Jack Lauderdale (Computer Sciences Corp., Laurel, MD.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 63-68 (For primary document see N94-23832 06-66)

Avail: CASI HC A02/MF A10

The Solar Anomolous and Magnetospheric Explorer (SAMPEX) satellite was launched in July 1992. It was the first in the NASA Small Explorer (SMEX) series. In building the real-time control center facility, several new mission support challenges had to be met: CCSDS telemetry and command format, 900 Kbps telemetry data, and shorter turn-around time for control center development than previous missions. The SAMPEX Payload Operations Control Center (POCC) was also the first control center for a new satellite to be based on the Transportable Payload Operations Control Center (TPOCC) system architecture and methodology. This approach has both guided the implementation of the SAMPEX control center and provided some of the building blocks. By using the TPOCC architecture to build the SAMPEX POCC, the real-time operations area was miniaturized into one room, whereas previous missions needed multiple large rooms. The development cost of the SAMPEX POCC was reduced from previous missions and will provide for further cost savings in the future SMEX satellites. This paper describes the system as built and some of the enhancements in progress to create this teleoperations environment. Author (revised)

DEVELOPMENT OF THE CASSINI GROUND DATA SYSTEM IN A MULTIMISSION ENVIRONMENT
G. Madrid and G. Wanczuk *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 75-80 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

As baselined, the Cassini Ground Data System (GDS) will be composed of Project specific and multimission elements. The former will be developed by the Cassini Project and the latter by two JPL institutional organizations, the Telecommunications and Data Acquisition Office (TDA) and the Multimission Operations Systems Office (MOSO). The GDS will be developed in three principal phases: Spacecraft Test, Launch-cruise, and Science Tour, with a significant part of the development deferred until the post-launch period. New capabilities are being introduced that are key to the achievement of more cost effective operations. Successful development of the system will require careful planning and will involve participation of diverse disciplines. This paper introduces the Cassini Project from the Ground Data System perspective and discusses development approaches expected to produce systems which meet functional and performance requirements and which will be delivered on schedule and within budget. SPOT sun-synchronous remote sensing satellites are operated by CNES since February 1986. Today, the SPOT mission and control center (CCM) operates SPOT1, SPOT2, and is ready to operate SPOT3. During these seven years, the way to operate changed and the CCM, initially designed for the control of one satellite, has been modified and upgraded to support these new operating modes. All these events have shown the performances and the limits of the system. A new generation of satellite (SPOT4) will continue the remote sensing mission during the second half of the 90's. Its design takes into account the experience of the first generation and supports several improvements. A new generation of control center (CMP) has been developed and improves the efficiency, quality, and reliability of the operations. The CMP is designed for operating two satellites at the same time during launching, in-orbit testing, and operating phases. It supports several automatic procedures and improves data retrieval and reporting. Derived from text

A REFERENCE MODEL FOR SPACE DATA SYSTEM INTERCONNECTION SERVICES c32
John Pietras and Gerhard Theis (European Space Agency. European Space Operations Center, Darmstadt, Germany.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 91-96 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The widespread adoption of standard packet-based data communication protocols and services for spaceflight missions provides the foundation for other standard space data handling services. These space data handling services can be defined as increasingly sophisticated processing of data or information received from lower-level services, using a layering approach made famous in the International Organization for Standardization (ISO) Open System Interconnection Reference Model (OSI-RM). The Space Data System Interconnection Reference Model (SDSI-RM) incorporates the conventions of the OSIRM to provide a framework within which a complete set of space data handling services can be defined. The use of the SDSI-RM is illustrated through its application to data handling services and protocols that have been defined by, or are under consideration by, the Consultative Committee for Space Data Systems (CCSDS). AN OSI ARCHITECTURE FOR THE DEEP SPACE NETWORK c32
W. Randy Heuser and Lynne P. Cooper *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 97-101 (For primary document see N94-23832 06-66)
Avail: CASI HC A01/MF A10

The flexibility and robustness of a monitor and control system are a direct result of the underlying inter-processor communications architecture. A new architecture for monitor & Control at the Deep Space Network Communications Complexes has been developed based on the Open System Interconnection (OSI) standards. The suitability of OSI standards for DSN M&C has been proven in the laboratory. The laboratory success has resulted in choosing an OSI-based architecture for DSS-13 M&C. DSS-13 is the DSN experimental station and is not part of the 'operational' DSN; it's role is to provide an environment to test new communications concepts can be tested and conduct unique science experiments. Therefore, DSS-13 must be robust enough to support operational activities, while also being flexible enough to enable experimentation. This paper describes the M&C architecture developed for DSS-13 and the results from system and operational testing. Author (revised)

ATOS-1: DESIGNING THE INFRASTRUCTURE FOR AN ADVANCED SPACECRAFT OPERATIONS SYSTEM c14
K. J. Poulter and H. N. Smith *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 103-112 Prepared in cooperation with Logica Ltd., London, England (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The space industry has identified the need to use artificial intelligence and knowledge based system techniques as integrated, central, symbolic processing components of future mission design, support and operations systems. Various practical and commercial constraints require that off-the-shelf applications, and their knowledge bases, are reused where appropriate and that different mission contractors, potentially using different KBS technologies, can provide application and knowledge sub-modules of an overall integrated system. In order to achieve this integration, which we call knowledge sharing and distributed reasoning, there needs to be agreement on knowledge representations, knowledge interchange-formats, knowledge level communications protocols, and ontology. Research indicates that the latter is most important, providing the applications with a common conceptualization of the domain, in our case spacecraft operations, mission design, and planning. Agreement on ontology permits applications that employ different knowledge representations to interwork through mediators which we refer to as knowledge agents. This creates the illusion of a shared model without the constraints, both technical and commercial, that occur in centralized or uniform architectures. This paper explains how these matters are being addressed within the ATOS program at ESOC, using techniques which draw upon ideas and standards emerging from the DARPA Knowledge Sharing Effort. In particular, we explain how the project is developing an electronic Ontology of Spacecraft Operations and how this can be used as an enabling component within space support systems that employ advanced software engineering. We indicate our hope and expectation that the core ontology developed in ATOS, will permit the full development of standards for such systems throughout the space industry. Author (revised)

DISTRIBUTED SCIENCE OPERATIONS FOR JPL PLANETARY MISSIONS
Richard D. Benson and Peter B. Kahn *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 113-118 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Advances in spacecraft, flight instruments, and ground systems provide an impetus and an opportunity for scientific investigation teams to take direct control of their instruments' operations and data collection while at the same time, providing a cost effective and flexible approach in support of increasingly complex science missions. Operations of science instruments have generally been integrated into planetary flight and ground systems at a very detailed level. That approach has been successful, but the cost of incorporating instrument expertise into the central mission operations system has been high. This paper discusses an approach to simplify planetary science operations by distributing instrument computing and data management tasks from the central mission operations system to each investigator's home center of observational expertise. Some early results of this operations concept will be presented based on the Mars Observer (MO) Project experience and Cassini Project plans. Author (revised)

OPERATIONS CONCEPTS FOR MARS MISSIONS WITH MULTIPLE MOBILE SPACECRAFT
William C. Dias *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 125-130 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Missions are being proposed which involve landing a varying number (anywhere from one to 24) of small mobile spacecraft on Mars. Mission proposals include sample returns, in situ geochemistry and geology, and instrument deployment functions. This paper discusses changes needed in traditional space operations methods for support of rover operations. Relevant differences include more frequent commanding, higher risk acceptance, streamlined procedures, and reliance on additional spacecraft autonomy, advanced fault protection, and prenegotiated decisions. New methods are especially important for missions with several Mars rovers operating concurrently against time limits. This paper also discusses likely mission design limits imposed by operations constraints . Author

Operations concepts are prepared to support a specific application and can, therefore, be classified accordingly. Studies of NASA and military operations concepts suggest three major types: data services, customer services, and systems oriented. Data services concepts concentrate on data types (e.g., telemetry and command) and how these data are processed and delivered to the user. Such concepts are normally used by data-processing centers to describe data-coding schemes and data formats. Customer services concepts concentrate on the customers' requirements and describe how these requirements are met using the systems available to the operation. Project centers use such concepts to describe the various types of data as they flow from the source (e.g., a spacecraft) to the end user (i.e., the customer). Systems oriented concepts concentrate on the use of systems for processing and delivering customer data. This paper examines the latter type and the 'concepts' that are inherent within them. NASDA SATELLITE MISSION OPERATION SYSTEM AND OPERATIONS
Kousaku Yamaya, Fumiyoshi Yoshida, Harushige Noguchi, Tetsuo Takahashi, and Kazuhiro Tanaka *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 137-142 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

NASDA has recently developed a new tracking and control system as a basis for future satellite mission operation. It is named type-I Space Operations and Data Systems (type-I SODS). The software of this system is separated into three parts: operation and control system, network system, and support and information system. The operation control system treats telemetry and command operations. The network system controls the communication line and ground station equipments to connect the satellite and the operation control system. The support and information system provides to other systems necessary information. JERS-1 which was launched in February of this year is the first satellite operated by type-I SODS. We explain the architecture and operation methods of this system using JERS-1 mission operations. Author (revised)

NASA/GODDARD SPACE FLIGHT CENTER'S TESTBED FOR CCSDS COMPATIBLE SYSTEMS **c14**
Richard D. Carper *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 143-148 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

A testbed for flight and ground systems compatible with the Consultative Committee for Space Data Systems (CCSDS) Recommendations has been developed at NASA's Goddard Space Flight Center. The subsystems of an end-to-end CCSDS based data system are being developed. All return link CCSDS telemetry services (except Internet) and both versions of the CCSDS frame formats are being implemented. In key areas of uncertainty, multiple design approaches are being performed. In addition, key flight-qualifiable hardware components, such as Reed-Solomon encoders, are being developed to complement the testbed element development. The testbed and its capabilities are described. The method of dissemination of the testbed results are given, as are plans to make the testbed capabilities available to outside users. Plans for the development of standardized conformance and compatibility tests are provided. Author (revised)

SPOT4 OPERATIONAL CONTROL CENTER (CMP) **c14**
G. Zaouche *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 149-154 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

CNES(F) is responsible for the development of a new generation of Operational Control Center (CMP) which will operate the new heliosynchronous remote sensing satellite (SPOT4). This Operational Control Center takes large benefit from the experience of the first generation of control center and from the recent advances in computer technology and standards. The CMP is designed for operating two satellites all the same time with a reduced pool of controllers. The architecture of this CMP is simple, robust, and flexible, since it is based on powerful distributed workstations interconnected through an Ethernet LAN. The application software uses modern and formal software engineering methods, in order to improve quality and reliability, and facilitate maintenance. This software is table driven so it can be easily adapted to other operational needs. Operation tasks are automated to the maximum extent, so that it could be possible to operate the CMP automatically with very limited human interference for supervision and decision making. This paper provides an overview of the SPOTS mission and associated ground segment. It also details the CMP, its functions, and its software and hardware architecture. Author (revised)

CNES ORGANIZATION FOR STATION POSITIONING OF GEOSTATIONARY SATELLITES
Jean Dulac *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission

Operations 1 Mar. 1993 p 159-163 (For primary document see N94-23832 06-66)
Avail: CASI HC A01/MF A10

Since 1975, the Toulouse Space Centre (a technical establishment of the French Space Agency, CNES) has successfully brought 15 geostationary satellites on to station. During these 17 years of experience, an organization of human and material resources has been built up that ensures a very high level of reliability in the execution of these station positioning operations. The main characteristics of this organization are a rigourous definition of the roles and responsibilities of each person involved, very detailed operations documentation, and methodical preparation of the operations. MISSION ACTIVITIES PLANNING FOR A HERMES MISSION BY MEANS OF AI-TECHNOLOGY
U. Pape, G. Hajen, N. Schielow, P. Mitschdoerfer, and F. Allard (European Space Agency. European Space Research and Technology Center, ESTEC, Noordwijk, Netherlands.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 165-172 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Mission Activities Planning is a complex task to be performed by mission control centers. AI technology can offer attractive solutions to the planning problem. This paper presents the use of a new AI-based Mission Planning System for crew activity planning. Based on a HERMES servicing mission to the COLUMBUS Man Tended Free Flyer (MTFF) with complex time and resource constraints, approximately 2000 activities with 50 different resources have been generated, processed, and planned with parametric variation of operationally sensitive parameters. The architecture, as well as the performance of the mission planning system, is discussed. An outlook to future planning scenarios, the requirements, and how a system like MARS can fulfill those requirements is given. Author (revised)

A QUICK UPLINK, EXPANDABLE EXECUTABLE FOR THE NSSC-1 OF THE HUBBLE SPACE TELESCOPE **c32**
Glenn T. Foley and Elizabeth A. Citrin *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 173-178 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The Hubble Space Telescope, launched in April 1990, contains two primary on-board computers. In the past, modifications to the flight software have been accomplished via patches to the on-board executable image (performed while software is executing) or via halt and reload of the computer memory with a new flight software version. This paper describes a method of reloading flight software with a new software version while continuing the onboard execution of a reduced set of spacecraft payload functions. Author (revised)

GROUND DATA SYSTEM FOR SPACE FLYER UNIT (SFU) **c18**
Takahiro Yamada, Susumu Sasaki, and Keiken Ninomiya *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 179-184 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The Space Flyer Unit (SFU) is an unmanned, multi-purpose, retrievable and reusable space platform. The first mission of SFU (SFU-1) will be launched by NASDA's H-2 launch vehicle in early 1995 and retrieved by NASA's Space Shuttle after several months in orbit. Two Japanese ground stations, several ground stations belonging to NASA, and a ground station in Chile will be used for tracking of SFU-1. The control center of SFU-1 is the Sagamihara Operations Center (SOC) of ISAS located in Sagamihara, Japan. This paper describes the tracking and data acquisition network for SFU-1, the configuration and design policy of the SFU operations control system, and data processing schemes used for mission operations of SFU. RADIOASTRON FLIGHT OPERATIONS
V. I. Altunin (Academy of Sciences, USSR, Moscow.), K. G. Sukhanov (Babakin Engineering and Research Center, Moscow, Russia.), and K. R. Altunin *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 185-190 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Radioastron is a space-based very-long-baseline interferometry (VLBI) mission to be operational in the mid-90's. The spacecraft and space radio telescope (SRT) will be designed, manufactured, and launched by the Russians. The United States is constructing a DSN subnet to be used in conjunction with a Russian subnet for Radioastron SRT science data acquisition, phase link, and spacecraft and science payload health monitoring. Command and control will be performed from a Russian tracking facility. In addition to the flight element, the network of ground radio telescopes which will be performing co-observations with the space telescope are essential to the mission. Observatories in 39 locations around the world are expected to participate in the mission. Some aspects of the mission that have helped shaped the flight operations concept are: separate radio channels will be provided for spacecraft operations and for phase link and science data acquisition; 80-90 percent of the spacecraft operational time will be spent in an autonomous mode; and, mission scheduling must take into account not only spacecraft and science payload constraints, but tracking station and ground observatory availability as well. This paper will describe the flight operations system design for translating the Radioastron science program into spacecraft executed events. Planning for in-orbit checkout and contingency response will also be discussed. Author (revised)

THE ULYSSES SPACECRAFT CONTROL AND MONITORING CONCEPTS AND REALITIES
Paul Hamer and Nigel Angold (European Space Agency. European Space Operations Center, Darmstadt, Germany.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 191-196 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Ulysses is a joint ESA-NASA mission, the primary purpose of the mission is to make scientific measurements of the Sun outside the plane of the ecliptic. The delay in launching Ulysses, due to the Challenger disaster, meant that the hardware on which the Spacecraft Control and Monitoring System (SCMS) resides was becoming obsolete, and it was decided to convert SCMS to run on a DEC/VAX machine under VMS. The paper will cover the spacecraft, the conversion, the converted SCMS, problems found, and the upgrades implemented for solutions. It will also discuss the future for and enhancements already made to the converted SCMS. Author (revised)

GALILEO SPACECRAFT ANOMALY AND SAFING RECOVERY **c18**
Ralph R. Basilio and David M. Durham *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 203-208 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

A high-level anomaly recovery plan which identifies the steps necessary to recover from a spacecraft 'Safing' incident was developed for the Galileo spacecraft prior to launch. Since launch, a total of four in-flight anomalies have lead to entry into a system fault protection 'Safing' routine which has required the Galileo flight team to refine and execute the recovery plan. These failures have allowed the flight team to develop an efficient recovery process when permanent spacecraft capability degradation is minimal and the cause of the anomaly is quickly diagnosed. With this previous recovery experience and the very focused boundary conditions of a specific potential failure, a Gaspra asteroid recovery plan was designed to be implemented in as quickly as forty hours (desired goal). This paper documents the work performed above, however, the Galileo project remains challenged to develop a generic detailed recovery plan which can be implemented in a relatively short time to configure the spacecraft to a nominal state prior to future high priority mission objectives. Author (revised)

MAGELLAN SPACECRAFT AND MEMORY STATE TRACKING: LESSONS LEARNED, FUTURE THOUGHTS **c18**
Allen W. Bucher *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 209-214 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Numerous studies have been dedicated to improving the two main elements of Spacecraft Mission Operations: Command and Telemetry. As a result, not much attention has been given to other tasks that can become tedious, repetitive, and error prone. One such task is Spacecraft and Memory State Tracking, the process by which the status of critical spacecraft components, parameters, and the contents of on-board memory are managed on the ground to maintain knowledge of spacecraft and memory states for future testing, anomaly investigation, and on-board memory reconstruction. The task of Spacecraft and Memory State Tracking has traditionally been a manual task allocated to Mission Operations Procedures. During nominal Mission Operations this job is tedious and error prone. Because the task is not complex and can be accomplished manually, the worth of a sophisticated software tool is often questioned. However, in the event of an anomaly which alters spacecraft components autonomously or a memory anomaly such as a corrupt memory or flight software error, an accurate ground image that can be reconstructed quickly is a priceless commodity. This study explores the process of Spacecraft and Memory State Tracking used by the Magellan Spacecraft Team highlighting its strengths as well as identifying lessons learned during the primary and extended missions, two memory anomalies, and other hardships encountered due to incomplete knowledge of spacecraft states. Ideas for future state tracking tools that require minimal user interaction and are integrated into the Ground Data System will also be discussed.

A REVIEW OF MISSION PLANNING SYSTEMS
M. Jones, E. M. Sorensen, T. Wolff, and C. R. Haddow (Logica Space and Communications Ltd., London, England.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 219-224 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

A general definition of Mission Planning is given. The definition covers the full scope of an end-to-end mission planning system. Noting the mission-specific nature of most mission planning systems, a classification of autonomous spacecraft missions is made into Observatory, Survey, multi-instrument science, and Telecommunications missions. The mission planning approach for one mission in each category is examined critically. The following missions were chosen: ISO (Infrared Space Observatory); ERS-1 (European Remote Sensing Satellite); and Eureca (European Retrievable Carrier). The paper gives a summary of lessons learned from these missions suggesting improvements in areas such as requirements analysis, testing, user interfacing, rules, and constraints handling. The paper will also examine commonalities in functions, which could constitute a basis for identification of generic mission planning support tools.

THE MARS MAPPER SCIENCE AND MISSION PLANNING TOOL
Martin W. Lo *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 225-229 (For primary document see N94-23832 06-66)
Avail: CASI HC A01/MF A10

The Mars Mapper Program (MOm) is an interactive tool for science and mission design developed for the Mars Observer Mission (MO). MOm is a function of the Planning and Sequencing Element of the MO Ground Data System. The primary users of MOm are members of the science and mission planning teams. Using MOm, the user can display digital maps of Mars in various projections and resolutions ranging from 1 to 256 pixels per degree squared. The user can overlay the maps with ground tracks of the MO spacecraft (S/C) and footprints and swaths of the various instruments on-board the S/C. Orbital and instrument geometric parameters can be computed on demand and displayed on the digital map or plotted in XY-plots. The parameter data can also be saved into files for other uses. MOm is divided into 3 major processes: Generator, Mapper, Plotter. The Generator Process is the main control which spawns all other processes. The processes communicate via sockets. At any one time, only 1 copy of MOm may operate on the system. However, up to 5 copies of each of the major processes may be invoked from the Generator. MOm is developed on the Sun SPARCStation 2GX with menu driven graphical user interface (GUI). The map window and its overlays are mouse-sensitized to permit on-demand calculations of various parameters along an orbit. The program is currently under testing and will be delivered to the MO Mission System Configuration Management for distribution to the MO community in 3/93.

MISSION PLANNING FOR AN EARTH OBSERVATION LOW EARTH ORBITER: ERS-1
Paul Lockyer *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 231-236 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

ERS-1, the first European Remote Sensing satellite, has a payload which consists primarily of microwave instruments and is in a polar sun-synchronous orbit. All ground and on-board activities from user requests to delivery of data products are combined into one integrated system. In view of the high number of products which can be generated by ERS-1, the Mission Planning System (MPS), which plans the on-board activities of ERS-1, is an essential tool for operations since manual planning of the large number of daily operations is out of the question. In addition the MPS, in line with the integrated nature of the ERS-1 system, also plans activities at the prime ground station, including among others, the operation of the payload data processing systems there. This paper outlines the operations concepts for ERS-1 mission planning, and describes the Mission Planning System used at the ERS-1 Control Center. Novel functionalities, such as automatic resource clash resolution, are described. A critical discussion gives lessons learned for future mission planning systems.

INTEGRATING PAYLOAD DESIGN, PLANNING, AND CONTROL IN THE DUTCH UTILISATION CENTRE **c18**
T. J. Grant *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 237-242 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Spacecraft payload design, experiment planning and scheduling, and payload control are traditionally separate areas of activity. This paper describes the development of a prototype software tool--the Activity Scheduling System (ASS)--which integrates these activity areas. ASS is part of a larger project to build a Dutch Utilisation Centre (DUC), intended eventually to support all space utilization activities in The Netherlands. ASS has been tested on the High Performance Capillary Electrophoresis payload. The paper outlines the integrated preparation and operations concept embodied in ASS. It describes the ASS prototype, including a typical session. The results of testing are summarized. Possible enhancement of ASS, including integration into DUC, is sketched. Author (revised)

VOYAGER UPLINK PLANNING IN THE INTERSTELLAR MISSION ERA
c32
Susan H. Linick and Kathryn R. Weld *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 243-248 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The Voyager Project has entered its last phase of discovery--the Voyager Interstellar Mission (VIM). Because of the reduced scope of the project and a lower budget, new ways had to be developed to program two spacecraft with fewer people and to allow for some sequence development flexibility without additional risk. In the previous cruise era, it took a seven-person sequence team 12 weeks to develop a nominal eight week cruise sequence. Today it takes a three-person team six weeks to develop a 13 week sequence load. This paper will describe in detail the sequencing strategy which reduces the volume and frequency of sequence loads, and the new tools and processes developed which reduce the manual effort required to generate these sequences without adding risk.

SCIENCE PLANNING AND SEQUENCING FOR CASSINI
Randii R. Wessen and Daniel F. Finnerty *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 249-254 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

This paper will address the science planning and sequencing aspects of the command generation process for the scientifically diverse Cassini Mission. The mission's prime objectives are to study the Saturnian system and deliver the Huygens Probe to the moon Titan. Together, the spacecraft and probe will be the largest and most complicated craft ever launched to another planet. The presentation will begin with an overview of the Cassini spacecraft and its scientific instrumentation. This will be followed with a description of the Oct. 1997 mission. Next, the structure of the science planning and sequencing process, with special emphasis on science's role, will be outlined. Finally, this presentation will conclude with a discussion of some of the unique challenges faced by the Ground System during Cassini's four-year orbital tour. Author (revised)

TECHNIQUES AND SOFTWARE FOR OPTIMUM AND EFFICIENT MISSION SCIENCE SEQUENCE DEVELOPMENT
David A. Bliss *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 255-260 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Highly successful mission operations require efficient and cost-effective science sequence development. Of key importance is the Science Planning and Operations Team's (SPOT's) ability to complete science observation design and integration early in the sequence development process (i.e., before the sequence enters into a formal change control process). Once under formal change control, careful change paper documentation, Flight Team checks, and mission software checks make sequence changes more labor-intensive. This paper discusses team organization, strategies, scheduling, and software employed by the Voyager and Galileo SPOT's to complete science observation design and integration early in the sequence development process. A PACKET-BASED CONCEPT FOR SPACECRAFT COMMAND PLANNING
Valerie B. Barnes *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 261-266 (For primary document see N94-23832 06-66)
(Contract N00039-91-C-0001)
Avail: CASI HC A02/MF A10

The current generation of spacecraft being developed and operated by the Applied Physics Laboratory provides users with access to a broad spectrum of scientific instruments on maneuverable platforms that can be oriented for observation of both moving and stationary targets of interest. The capability of these increasingly complex spacecraft to perform data collection operations is approaching one observation per orbit. To enable both rapid configuration and generation of complex spacecraft command sequences, as well as reusability of command sequences among data collection operations, a packet-based concept for spacecraft command planning has been developed. The configuration of the spacecraft for any operation is designed using 'packets' where a packet represents a set of commands that is reusable. The packets can be combined in varying levels of functionality, and in varying time relationships, to create an observation timeline. At the lowest packet level are primitives. Primitives relate the details of command generation for a particular spacecraft to a 'message template.' Thus the packet concept itself is reusable from one spacecraft to the next. Author (revised)

CONNECTING SCIENCE AND OPERATIONS: THE OPERATIONS COORDINATOR
Madeleine H. Marshall and John A. Landshof *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 267-271 (For primary document see N94-23832 06-66)
Avail: CASI HC A01/MF A10

For a current space mission under development at the Applied Physics Laboratory, the Mission Operations staff includes a team of 'Operations Coordinators' who have been working with the Mission Science and Spacecraft Development teams since completion of mission conceptual design. The Operations Coordinators are responsible for bringing knowledge of the spacecraft to the Mission Science team and bringing knowledge of the experiment requirements to the Spacecraft Development and Mission Operations teams. Once on-orbit operations begin, the Operations Coordinators will be responsible for implementation of specific science experiments from analysis through scheduling, generation of spacecraft command sequences, delivery of science data to the end user, and operations assessment. The Operations Coordinator concept is proving very effective during the development phase of the current mission.

THE INSTANT SEQUENCING TASK: TOWARD CONSTRAINT-CHECKING A COMPLEX SPACECRAFT COMMAND SEQUENCE INTERACTIVELY
Joan C. Horvath, Leon J. Alkalaj, Karl M. Schneider, Arthur V. Amador, and Joseph N. Spitale (California Inst. of Tech., Pasadena.) *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 273-278 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Robotic spacecraft are controlled by sets of commands called 'sequences.' These sequences must be checked against mission constraints. Making our existing constraint checking program faster would enable new capabilities in our uplink process. Therefore, we are rewriting this program to run on a parallel computer. To do so, we had to determine how to run constraint-checking algorithms in parallel and create a new method of specifying spacecraft models and constraints. This new specification gives us a means of representing flight systems and their predicted response to commands which could be used in a variety of applications throughout the command process, particularly during anomaly or high-activity operations. This commonality could reduce operations cost and risk for future complex missions. Lessons learned in applying some parts of this system to the TOPEX/Poseidon mission will be described. AGENDA: A TASK ORGANIZER AND SCHEDULER
Isabelle Fratter *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission

Operations 1 Mar. 1993 p 279-284 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

AGENDA will be the main tool used in running the SPOT 4 Earth Observation Satellite's Operational Control Center. It will reduce the operator's work load and make the task easier. AGENDA sets up the work plan for a day of operations, automatically puts the day's tasks into sequence and monitors their progress in real time. Monitoring is centralized, and the tasks are run on different computers in the Center. Once informed of any problems, the operator can intervene at any time while an activity is taking place. To carry out the various functions, the operator has an advanced, efficient, ergonomic graphic interface based on X11 and OSF/MOTIF. Since AGENDA is the heart of the Center, it has to satisfy several constraints that have been taken into account during the various development phases. AGENDA is currently in its final development stages. Author (revised)

COLUMBUS SYSTEM SUPPORT FOR TELESCIENCE OPERATIONS
David W. Lytton and Rolf Schulze (European Space Agency. European Space Research and Technology Center, ESTEC, Noordwijk, Netherlands.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 285-290 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

With the given constraints of the space environment, the telescience concept aims at providing a space mission user with optimum flexibility and responsiveness for spaceborne investigations. The concept includes automated system management functions, which allocate and monitor planned resources and time windows, within which the investigator can perform his science interactively responding 'on-line' to experimental data. During the telescience operation, the user is given the capability to send telecommands to the payload from the User Home Base with transparency to the rest of the system. Any violation of the 'booked' time and resources will be detected by the system and reported back to the user for appropriate action. Ultimately, the system will react to maintain the integrity of the system and its payload. Upon completion of the telescience session, the system management function reverses the system configuration and deallocates resources automatically. Author (revised)

GENERIC MISSION PLANNING CONCEPTS FOR SPACE ASTRONOMY MISSIONS
O. T. Guffin and J. F. Onken *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 291-296 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The past two decades have seen the rapid development of space astronomy, both manned and unmanned, and the concurrent proliferation of the operational concepts and software that have been produced to support each individual project. Having been involved in four of these missions since the '70's and three yet to fly in the present decade, the authors believe it is time to step back and evaluate this body of experience from a macro-systems point of view to determine the potential for generic mission planning concepts that could be applied to future missions. This paper presents an organized evaluation of astronomy mission planning functions, functional flows, iteration cycles, replanning activities, and the requirements that drive individual concepts to specific solutions. The conclusions drawn from this exercise are then used to propose a generic concept that could support multiple missions. Author (revised)

A MOS FOR ALL SEASONS
Larry Bryant *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 301-306 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

From a systems perspective, this paper examines the challenges of a single system to support multiple JPL space exploration missions and the need for unitary responsibility for the system. The focus is a Mission Operations System (MOS), which is effectively a mission management organization with direct authority over data system operations, command sequencing, flight operations control, data management, trajectory determination, telemetry and data acquisition, and spacecraft analysis. Stratagems for training and the approach to processes, procedures, and interfaces to facilitate the transition from the present situation to a truly multimission operational environment are developed. The outcome is a paradigm for a MOS that is achievable, that can effectively support multiple projects, and that can take advantage of technological changes without perturbing the entire system. AN OPERATIONS CONCEPT METHODOLOGY TO ACHIEVE LOW-COST MISSION OPERATIONS
Kenneth W. Ledbetter and Stephen D. Wall (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 307-312 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Historically, the Mission Operations System (MOS) for a space mission has been designed last because it is needed last. This has usually meant that the ground system must adjust to the flight vehicle design, sometimes at a significant cost. As newer missions have increasingly longer flight operations lifetimes, the MOS becomes proportionally more difficult and more resource-consuming. We can no longer afford to design the MOS last. The MOS concept may well drive the spacecraft, instrument, and mission designs, as well as the ground system. A method to help avoid these difficulties, responding to the changing nature of mission operations is presented. Proper development and use of an Operations Concept document results in a combined flight and ground system design yielding enhanced operability and producing increased flexibility for less cost. MISSION ENGINEERING
Paul Ondrus and Michael Fatig (Bendix Field Engineering Corp., Seabrook, MD.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 313-318 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Goddard Space Flight Center's projects are facing new challenges with respect to the cost effective development and operation of spaceflight missions. Challenges, such as cost limits, compression of schedules, rapidly changing technology, and increasing mission complexity are making the mission development process more dynamic. A concept of 'Mission Engineering' as a means of addressing these challenges is proposed. It is an end-to-end, multimission development methodology that seeks to integrate the development processes between the space, ground, science, and operations segments of a mission. It thereby promotes more mission-oriented system solutions, within and across missions. Author (revised)

MANNED SPACE-LABORATORIES CONTROL CENTER (MSCC) OPERATIONS CONCEPT
Joachim Kehr *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 319-325 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The initiation of the (German-) nationally funded control center for manned spaceflight operations triggered by the invitation of President Reagan to ESA, Japan, and Canada in 1984 to join the International Space Station Freedom Program is recalled. The requirements for a Manned Space-Laboratories Control Center (MSCC) as defined at the beginning of the planning and construction process in 1987 and the resulting modifications during the various programmatic scenario changes on NASA and ESA side between 1987 and now are presented. The validity of the original requirements with respect to the current scenario, which asks for a logical evolution from the execution of the D-2 mission in January 1993 via the European Columbus Precursor flights (in particular the E-1 mission) towards Columbus Attached Laboratory (APM)-operations by the end of this century are discussed. The resulting tasks of the MSCC for the various missions, the current configuration, and the ensuing operations concept leading from a more centralized concept for D-2 towards a decentralized payload operations concept for the APM and the implications with respect to European and International interfaces are presented. The planned Columbus MSCC facility architecture and its expected modifications introduced by the ESA Ministerial Conference in Munich (Nov. 1991) and follow-on discussions are briefly addressed. The last chapter outlines the planned services to be provided by the MSCC to the decentralized User (experimenter) community. Issues like decentralized mission planning on executional level, command validation, data flow coordination, archiving services, and telescience capabilities are highlighted from a MSCC point of view. The Advanced Multimission Operations System (AMMOS) at NASA's Jet Propulsion Laboratory is based on a highly adaptable multimission ground data system (MGDS) for mission operations. The goal for MGDS is to support current flight project science and engineering personnel and to meet the demands of future missions while reducing associated operations and software development costs. MGDS has become a powerful and flexible mission operations system by using a network of heterogeneous workstations, emerging open system standards, and selecting an adaptable tools-based architecture. Challenges in developing adaptable systems for mission operations and the benefits of this approach are described. Author (revised)

AN APPROACH TO THE DESIGN OF OPERATIONS SYSTEMS
Roy L. Chafin and Patrick S. Curran *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 333-341 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The MultiMission Control Team (MMCT) consists of mission controllers which provides Real-Time operations support for the Mars Observer project. The Real-Time Operations task is to insure the integrity of the ground data system, to insure that the configuration is correct to support the mission, and to monitor the spacecraft for the Spacecraft Team. Operations systems are typically developed by adapting operations systems from previous projects. Problems tend to be solved empirically when they are either anticipated or observed in testing. This development method has worked in the past when time was available for extensive Ops testing. In the present NASA budget environment, a more cost conscious design approach has become necessary. Cost is a concern because operations is an ongoing, continuous activity. Reducing costs entails reducing staff. Reducing staffing levels potentially increases the risk of mission failure. Therefore, keeping track of the risk level is necessary. Author

OBJECT-ORIENTED TECHNOLOGIES IN A MULTI-MISSION DATA SYSTEM
Susan C. Murphy, Kevin J. Miller, and John J. Louie *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 343-348 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The Operations Engineering Laboratory (OEL) at JPL is developing new technologies that can provide more efficient and productive ways of doing business in flight operations. Over the past three years, we have worked closely with the Multi-Mission Control Team to develop automation tools, providing technology transfer into operations and resulting in substantial cost savings and error reduction. The OEL development philosophy is characterized by object-oriented design, extensive reusability of code, and an iterative development model with active participation of the end users. Through our work, the benefits of object-oriented design became apparent for use in mission control data systems. Object-oriented technologies and how they can be used in a mission control center to improve efficiency and productivity are explained. The current research and development efforts in the JPL Operations Engineering Laboratory are also discussed to architect and prototype a new paradigm for mission control operations based on object-oriented concepts. MANAGEMENT OF INFORMATION FOR MISSION OPERATIONS USING AUTOMATED KEYWORD REFERENCING c82
Roger A. Davidson and Patrick S. Curran *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 349-354 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Although millions of dollars have helped to improve the operability and technology of ground data systems for mission operations, almost all mission documentation remains bound in printed volumes. This form of documentation is difficult and timeconsuming to use, may be out-of-date, and is usually not cross-referenced with other related volumes of mission documentation. A more effective, automated method of mission information access is needed. A new method of information management for mission operations using automated keyword referencing is proposed. We expound on the justification for and the objectives of this concept. The results of a prototype tool for mission information access that uses a hypertextlike user interface and existing mission documentation are shared. Finally, the future directions and benefits of our proposed work are described. Author (revised)

AMFESYS: MODELLING AND DIAGNOSIS FUNCTIONS FOR OPERATIONS SUPPORT
J. Wheadon *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 355-360 Sponsored in part by Siemens A.G. (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Packetized telemetry, combined with low station coverage for close-earth satellites, may introduce new problems in presenting to the operator a clear picture of what the spacecraft is doing. A recent ESOC study has gone some way to show, by means of a practical demonstration, how the use of subsystem models combined with artificial intelligence techniques, within a real-time spacecraft control system (SCS), can help to overcome these problems. A spin-off from using these techniques can be an improvement in the reliability of the telemetry (TM) limit-checking function, as well as the telecommand verification function, of the Spacecraft Control systems (SCS). The problem and how it was addressed, including an overview of the 'AMF Expert System' prototype are described, and proposes further work which needs to be done to prove the concept. The Automatic Mirror Furnace is part of the payload of the European Retrievable Carrier (EURECA) spacecraft, which was launched in July 1992. Author (revised)

MARS OBSERVER SCREEN DISPLAY DESIGN FOR A MULTIMISSION ENVIRONMENT c14
Roy L. Chafin *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 363-370 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The Multi Mission Control Team (MMCT) is responsible for support to real time operations of the Mars Observer Mission. The team has the responsibility for monitoring the ground data system for the integrity of the telemetry and command data links. It also supports the Mars Observers Spacecraft Team in monitoring spacecraft events. The Data Monitor and Display subsystem (DMD) workstation provides the data interface with the ground data system. DMD workstation displays were developed to support the Mission Controllers in accomplishing their assigned tasks for supporting

the Mars Observer mission. The display design concepts that were used in the Mar Observer MMCT displays to minimize the cognitive demands on the controllers and enhance the MMCT operations were presented. The Data Monitor and Display subsystem (DMD) is the controllers window into the spacecraft and the ground data system. The DMD is a workstation that provides a variety of formatted data displays to the controller. The displays present both spacecraft telemetry data and ground system monitor data. Some displays are preplanned and developed prior to the operations in which they are used. These are called fixed displays and are quite versatile in format and content. Other displays and plots can be created in real time. These displays have limited formats but flexibility in content. These are called list or message displays. They can be rapidly generated by the controller as needed. The MMCT display repertoire provides a mix of displays appropriate to the needs of the MMCT controllers.

THE FOT TOOL KIT CONCEPT

Michael Fatig *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 371-374 (For primary document see N94-23832 06-66)
Avail: CASI HC A01/MF A10

Flight operations and the preparation for it has become increasingly complex as mission complexities increase. Further, the mission model dictates that a significant increase in flight operations activities is upon us. Finally, there is a need for process improvement and economy in the operations arena. It is therefore time that we recognize flight operations as a complex process requiring a defined, structured, and life cycle approach vitally linked to space segment, ground segment, and science operations processes. With this recognition, an FOT Tool Kit consisting of six major components designed to provide tools to guide flight operations activities throughout the mission life cycle was developed. The major components of the FOT Tool Kit and the concepts behind the flight operations life cycle process as developed at NASA's GSFC for GSFC-based missions are addressed. The Tool Kit is therefore intended to increase productivity, quality, cost, and schedule performance of the flight operations tasks through the use of documented, structured methodologies; knowledge of past lessons learned and upcoming new technology; and through reuse and sharing of key products and special application programs made possible through the development of standardized key products and special program directories.

VMPLOT: A VERSATILE ANALYSIS TOOL FOR MISSION OPERATIONS

Allen W. Bucher *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 381-386 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

VMPLOT is a versatile analysis tool designed by the Magellan Spacecraft Team to graphically display engineering data used to support mission operations. While there is nothing revolutionary or innovative about graphical data analysis tools, VMPLOT has some distinguishing features that set it apart from other custom or commercially available software packages. These features include the ability to utilize time in a Universal Time Coordinated (UTC) or Spacecraft Clock (SCLK) format as an enumerated data type, the ability to automatically scale both axes based on the data to be displayed (including time), the ability to combine data from different files, and the ability to utilize the program either interactively or in batch mode, thereby enhancing automation. Another important feature of VMPLOT not visible to the user is the software engineering philosophies utilized. A layered approach was used to isolate program functionality to different layers. This was done to increase program portability to different platforms and to ease maintenance and enhancements due to changing requirements. The functionality of the unique features of VMPLOT as well as highlighting the algorithms that make these features possible are described. The software engineering philosophies used in the creation of the software tool are also summarized. Author (revised)

REAL-TIME AUTOMATED FAILURE IDENTIFICATION IN THE CONTROL CENTER COMPLEX (CCC) c31

Sarah Kirby, Janet Lauritsen, Ginger Pack, Anhhoang Ha (McDonnell-Douglas Space Systems Co., Houston, TX.), Steven Jowers (McDonnell-Douglas Space Systems Co., Houston, TX.), Robert McNenny (McDonnell-Douglas Space Systems Co., Houston, TX.), The Truong (McDonnell-Douglas Space Systems Co., Houston, TX.), and James Dell (Loral Space Information Systems, Houston, TX.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 387-392 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

A system which will provide real-time failure management support to the Space Station Freedom program is described. The system's use of a simplified form of model based reasoning qualifies it as an advanced automation system. However, it differs from most such systems in that it was designed from the outset to meet two sets of requirements. First, it must provide a useful increment to the fault management capabilities of the Johnson Space Center (JSC) Control Center Complex (CCC) Fault Detection Management system. Second, it must satisfy CCC operational environment constraints such as cost, computer resource requirements, verification, and validation, etc. The need to meet both requirement sets presents a much greater design challenge than would have been the case had functionality been the sole design consideration. The choice of technology, discussing aspects of that choice and the process for migrating it into the control center is overviewed. Author (revised)

INFLUENCE OF A NEW GENERATION OF OPERATIONS SUPPORT SYSTEMS ON CURRENT SPACECRAFT OPERATIONS PHILOSOPHY: THE USERS FEEDBACK

Jean Michel Darroy *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission

Operations 1 Mar. 1993 p 403-409 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Current trends in the spacecraft mission operations area (spacecraft & mission complexity, project duration, required flexibility are requiring a breakthrough for what concerns philosophy, organization, and support tools. A major evolution is related to space operations 'informationalization', i.e adding to existing operations support & data processing systems a new generation of tools based on advanced information technologies (object-oriented programming, artificial intelligence, data bases, hypertext) that automate, at least partially, operations tasks that used be performed manually (mission & project planning/scheduling, operations procedures elaboration & execution, data analysis & failure diagnosis). All the major facets of this 'informationalization' are addressed at MATRA MARCONI SPACE, operational applications were fielded and generic products are becoming available. These various applications have generated a significant feedback from the users (at ESA, CNES, ARIANESPACE, MATRA MARCONI SPACE), which is now allowing us to precisely measure how the deployment of this new generation of tools, that we called OPSWARE, can 'reengineer' current spacecraft mission operations philosophy, how it can make space operations faster, better, and cheaper. This paper can be considered as an update of the keynote address 'Knowledge-Based Systems for Spacecraft Control' presented during the first 'Ground Data Systems for Spacecraft Control' conference in Darmstadt, June 1990, with a special emphasis on these last two years users feedback. ESSOPE: TOWARDS S/C OPERATIONS WITH REACTIVE SCHEDULE PLANNING
J. Wheadon *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 417-422 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The ESSOPE is a prototype front-end tool running on a Sun workstation and interfacing to ESOC's MSSS spacecraft control system for the exchange of telecommand requests (to MSSS) and telemetry reports (from MSSS). ESSOPE combines an operations Planner-Scheduler, with a Schedule Execution Control function. Using an internal 'model' of the spacecraft, the Planner generates a schedule based on utilization requests for a variety of payload services by a community of Olympus users, and incorporating certain housekeeping operations. Conflicts based on operational constraints are automatically resolved, by employing one of several available strategies. The schedule is passed to the execution function which drives MSSS to perform it. When the schedule can no longer be met, either because the operator interferes (by delays or changes of requirements), or because ESSOPE has recognized some spacecraft anomalies, the Planner produces a modified schedule maintaining the on-going procedures as far as consistent with the new constraints or requirements. THE ADVANCED TECHNOLOGY OPERATIONS SYSTEM: ATOS
J.-F. Kaufeler, H. A. Laue, K. Poulter (Logica Ltd., London, England.), and H. Smith (Logica Space and Communications Ltd., London, England.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 425-434 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Mission control systems supporting new space missions face ever-increasing requirements in terms of functionality, performance, reliability and efficiency. Modern data processing technology is providing the means to meet these requirements in new systems under development. During the past few years the European Space Operations Centre (ESOC) of the European Space Agency (ESA) has carried out a number of projects to demonstrate the feasibility of using advanced software technology, in particular, knowledge based systems, to support mission operations. A number of advances must be achieved before these techniques can be moved towards operational use in future missions, namely, integration of the applications into a single system framework and generalization of the applications so that they are mission independent. In order to achieve this goal, ESA initiated the Advanced Technology Operations System (ATOS) program, which will develop the infrastructure to support advanced software technology in mission operations, and provide applications modules to initially support: Mission Preparation, Mission Planning, Computer Assisted Operations, and Advanced Training. The first phase of the ATOS program is tasked with the goal of designing and prototyping the necessary system infrastructure to support the rest of the program. The major components of the ATOS architecture is presented. This architecture relies on the concept of a Mission Information Base (MIB) as the repository for all information and knowledge which will be used by the advanced application modules in future mission control systems. The MIB is being designed to exploit the latest in database and knowledge representation technology in an open and distributed system. In conclusion the technological and implementation challenges expected to be encountered, as well as the future plans and time scale of the project, are presented. Author (revised)

NASDA KNOWLEDGE-BASED NETWORK PLANNING SYSTEM
K. Yamaya, M. Fujiwara, S. Kosugi, M. Yambe (Fujitsu Ltd., Tokyo, Japan.), and M. Ohmori (Fujitsu Social Systems Engineering Ltd., Tokyo, Japan.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 435-440 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

One of the SODS (space operation and data system) sub-systems, NP (network planning) was the first expert system used by NASDA (national space development agency of Japan) for tracking and control of satellite. The major responsibilities of the NP system are: first, the allocation of network and satellite control resources and, second, the generation of the network operation plan data (NOP) used in automated control of the stations and control center facilities. Up to now, the first task of network resource scheduling was done by network operators. NP system automatically generates schedules using its knowledge base, which contains information on satellite orbits, station availability, which computer is dedicated to which satellite, and how many stations must be available for a particular satellite pass or a certain time period. The NP system is introduced. Author (revised)

A CROSS-DISCIPLINARY RESPONSE TO IMPROVE TEST ACTIVITIES: THE CORPORATE MEMORY CAPITALIZATION IN ARIANE4 TEST DOMAIN **c82**
Dinh Phuoc Vo, Christian Soler, N. Aussenac (Centre National de la Recherche Scientifique, Toulouse, France.), and D. Macchion (Centre National de la Recherche Scientifique, Toulouse, France.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993

p 441-450 (For primary document see N94-23832 06-66)
Avail: CASI HC A03/MF A10

The Assembly, Integration, Test, and Validation (AIT/AIV) of the Ariane4 Vehicle Equipment Bay was held at Matra Marconi Space (MMS) site of Toulouse for several years. For this activity, incident interpretation necessitates a great deal of different knowledge. When complex faults occur, particularly those appearing during overall control tests, experts of various domains (EGSE, software, on-board equipment) have to join for investigation sessions. Thus, an assistance tool for the identification of faulty equipment will improve the efficiency of diagnosis and the overall productivity of test activities. As a solution, the Aramiihs laboratory proposed considering the opportunity of a knowledge based system intended to assist the tester in diagnosis. This knowledge based system is, in fact, a short-term achievement of a long-term goal which is the capitalization of corporate memory in the Ariane4 test domain. Aramiihs is a research unit where engineers from MMS and researchers from the IRIT-CNRS cooperate on problems concerning new types of man-system interaction.

COMBINING REAL-TIME MONITORING AND KNOWLEDGE-BASED ANALYSIS IN MARVEL c63

Ursula M. Schwuttke, A. G. Quan, R. Angelino, and J. R. Veregge *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 453-458 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Real-time artificial intelligence is gaining increasing attention for applications in which conventional software methods are unable to meet technology needs. One such application area is the monitoring and analysis of complex systems. MARVEL, a distributed monitoring and analysis tool with multiple expert systems, was developed and successfully applied to the automation of interplanetary spacecraft operations at NASA's Jet Propulsion Laboratory. MARVEL implementation and verification approaches, the MARVEL architecture, and the specific benefits that were realized by using MARVEL in operations are described. Author (revised)

THE APPLICATION OF AUTOMATED OPERATIONS AT THE INSTITUTIONAL PROCESSING CENTER

Thomas H. Barr *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 459-464 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The JPL Institutional and Mission Computing Division, Communications, Computing and Network Services Section, with its mission contractor, OAO Corporation, have for some time been applying automation to the operation of JPL's Information Processing Center (IPC). Automation does not come in one easy to use package. Automation for a data processing center is made up of many different software and hardware products supported by trained personnel. The IPC automation effort formally began with console automation, and has since spiraled out to include production scheduling, data entry, report distribution, online reporting, failure reporting and resolution, documentation, library storage, and operator and user education, while requiring the interaction of multi-vendor and locally developed software. To begin the process, automation goals are determined. Then a team including operations personnel is formed to research and evaluate available options. By acquiring knowledge of current products and those in development, taking an active role in industry organizations, and learning of other data center's experiences, a forecast can be developed as to what direction technology is moving. With IPC management's approval, an implementation plan is developed and resources identified to test or implement new systems. As an example, IPC's new automated data entry system was researched by Data Entry, Production Control, and Advance Planning personnel. A proposal was then submitted to management for review. A determination to implement the new system was made and elements/personnel involved with the initial planning performed the implementation. The final steps of the implementation were educating data entry personnel in the areas effected and procedural changes necessary to the successful operation of the new system. Author (revised)

MAKING TOMORROW'S MISTAKES TODAY: EVOLUTIONARY PROTOTYPING FOR RISK REDUCTION AND SHORTER DEVELOPMENT TIME c14

Gary Friedman, Ursula M. Schwuttke, Scott Burliegh, Sanguan Chow, Randy Parlier, Lorrine Lee, Henry Castro, and Jim Gersbach *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 465-470 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

In the early days of JPL's solar system exploration, each spacecraft mission required its own dedicated data system with all software applications written in the mainframe's native assembly language. Although these early telemetry processing systems were a triumph of engineering in their day, since that time the computer industry has advanced to the point where it is now advantageous to replace these systems with more modern technology. The Space Flight Operations Center (SFOC) Prototype group was established in 1985 as a workstation and software laboratory. The charter of the lab was to determine if it was possible to construct a multimission telemetry processing system using commercial, off-the-shelf computers that communicated via networks. The staff of the lab mirrored that of a typical skunk works operation -- a small, multi-disciplinary team with a great deal of autonomy that could get complex tasks done quickly. In an effort to determine which approaches would be useful, the prototype group experimented with all types of operating systems, inter-process communication mechanisms, network protocols, packet size parameters. Out of that pioneering work came the confidence that a multi-mission telemetry processing system could be built using high-level languages running in a heterogeneous, networked workstation environment. Experience revealed that the operating systems on all nodes should be similar (i.e., all VMS or all PC-DOS or all UNIX), and that a unique Data Transport Subsystem tool needed to be built to address the incompatibilities of network standards, byte ordering, and socket buffering. The advantages of building a telemetry processing system based on emerging industry standards were numerous: by employing these standards, we would no longer be locked into a single vendor. When new technology came to market which offered ten times the performance at one eighth the cost, it would be possible to attach the new machine to the network, re-compile the application code, and run. In addition, we would no longer be plagued with lack of manufacturer support when we encountered obscure bugs. And maybe, hopefully, the eternal elusive goal of software portability across different vendors' platforms would finally be available. Some highlights of our prototyping efforts are described. NASDA'S ADVANCED ON-LINE SYSTEM (ADOLIS)

Yoshikatsu Yamamoto, Hideo Hara, Shigeo Yamada, Nobuyuki Hirata (Nippon Electric Co. Ltd., Yokohama, Japan.), Shigenori Komatsu (Nippon Electric Co. Ltd., Yokohama, Japan.), Seiji Nishihata (Nippon Electric Co. Ltd., Yokohama, Japan.), and Akio Oniyama (Nippon Electric Co. Ltd., Yokohama, Japan.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 471-476 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Spacecraft operations including ground system operations are generally realized by various large or small scale group work which is done by operators, engineers, managers, users and so on, and their positions are geographically distributed in many cases. In face-to-face work environments, it is easy for them to understand each other. However, in distributed work environments which need communication media, if only using audio, they become estranged from each other and lose interest in and continuity of work. It is an obstacle to smooth operation of spacecraft. NASDA has developed an experimental model of a new real-time operation control system called 'ADOLIS' (ADvanced On-Line System) adopted to such a distributed environment using a multi-media system dealing with character, figure, image, handwriting, video and audio information which is accommodated to operation systems of a wide range including spacecraft and ground systems. This papor describes the results of the development of the experimental model. Author (revised)

CONSTRAINT-BASED SCHEDULING **c81**
Monte Zweben *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 477-484 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The GERRY scheduling system developed by NASA Ames with assistance from the Lockheed Space Operations Company, and the Lockheed Artificial Intelligence Center, uses a method called constraint-based iterative repair. Using this technique, one encodes both hard rules and preference criteria into data structures called constraints. GERRY repeatedly attempts to improve schedules by seeking repairs for violated constraints. The system provides a general scheduling framework which is being tested on two NASA applications. The larger of the two is the Space Shuttle Ground Processing problem which entails the scheduling of all the inspection, repair, and maintenance tasks required to prepare the orbiter for flight. The other application involves power allocation for the NASA Ames wind tunnels. Here the system will be used to schedule wind tunnel tests with the goal of minimizing power costs. In this paper, we describe the GERRY system and its application to the Space Shuttle problem. We also speculate as to how the system would be used for manufacturing, transportation, and military problems. Author

CUSTOMIZING GRAPHICAL USER INTERFACE TECHNOLOGY FOR SPACECRAFT CONTROL CENTERS
Edward Beach (Computer Sciences Corp., Laurel, MD.), Peter Giancola (Computer Sciences Corp., Laurel, MD.), Steven Gibson (Integral Systems, Inc., Lanham, MD.), and Ronald Mahmot *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 485-490 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The Transportable Payload Operations Control Center (TPOCC) project is applying the latest in graphical user interface technology to the spacecraft control center environment. This project of the Mission Operations Division's (MOD) Control Center Systems Branch (CCSB) at NASA Goddard Space Flight Center (GSFC) has developed an architecture for control centers which makes use of a distributed processing approach and the latest in Unix workstation technology. The TPOCC project is committed to following industry standards and using commercial off-the-shelf (COTS) hardware and software components wherever possible to reduce development costs and to improve operational support. TPOCC's most successful use of commercial software products and standards has been in the development of its graphical user interface. This paper describes TPOCC's successful use and customization of four separate layers of commercial software products to create a flexible and powerful user interface that is uniquely suited to spacecraft monitoring and control. APPLICATIONS OF CCSDS RECOMMENDATIONS TO INTEGRATED GROUND DATA SYSTEMS (IGDS)
Hiroshi Mizuta, Daniel Martin (Hitachi Ltd., Yokohama, Japan.), Hatsuhiko Kato (Hitachi Ltd., Yokohama, Japan.), and Hirokazu Ihara (Hitachi Ltd., Yokohama, Japan.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 495-500 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

This paper describes an application of the CCSDS Principle Network (CPH) service model to communications network elements of a postulated Integrated Ground Data System (IGDS). Functions are drawn principally from COSMICS (Cosmic Information and Control System), an integrated space control infrastructure, and the Earth Observing System Data and Information System (EOSDIS) Core System (ECS). From functional requirements, this paper derives a set of five communications network partitions which, taken together, support proposed space control infrastructures and data distribution systems. Our functional analysis indicates that the five network partitions derived in this paper should effectively interconnect the users, centers, processors, and other architectural elements of an IGDS. This paper illustrates a useful application of the CCSDS (Consultive Committee for Space Data Systems) Recommendations to ground data system development. Author (revised)

THE ADVANCED ORBITING SYSTEMS TESTBED PROGRAM: RESULTS TO DATE **c14**
Penny A. Newsome and John F. Otranto *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 501-506 Sponsored by NASA, Washington (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The Consultative Committee for Space Data Systems Recommendations for Packet Telemetry and Advanced Orbiting Systems (AOS) propose standard solutions to data handling problems common to many types of space missions. The Recommendations address only space/ground and space/space data handling systems. Goddard Space Flight Center's AOS Testbed (AOST) Program was initiated to better understand the Recommendations and their impact on real-world systems, and to examine the extended domain of ground/ground data handling systems. Central to the AOST Program are the development of an end-to-end Testbed and its use in a comprehensive testing program. Other Program activities include flight-qualifiable component development, supporting studies, and knowledge dissemination. The results and products of the Program will reduce the uncertainties associated with the development of operational space and ground systems that implement the Recommendations. The results presented in this paper include architectural issues, a draft proposed standardized test suite and flight-qualifiable components. Author

RELIABLE TRANSFER OF DATA FROM GROUND TO SPACE **c32**
Fred Brosi *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 507-512 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

This paper describes the problems involved in uplink of data from control centers on the ground to spacecraft, and explores the solutions to those problems, past. present. and future. The evolution of this process, from simple commanding to transfer of large volumes of data and commands is traced. The need for reliable end-to-end protocols for commanding and file transfer is demonstrated, and the shortcomings of both existing telecommand protocols and commercial products to meet this need are discussed. Recent developments in commercial protocols that may be adaptable to the mentioned operations environment are surveyed, and current efforts to develop a suite of protocols for reliable transfer in this environment are presented. THE EURECA TELECOMMANDING CHAIN: EXPERIENCE WITH PACKET TELECOMMAND AND TELEMETRY SYSTEMS **c32**
C. Mueller, R. Bater, and E. M. Sorensen (European Space Agency. European Space Operations Center, Darmstadt, Germany.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 513-518 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The European Retrieval Carrier (EURECA) was launched on its first flight on the 31st July 1992 by the Space Shuttle Atlantis. EURECA is characterized by several new on-board features, most notable Packet Telemetry and a partial implementation of Packet Telecommanding using an early version of the Command Operation Procedure (COP-1) protocol. EURECA has also very low contact time with its Ground Station, with a consequent high number of out-of-visibility onboard operations. This paper concentrates on the implementation and operational experience with the COP-1 Protocol and the effect the short ground contact time has on the design of the Commanding System. Another interesting feature is that the COP-1 is implemented at the control center rather than at the ground

station. The COP-1 protocol also successfully supported the mission during the launch where commands were sent via NASCOM and the Shuttle.

VERIFICATION OF TECHNICAL ELEMENTS OF THE ADVANCED SPACECRAFT BASED UPON THE CCSDS RECOMMENDATION c18
Hideo Hara, Sigeo Yamada, Yoshikatsu Yamamoto, Seiichi Fujii (Fujitsu Ltd., Tokyo, Japan.), Kaoru Tumura (Fujitsu Ltd., Tokyo, Japan.), Masato Yokomizo (Fujitsu Ltd., Tokyo, Japan.), and Hiroyuki Ogasawara (Fujitsu Ltd., Tokyo, Japan.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 519-524 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

We are going to meet the era when advanced spacecraft such as space stations are developed and operated. The current system of the satellite operations control will need to undergo many changes. We consider that the future system will require the following functions: the function for interchanging data between international agencies, processing the various kinds of space data, and distributing data as many unspecified users require. However, we have to solve the following problems in order to satisfy these requirements: the problem of standardization of space data communication protocol, establishment of multimedia data management method, and standardization of the user interface. This paper describes three techniques to solve the above mentioned problems. That is, standardization of the data communication protocol between space and ground by AOS (Advanced Orbiting System) protocol of CCSDS (Consultative Committee for Space Data Systems) Recommendation, management of multimedia data by catalog reference, standardization of user interface by SFDU(Standard Formatted Data Unit) of CCSDS Recommendation.

DISTRIBUTED COMPUTING ENVIRONMENTS FOR FUTURE SPACE CONTROL SYSTEMS c61
Pierre Viallefont *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 525-529 (For primary document see N94-23832 06-66)
Avail: CASI HC A01/MF A10

The aim of this paper is to present the results of a CNES research project on distributed computing systems. The purpose of this research was to study the impact of the use of new computer technologies in the design and development of future space applications. The first part of this study was a state-of-the-art review of distributed computing systems. One of the interesting ideas arising from this review is the concept of a 'virtual computer' allowing the distributed hardware architecture to be hidden from a software application. The 'virtual computer' can improve system performance by adapting the best architecture (addition of computers) to the software application without having to modify its source code. This concept can also decrease the cost and obsolescence of the hardware architecture. In order to verify the feasibility of the 'virtual computer' concept, a prototype representative of a distributed space application is being developed independently of the hardware architecture. DIGITAL TEST SIGNAL GENERATION: AN ACCURATE SNR CALIBRATION APPROACH FOR THE DSN c32
Benito O. Gutierrez-Luaces *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 531-536 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

In support of the on-going automation of the Deep Space Network (DSN) a new method of generating analog test signals with accurate signal-to-noise ratio (SNR) is described. High accuracy is obtained by simultaneous generation of digital noise and signal spectra at the desired bandwidth (base-band or bandpass). The digital synthesis provides a test signal embedded in noise with the statistical properties of a stationary random process. Accuracy is dependent on test integration time and limited only by the system quantization noise (0.02 dB). The monitor and control as well as signal-processing programs reside in a personal computer (PC). Commands are transmitted to properly configure the specially designed high-speed digital hardware. The prototype can generate either two data channels modulated or not on a subcarrier, or one QPSK channel, or a residual carrier with one biphase data channel. The analog spectrum generated is on the DC to 10 MHz frequency range. These spectra may be up-converted to any desired frequency without loss on the characteristics of the SNR provided. Test results are presented. Author

AUTOMATIC TOOLS FOR SYSTEM TESTING c14
N. M. Peccia *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 537-540 (For primary document see N94-23832 06-66)
Avail: CASI HC A01/MF A10

As spacecraft control and other space-related ground systems become increasingly complex, the effort required in testing and validation also increases. Implementation of a spacecraft control system normally involves a number of incremental deliveries. In addition kernel or general purpose software may also be involved, which must itself be considered in the integration and testing program. Tools can be used to assist this testing. These can reduce the effort required or alternatively they can ensure that for a given level of effort, a better job is done. Great benefit could be derived by automating certain types of testing (interactive software) which up to now has been performed manually at a terminal. This paper reports on an on-going study. The study examines means of automating spacecraft control system testing, evaluates relevant commercial tools and aims to prototype basic automatic testing functions. Author

REPRESENTING OPERATIONS PROCEDURES USING TEMPORAL DEPENDENCY NETWORKS c32
Kristina E. Fayyad and Lynne P. Cooper *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 541-546 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

DSN Link Monitor & Control (LMC) operations consist primarily of executing procedures to configure, calibrate, test, and operate a communications link between an interplanetary spacecraft and its mission control center. Currently the LMC operators are responsible for integrating procedures into an end-to-end series of steps. The research presented in this paper is investigating new ways of specifying operations procedures that incorporate the insight of operations, engineering, and science personnel to improve mission operations. The paper describes the rationale for using Temporal Dependency Networks (TDN's) to represent the procedures, a description of how the data is acquired, and the knowledge engineering effort required to represent operations procedures. Results of operational tests of this concept, as implemented in the LMC Operator Assistant Prototype (LMCOA), are also presented. Author

SITUATION MANAGEMENT IN THE LINK MONITOR AND CONTROL OPERATOR ASSISTANT (LMCOA) c32
Randall W. Hill, Jr. and Lorrine F. Lee *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 547-552 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

This paper describes a knowledge-based system called the Situation Manager that was developed for the Link Monitor and Control Operator Assistant (LMCOA) at the Jet Propulsion Laboratory. This system was developed in response to a number of deficiencies that were identified in an earlier version of the LMCOA: the need to close the control loop between sending a directive and knowing when its execution is complete (versus just closing the communications loop), the need to recognize an anomaly and alert the operator when a directive is rejected or a link device fails, and the need to suggest ways to work around an anomaly, provided that it is recognizable. In response to these needs, the Situation

Manager has been designed to provide the LMCOA with three basic capabilities: situation assessment, anomaly diagnosis, and recovery from commonly occurring problems. Author

DEEP SPACE NETWORK (DSN), NETWORK OPERATIONS CONTROL CENTER (NOCC) COMPUTER-HUMAN INTERFACES **c60**
Alvin Ellman and Magdi Carlton *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 561-564 (For primary document see N94-23832 06-66)
Avail: CASI HC A01/MF A10

The Network Operations Control Center (NOCC) of the DSN is responsible for scheduling the resources of DSN, and monitoring all multi-mission spacecraft tracking activities in real-time. Operations performs this job with computer systems at JPL connected to over 100 computers at Goldstone, Australia and Spain. The old computer system became obsolete, and the first version of the new system was installed in 1991. Significant improvements for the computer-human interfaces became the dominant theme for the replacement project. Major issues required innovating problem solving. Among these issues were: How to present several thousand data elements on displays without overloading the operator? What is the best graphical representation of DSN end-to-end data flow? How to operate the system without memorizing mnemonics of hundreds of operator directives? Which computing environment will meet the competing performance requirements? This paper presents the technical challenges, engineering solutions, and results of the NOCC computer-human interface design. Author

A METHOD FOR INTERFERENCE MITIGATION IN SPACE COMMUNICATIONS SCHEDULING **c32**
Yen F. Wong and James L. Rash *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 565-571 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Increases in the number of user spacecraft and data rates supported by NASA's Tracking and Data Relay Satellite System (TDRSS) in the S and Ku bands could result in communications conflicts due to mutual interference. More attention must be paid to this problem in terms of communications scheduling. A method based on consideration of all relevant communications parameters has been developed to mitigate interference while minimizing unnecessary scheduling restrictions on both the TDRSS network and user resources. This method calculates required separation angles at TDRS and produces potential interference intervals, which can be used in the production of schedules free of unacceptable interference. The method also can be used as the basis for analysis, evaluation, and optimization of user schedules with respect to communications performance. This paper describes the method and its proposed application to scheduling in space communications. Test cases relative to missions operating at Ku-band, including Space Shuttle, are discussed. Avail: CASI HC A02/MF A10

TOPEX/Poseidon (T/P) is a joint mission between NASA and the Centre National d'Etudes Spatiales (CNES), the French Space Agency. The TOPEX/Poseidon Precision Orbit Determination Production System (PODPS) was developed at Goddard Space Flight Center (NASA/GSFC) to produce the absolute orbital reference required to support the fundamental ocean science goals of this satellite altimeter mission within NASA. The orbital trajectory for T/P is required to have a RMS accuracy of 13 centimeters in its radial component. This requirement is based on the effective use of the satellite altimetry for the isolation of absolute long-wavelength ocean topography important for monitoring global changes in the ocean circulation system. This orbit modeling requirement is at an unprecedented accuracy level for this type of satellite. In order to routinely produce and evaluate these orbits, GSFC has developed a production and supporting expert system. The PODPS is a menu driven system allowing routine importation and processing of tracking data for orbit determination, and an evaluation of the quality of the orbit so produced through a progressive series of tests. Phase 1 of the expert system grades the orbit and displays test results. Later phases undergoing implementation, will prescribe corrective actions when unsatisfactory results are seen. This paper describes the design and implementation of this orbit determination production system and the basis for its orbit accuracy assessment within the expert system. Author

A REAL-TIME NAVIGATION MONITORING EXPERT SYSTEM FOR THE SPACE SHUTTLE MISSION CONTROL CENTER **c17**
Lui Wang and Malise Fletcher *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 591-599 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The ONAV (Onboard Navigation) Expert System has been developed as a real time console assistant for use by ONAV flight controllers in the Mission Control Center at the Johnson Space Center. This expert knowledge based system is used to monitor the Space Shuttle onboard navigation system, detect faults, and advise flight operations personnel. This application is the first knowledge-based system to use both telemetry and trajectory data from the Mission Operations Computer (MOC). To arrive at this stage, from a prototype to real world application, the ONAV project has had to deal with not only AI issues but operating environment issues. The AI issues included the maturity of AI languages and the debugging tools, verification, and availability, stability and size of the expert pool. The environmental issues included real time data acquisition, hardware suitability, and how to achieve acceptance by users and management. Author

XRTD: AN X-WINDOWS BASED, REAL-TIME RADIOMETRIC DISPLAY AND ANALYSIS SYSTEM c32
Vincent M. Pollmeier *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 601-606 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

XRTD is a graphical user interface (GUI) based tool for monitoring real time radiometric spacecraft data. The tool is designed to allow the navigation analyst to both view and analyze the characteristics of Doppler and ranging data. This capability is critical if ground personnel wish to verify the correct performance of ongoing maneuvers. The raw tracking data is transferred from Deep Space Network (DSN) computers to a local workstation, where the predicted value for the observable is subtracted from the actual observed value to create a residual. The tool then allows the navigation analyst to rescale and replot the data using simple GUI techniques. The navigator may then perform a number of data analysis and modeling techniques on the resulting residuals to allow for the real time characterization of spacecraft events. These techniques include the modeling of maneuvers, the compression and differencing of data, and Fast Fourier transforms of the data. This tool has shortened the amount of time required for initial characterization of spacecraft maneuvers from several hours to a few minutes. Author (revised)

KALMAN FILTERING APPLIED TO REAL-TIME MONITORING OF APOGEE MANEUVERS c13
Frederic deBoer and Christian Barbier (Alcatel Espace, Toulouse, France.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 607-612 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Part of the Space Mathematics Division in CNES, the Flight Dynamics Center provides attitude and orbit determinations and maneuvers during the Launch and Early Operation Phase (LEOP) of geostationary satellites. Orbit determination is based on a Kalman filter method; when the 2 GHz CNES/NASA network is used, Doppler measurements are available and allow orbit determination during the apogee maneuvers. This method was used for TELE-X and TDF 2 LEOP (3-axis controlled satellites) and also for TELECOM 2 and HISPASAT (spun satellites): it enables us to follow the evolution of the maneuver and gives out a quite accurate estimation of the reached orbit. In this paper, we briefly describe the dynamic models of the orbit evolution in both cases, '3-axis' and 'inertial' thrust. Then, we present the results obtained for each case. Afterwards, we present some cases to show the robustness of the filter. Author

MARS 1994/1996: THE FRENCH NAVIGATION TASKS c12
Frederic Bonneau, Jacques Bernard, and Damien Delobette (Societe d'Economie et de Mathematique Appliquees, Toulouse, France.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 613-618 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

In the fall of 1994, Russia will launch a spacecraft to Mars. France is involved in many scientific experiments which are onboard the spacecraft, as PI or CI. Some days before the Mars orbit insertion maneuver, two small stations and two penetrators will be injected into an entry trajectory. They will carry out for at least six months in situ analysis on the Martian surface. Two years later, a second spacecraft will be launched. It will carry the French balloon and a small rover. The scientific data of these landers will be relayed to earth via the spacecraft. However, during the first 20 days of their mission, Mars Observer will be used. To this end, a Mars balloon relay will be used, which will receive the data from the landers and store them into the memory of the Mars Observer camera. The spacecraft will also be used to localize the landers with the help of relative one-way Doppler measurements. An international cooperative is set up for this process, including JPS, Russian ballistic centers (Babakine, Institute of Applied Mathematics, Moscow Flight Control Center), and CNES Toulouse. Another task dedicated to the space mathematics division of CNES is to support the French scientists to prepare their telecommands and to analyze their telemetry. This second part is integrated into the French ground segment created for the Mars 94/96 mission. This paper describes the method used in CNES for the localization process, the support provided to the scientists, and the links for the data exchange. Author (revised)

MERCATOR: METHODS AND REALIZATION FOR CONTROL OF THE ATTITUDE AND THE ORBIT OF SPACECRAFT c17
Gilles Tavernier and Genevieve Campan *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 619-628 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Since 1974, CNES has been involved in geostationary positioning. Among different entities participating in operations and their preparation, the Flight Dynamics Center (FDC) is in charge of performing the following tasks: orbit determination; attitude determination; computation, monitoring, and calibration of orbit maneuvers; computation, monitoring, and calibration of attitude maneuvers; and operational predictions. In order to fulfill this mission, the FDC receives telemetry from the satellite and localization measurements from ground stations (e.g., CNES, NASA, INTELSAT). These data are processed by space dynamics programs integrated in the MERCATOR system which is run on SUN workstations (UNIX O.S.). The main features of MERCATOR are redundancy, modularity, and flexibility: efficient, flexible, and user friendly man-machine interface; and four identical SUN stations redundantly linked in an Ethernet network. Each workstation can perform all the tasks from data acquisition to computation results dissemination through a video network. A team of four engineers can handle the space mechanics aspects of a complete geostationary positioning from the injection into a transfer orbit to the final maneuvers in the station-keeping window. MERCATOR has been or is to be used for operations related to more than ten geostationary positionings. Initially developed for geostationary satellites, MERCATOR's methodology was also used for satellite control centers and can be applied to a wide range of satellites and to future manned missions. NAVIGATION OF SPACE VLBI MISSIONS: RADIOASTRON AND VSOP
Jordan Ellis *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 625-628 (For primary document see N94-23832 06-66)
Avail: CASI HC A01/MF A10

In the mid-1990s, Russian and Japanese space agencies will each place into highly elliptic earth orbit a radio telescope consisting of a large antenna and radio astronomy receivers. Very long baseline interferometry (VLBI) techniques will be used to obtain high resolution images of radio sources observed by the space and ground based antennas. Stringent navigation accuracy requirements are imposed on the space VLBI missions by the need to transfer an ultra-stable ground reference frequency standard to the spacecraft and by the demands of the VLBI correlation process. Orbit determination for the mission will be the joint responsibility of navigation centers in the U.S., Russia, and Japan with orbit estimates based on combining tracking data from NASA, Russian, and Japanese sites. This paper describes the operational plans, the inter-agency coordination, and data exchange between the navigation centers required for space VLBI navigation. Author (revised)

THE GEO-CONTROL SYSTEM FOR STATION KEEPING AND COLOCATION OF GEOSTATIONARY SATELLITES c61
O. Montenbruck, M. C. Eckstein, and J. Gonner (Societe Europeenne des Satellites, Betzdorf, Luxembourg.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 629-634 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

GeoControl is a compact but powerful and accurate software system for station keeping of single and colocated satellites, which has been developed at the German Space Operations Center. It includes four core modules for orbit determination (including maneuver estimation), maneuver planning, monitoring of proximities between colocated satellites, and interference and event prediction. A simple database containing state vector and maneuver information at selected epochs is maintained as a central interface between the modules. A menu driven shell utilizing form screens for data input serves as the central user interface. The software is written in Ada and FORTRAN and may be used on VAX workstations or mainframes under the VMS operating system. Author (revised)

HISPASAT LAUNCH AND EARLY OPERATIONS PHASES: COMPUTATION AND MONITORING OF GEOSTATIONARY SATELLITE POSITIONING

Pascal Brousse and Arnaud Desprairies (MATRA Marconi Space, Toulouse, France.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 635-640 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Since 1974, CNES, the French National Space Agency, has been involved in the geostationary launch and early operations phases (LEOP) of moving satellites from a transfer orbit delivered by a launcher to a geostationary point. During the operations and their preparation, the Flight Dynamics Center (FDC), part of CNES LEOP facilities, is in charge of the space mechanics aspects. What is noteworthy about the Spanish HISPASAT satellite positioning is that all the operations were performed on the customer's premises, and consequently the FDC was duplicated in Madrid, Spain. The first part of this paper is the FDC presentation: its role, its hardware configuration, and its space dynamics ground control system called MERCATOR. The second part of this paper details the preparation used by the FDC for the HISPASAT mission: hardware and software installation in Madrid, integration with the other entities, and technical and operational qualifications. The third part gives results concerning flight dynamics aspects and operational activities. Author (revised)

INTELLIGENT TUTORING AND AIDING IN SATELLITE GROUND CONTROL Ph.D. Thesis - Georgia Inst. of Tech., 1991 **c54**

Rose W. Chu and Christine M. Mitchell (Georgia Inst. of Tech., Atlanta.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 645-650 (For primary document see N94-23832 06-66) (Contract NAS5-28575)
Avail: CASI HC A02/MF A10

In supervisory control systems such as satellite ground control, there is a need for human-centered automation where the focus is to understand and enhance the human-system interaction experience in the complex task environment. Operator support in the form of off-line intelligent tutoring and on-line intelligent aiding is one approach towards this effort. The tutor/aid paradigm is proposed here as a design approach that integrates the two aspects of operator support in one system for technically oriented adults in complex domains. This paper also presents GT-VITA, a proof-of-concept graphical, interactive, intelligent tutoring system that is a first attempt to illustrate the tutoring aspect of the tutor/aid paradigm in the domain of satellite ground control. Evaluation on GT-VITA is conducted with NASA personnel with very positive results. GT-VITA is presented being fielded as it is at Goddard Space Flight Center. Author (revised)

OPERABILITY ENGINEERING IN THE DEEP SPACE NETWORK

Belinda Wilkinson *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 651-654 (For primary document see N94-23832 06-66)
Avail: CASI HC A01/MF A10

Many operability problems exist at the three Deep Space Communications Complexes (DSCC's) of the Deep Space Network (DSN). Four years ago, the position of DSN Operability Engineer was created to provide the opportunity for someone to take a system-level approach to solving these problems. Since that time, a process has been developed for personnel and development engineers and for enforcing user interface standards in software designed for the DSCC's. Plans are for the participation of operations personnel in the product life-cycle to expand in the future. Author (revised)

THE APPLICATION OF TOTAL QUALITY MANAGEMENT PRINCIPLES TO SPACECRAFT MISSION OPERATIONS **c38**

Maury Sweetin *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 655-659 (For primary document see N94-23832 06-66)
Avail: CASI HC A01/MF A10

By now, the philosophies of Total Quality Management have had an impact on every aspect of American industrial life. The trail-blazing work of Deming, Juran, and Crosby, first implemented in Japan, has 're-migrated' across the Pacific and now plays a growing role in America's management culture. While initially considered suited only for a manufacturing environment, TQM has moved rapidly into the 'service' areas of offices, sales forces, and even fast-food restaurants. The next logical step has also been taken - TQM has found its way into virtually all departments of the Federal Government, including NASA. Because of this widespread success, it seems fair to ask whether this new discipline is directly applicable to the profession of spacecraft operations. The results of quality emphasis on OAO Corporation's contract at JPL provide strong support for Total Quality Management as a useful tool in spacecraft operations. Author (revised)

MISSION OPERATIONS AND COMMAND ASSURANCE: INSTILLING QUALITY INTO FLIGHT OPERATIONS **c38**

Linda L. Welz, Mona M. Witkowski, Kristin J. Bruno, and Sherrill S. Potts *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 661-666 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Mission Operations and Command Assurance (MO&CA) is a Total Quality Management (TQM) task on JPL projects to instill quality in flight mission operations. From a system engineering view, MO&CA facilitates communication and problem-solving among flight teams and provides continuous process improvement to reduce the probability of radiating incorrect commands to a spacecraft. The MO&CA task has evolved from participating as a member of the spacecraft team to an independent team reporting directly to flight project management and providing system level assurance. JPL flight projects have benefited significantly from MO&CA's effort to contain risk and prevent rather than rework errors. MO&CA's ability to provide direct transfer of knowledge allows new projects to benefit from previous and ongoing flight experience. Author

Operations 1 Mar. 1993 p 673-677 (For primary document see N94-23832 06-66)
Avail: CASI HC A01/MF A10

Training is commonly viewed as an add-on function to the development cycle. It is imperative that this view be changed. The training developer needs to be a colleague in the system development process, contributing and learning along with the other development participants. Training developers can make contributions to design concepts that favor end-users. Early involvement will enhance the likelihood of training availability concurrent with software delivery. End-users will benefit and cost-savings will be realized. Author (revised)

THE COLUMBUS LOGISTICS SUPPORT AT THE APMC: REQUIREMENTS AND IMPLEMENTATION ASPECTS
C. Canu, L. Battocchio (Alenia Spazio S.p.A., Turin, Italy.), and S. Masullo (Compagnia Italiana Servizi Tecnici, Rome.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 679-684 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

This paper focuses on the logistics support to be provided by the APM Center (APMC). Among the Columbus ground infrastructures, this center is tasked to provide logistics, sustaining engineering and P/L integration support to the ongoing missions of the APM, i.e. the Columbus Laboratory attached to the Freedom Space Station. The following is illustrated: an analysis of the requirements that are levied on the logistics support of the APM; how such requirements are reflected in the corresponding support to be available on-ground and at APMC; the functional components of the APMC logistics support and how such components interact each other; how the logistics support function interfaces with the other functions of the ground support; and how the logistics support is being designed in terms of resources (such as hardware, data bases, etc.). Emphasis is given to the data handling aspects and to the related data bases that will constitute for the logistics activities the fundamental source of information during the APM planned lifetime. Functional and physical architectures, together with trades for possible implementation, are addressed. Commonalities with other centers are taken into account and recommendations are made for possible reuse of tools already developed in the C/D phase. Finally, programmatic considerations are discussed for the actual implementation of the center. Author (revised)

AUTOMATING A HUMAN FACTORS EVALUATION OF GRAPHICAL USER INTERFACES FOR NASA APPLICATIONS: AN UPDATE ON CHIMES **c54**
Jian-Ping Jiang (Computer Technology Associates, Inc., Rockville, MD.), Elizabeth D. Murphy (Computer Technology Associates, Inc., Rockville, MD.), Sidney C. Bailin (Computer Technology Associates, Inc., Rockville, MD.), and Walter F. Truszkowski *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 685-690 Sponsored in part by NASA, Washington (For primary document see N94-23832 06-66)
(Contract NAS5-30680)
Avail: CASI HC A02/MF A10

Capturing human factors knowledge about the design of graphical user interfaces (GUI's) and applying this knowledge on-line are the primary objectives of the Computer-Human Interaction Models (CHIMES) project. The current CHIMES prototype is designed to check a GUI's compliance with industry-standard guidelines, general human factors guidelines, and human factors recommendations on color usage. Following the evaluation, CHIMES presents human factors feedback and advice to the GUI designer. The paper describes the approach to modeling human factors guidelines, the system architecture, a new method developed to convert quantitative RGB primaries into qualitative color representations, and the potential for integrating CHIMES with user interface management systems (UIMS). Both the conceptual approach and its implementation are discussed. This paper updates the presentation on CHIMES at the first International Symposium on Ground Data Systems for Spacecraft Control. SECURITY ASPECTS OF SPACE OPERATIONS DATA **c82**
Stefan Schmitz *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 691-696 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

This paper deals with data security. It identifies security threats to European Space Agency's (ESA) In Orbit Infrastructure Ground Segment (IOI GS) and proposes a method of dealing with its complex data structures from the security point of view. It is part of the 'Analysis of Failure Modes, Effects Hazards and Risks of the IOI GS for Operations, including Backup Facilities and Functions' carried out on behalf of the European Space Operations Center (ESOC). The security part of this analysis has been prepared with the following aspects in mind: ESA's large decentralized ground facilities for operations, the multiple organizations/users involved in the operations and the developments of ground data systems, and the large heterogeneous network structure enabling access to (sensitive) data which does involve crossing organizational boundaries. An IOI GS data objects classification is introduced to determine the extent of the necessary protection mechanisms. The proposal of security countermeasures is oriented towards the European 'Information Technology Security Evaluation Criteria (ITSEC)' whose hierarchically organized requirements can be directly mapped to the security sensitivity classification. MISSION AND SCIENCE ACTIVITY SCHEDULING LANGUAGE **c81**
Larry G. Hull *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 697-702 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

To support the distributed and complex operational scheduling required for future National Aeronautics and Space Administration (NASA) missions, a formal, textual language, the Scheduling Applications Interface Language (SAIL), has been developed. Increased geographic dispersion of investigators is leading to distributed mission and science activity planning, scheduling, and operations. SAIL is an innovation which supports the effective and efficient communication of scheduling information among physically dispersed applications in distributed scheduling environments. SAIL offers a clear, concise, unambiguous expression of scheduling information in a readable, hardware independent format. The language concept, syntax, and semantics incorporate language features found useful during five years of research and prototyping with scheduling languages in physically distributed environments. SAIL allows concise specification of mission and science activity plans in a format which promotes repetition and reuse. Author (revised)

SPECIFYING DESIGN CONSERVATISM: WORST CASE VERSUS PROBABILISTIC ANALYSIS **c38**
Ralph F. Miles, Jr. *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 703-709 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Design conservatism is the difference between specified and required performance, and is introduced when uncertainty is present. The classical approach of worst-case analysis for specifying design conservatism is presented, along with the modern approach of probabilistic analysis. The appropriate degree of design conservatism is a tradeoff between the required resources and the probability and consequences of a failure. A probabilistic analysis properly models this tradeoff, while a worst-case analysis reveals nothing about the probability of failure, and can significantly overstate the consequences of failure. Two aerospace examples will be presented that illustrate problems that can arise with a worst-case analysis. Author

SIMSAT: AN OBJECT ORIENTED ARCHITECTURE FOR REAL-TIME SATELLITE SIMULATION **c14**

Adam P. Williams *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 711-716 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Real-time satellite simulators are vital tools in the support of satellite missions. They are used in the testing of ground control systems, the training of operators, the validation of operational procedures, and the development of contingency plans. The simulators must provide high-fidelity modeling of the satellite, which requires detailed system information, much of which is not available until relatively near launch. The short time-scales and resulting high productivity required of such simulator developments culminates in the need for a reusable infrastructure which can be used as a basis for each simulator. This paper describes a major new simulation infrastructure package, the Software Infrastructure for Modelling Satellites (SIMSAT). It outlines the object oriented design methodology used, describes the resulting design, and discusses the advantages and disadvantages experienced in applying the methodology. Author (revised)

USING SFOC TO FLY THE MAGELLAN VENUS MAPPING MISSION
Allen W. Bucher, Robert E. Leonard, Jr., and Owen G. Short *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 721-726 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Traditionally, spacecraft flight operations at the Jet Propulsion Laboratory (JPL) have been performed by teams of spacecraft experts utilizing ground software designed specifically for the current mission. The Jet Propulsion Laboratory set out to reduce the cost of spacecraft mission operations by designing ground data processing software that could be used by multiple spacecraft missions, either sequentially or concurrently. The Space Flight Operations Center (SFOC) System was developed to provide the ground data system capabilities needed to monitor several spacecraft simultaneously and provide enough flexibility to meet the specific needs of individual projects. The Magellan Spacecraft Team utilizes the SFOC hardware and software designed for engineering telemetry analysis, both real-time and non-real-time. The flexibility of the SFOC System has allowed the spacecraft team to integrate their own tools with SFOC tools to perform the tasks required to operate a spacecraft mission. This paper describes how the Magellan Spacecraft Team is utilizing the SFOC System in conjunction with their own software tools to perform the required tasks of spacecraft event monitoring as well as engineering data analysis and trending.

LONG TERM TRENDING OF ENGINEERING DATA FOR THE HUBBLE SPACE TELESCOPE **c89**
Ross M. Cox *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 727-732 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

A major goal in spacecraft engineering analysis is the detection of component failures before the fact. Trending is the process of monitoring subsystem states to discern unusual behaviors. This involves reducing vast amounts of data about a component or subsystem into a form that helps humans discern underlying patterns and correlations. A long term trending system has been developed for the Hubble Space Telescope. Besides processing the data for 988 distinct telemetry measurements each day, it produces plots of 477 important parameters for the entire 24 hours. Daily updates to the trend files also produce 339 thirty day trend plots each month. The total system combines command procedures to control the execution of the C-based data processing program, user-written FORTRAN routines, and commercial off-the-shelf plotting software. This paper includes a discussion the performance of the trending system and of its limitations.

EXPERT DIAGNOSTICS SYSTEM AS A PART OF ANALYSIS SOFTWARE FOR POWER MISSION OPERATIONS
Jennifer A. Harris and Khosrow A. Bahrami *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 739-744 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The operation of interplanetary spacecraft at JPL has become an increasingly complex activity. This complexity is due to advanced spacecraft designs and ambitious mission objectives which lead to operations requirements that are more demanding than those of any previous mission. For this reason, several productivity enhancement measures are underway at JPL within mission operations, particularly in the spacecraft analysis area. These measures aimed at spacecraft analysis include: the development of a multi-mission, multi-subsystem operations environment; the introduction of automated tools into this environment; and the development of an expert diagnostics system. This paper discusses an effort to integrate the above mentioned productivity enhancement measures. A prototype was developed that integrates an expert diagnostics system into a multi-mission, multi-subsystem operations environment using the Galileo Power / Pyro Subsystem as a testbed. This prototype will be discussed in addition to background information associated with it. Author (revised)

GENSAA: A TOOL FOR ADVANCING SATELLITE MONITORING WITH GRAPHICAL EXPERT SYSTEMS
Peter M. Hughes and Edward C. Luczak (Computer Sciences Corp., Beltsville, MD.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 745-750 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

During numerous contacts with a satellite each day, spacecraft analysts must closely monitor real time data for combinations of telemetry parameter values, trends, and other indications that may signify a problem or failure. As satellites become more complex and the number of data items increases, this task is becoming increasingly difficult for humans to perform at acceptable performance levels. At the NASA Goddard Space Flight Center, fault-isolation expert systems have been developed to support data monitoring and fault detection tasks in satellite control centers. Based on the lessons learned during these initial efforts in expert system automation, a new domain-specific expert system development tool named the Generic Spacecraft Analyst Assistant (GenSAA) is being developed to facilitate the rapid development and reuse of real-time expert systems to serve as fault-isolation assistants for spacecraft analysts. Although initially domain-specific in nature, this powerful tool will support the development of highly graphical expert systems for data monitoring purposes throughout the space and commercial industry. ORBITAL SIGNATURE ANALYZER (OSA): A SPACECRAFT HEALTH/SAFETY MONITORING AND ANALYSIS TOOL c17

Steven Weaver (Computer Sciences Corp., Laurel, MD.), Charles DeGeorges (Computer Sciences Corp., Laurel, MD.), Joy Bush (Computer Sciences Corp., Laurel, MD.), Robert Shendock (TRW, Inc., Redondo Beach, CA.), and Daniel Mandl *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 757-761 (For primary document see N94-23832 06-66)

Avail: CASI HC A01/MF A10

Fixed or static limit sensing is employed in control centers to ensure that spacecraft parameters remain within a nominal range. However, many critical parameters, such as power system telemetry, are time-varying and, as such, their 'nominal' range is necessarily time-varying as well. Predicted data, manual limits checking, and widened limit-checking ranges are often employed in an attempt to monitor these parameters without generating excessive limits violations. Generating predicted data and manual limits checking are both resource intensive, while broadening limit ranges for time-varying parameters is clearly inadequate to detect all but catastrophic problems. OSA provides a low-cost solution by using analytically selected data as a reference upon which to base its limits. These limits are always defined relative to the time-varying reference data, rather than as fixed upper and lower limits. In effect, OSA provides individual limits tailored to each value throughout all the data. A side benefit of using relative limits is that they automatically adjust to new reference data. In addition, OSA provides a wealth of analytical by-products in its execution. Author

EOS GROUND DATA SYSTEMS: A DESCRIPTION AND INTERFACE OVERVIEW

Gene Smith *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 767-772 (For primary document see N94-23832 06-66)

Avail: CASI HC A02/MF A10

The Earth Observing System (EOS) is planned as a space-based measurement system, earth-science research program, and data and information system (EOSDIS). It will consist of several high data rate spacecraft with multiple earth sensing instruments which provide investigators with a thorough, longterm view of the earth's environment. Up to seven spacecraft may be supported at once, either in operational, checkout, or testing phases; and the average data rate from the EOS satellites in orbit at any one time is expected to be from 18 to 60 Mbps. Providing the data processing and flight operations support for EOS will be the EOSDIS Core System (ECS). The ECS will command and control the spacecraft; process and store the EOS data; provide access to the data for years; and support researchers. The data processing aspects of the ECS consist of a collection of Distributed Active Archive Centers (DAAC's) which perform the product generation, data archive and distribution, and information management services. Flight operations aspects will be provided by the EOS Operations Center, by instrument control centers, and by widely distributed instrument support terminals. The communications and system management aspects will be provided by the EOSDIS Science Network and the System Management Center. In addition to the EOS satellite data, other data sets from earlier earth science missions are also to be added to designated DAAC's. Other ground data systems which will provide support to EOS for acquiring, transporting, processing, and distributing the transformed spacecraft data are currently being defined or are being upgraded for the EOS era. These systems include the Space Network consisting of the Tracking and Data Relay Satellite System (TDRSS), the TDRSS Ground Terminals, and the Network Control Center as well as the night Dynamics Facility, the EOS Data and Operations System, and EOS Communications. This paper briefly describes data handling by the ECS, the support data systems, their interfaces, and their roles. Author

TELEMETRY GROUND SYSTEM DEVELOPMENT VIA THE COMPONENT APPROACH c17

Karen E. Thorn *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 773-778 (For primary document see N94-23832 06-66)

Avail: CASI HC A02/MF A10

NASA's deployment of major space projects such as the Earth Observing System (EOS) will demand increased functionality and ground-based telemetry processing performance well above current capabilities. At the NASA/Goddard Space Flight Center, custom hardware and software components have been developed and combined into a unique architecture to address this problem. The hardware components utilize Application Specific Integrated Circuits (ASIC's) developed specifically to support NASA's telemetry data systems needs and designed to handle data rates up to 300 Mbps. A generalized set of software components, called the Telemetry Processing Control Environment facilitate the rapid construction of control and monitoring functions for the ground-based telemetry processing systems. This combination of hardware and software elements enables rapid construction of flexible, cost-effective telemetry processing systems capable of meeting the performance requirements facing NASA in the coming decade. USING THE SPICE SYSTEM TO HELP PLAN AND INTERPRET SPACE SCIENCE OBSERVATIONS c82

Charles H. Acton, Jr. *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 781-786 (For primary document see N94-23832 06-66)

Avail: CASI HC A02/MF A10

A portable multimission information system named SPICE is used to assemble, archive, and provide easy user access to viewing geometry and other ancillary information needed by space scientists to interpret observations of bodies within our solar system. The modular nature of this system lends it to use in planning such observations as well. With a successful proof of concept on Voyager, the SPICE system has been adapted to the Magellan, Galileo and Mars Observer missions, and to a variety of ground based operations. Adaptation of SPICE for Cassini and the Russian Mars 94/96 projects is underway, and work on Cassini will follow, SPICE has been used to support observation planning for moving targets on the Hubble Space Telescope Project. Applications for SPICE on earth science, space physics and other astrophysics missions are under consideration. Author

AN ENGINEERING DATABASE MANAGEMENT SYSTEM FOR SPACECRAFT OPERATIONS c82

Gregorio Cipollone, Michael H. McKay, and Joseph Paris (BIM SA/NV, Everberg, Belgium.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 787-790 (For primary document see N94-23832 06-66)

Avail: CASI HC A01/MF A10

Studies at ESOC have demonstrated the feasibility of a flexible and powerful Engineering Database Management System in support for spacecraft operations documentation. The objectives set out were three-fold: first an analysis of the problems encountered by the Operations team in obtaining and managing operations documents; secondly, the definition of a concept for operations documentation and the implementation of prototype to prove the feasibility of the concept; and thirdly, definition of standards and protocols required for the exchange of data between the top-level partners in a satellite project. The EDMS prototype was populated with ERS-I satellite design data and has been used by the operations team at

ESOC to gather operational experience. An operational EDMS would be implemented at the satellite prime contractor's site as a common database for all technical information surrounding a project and would be accessible by the cocontractor's and ESA teams. Author

THE ESIS QUERY ENVIRONMENT PILOT PROJECT c82
Jens J. Fuchs, Alessandro Ciarlo (European Space Agency. ESRIN, Frascati, Italy.), and Stefano Benso (Compagnia Italiana Servizi Tecnici, Rome.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 791-801 (For primary document see N94-23832 06-66)
Avail: CASI HC A03/MF A10

The European Space Information System (ESIS) was originally conceived to provide the European space science community with simple and efficient access to space data archives, facilities with which to examine and analyze the retrieved data, and general information services. To achieve that ESIS will provide the scientists with a discipline specific environment for querying in a uniform and transparent manner data stored in geographically dispersed archives. Furthermore it will provide discipline specific tools for displaying and analyzing the retrieved data. The central concept of ESIS is to achieve a more efficient and wider usage of space scientific data, while maintaining the physical archives at the institutions which created them, and has the best background for ensuring and maintaining the scientific validity and interest of the data. In addition to coping with the physical distribution of data, ESIS is to manage also the heterogenity of the individual archives' data models, formats and data base management systems. Thus the ESIS system shall appear to the user as a single database, while it does in fact consist of a collection of dispersed and locally managed databases and data archives. The work reported in this paper is one of the results of the ESIS Pilot Project which is to be completed in 1993. More specifically it presents the pilot ESIS Query Environment (ESIS QE) system which forms the data retrieval and data dissemination axis of the ESIS system. The others are formed by the ESIS Correlation Environment (ESIS CE) and the ESIS Information Services. The ESIS QE Pilot Project is carried out for the European Space Agency's Research and Information center, ESRIN, by a Consortium consisting of Computer Resources International, Denmark, CISET S.p.a, Italy, the University of Strasbourg, France and the Rutherford Appleton Laboratories in the U.K. Furthermore numerous scientists both within ESA and space science community in Europe have been involved in defining the core concepts of the ESIS system. MARS OBSERVER DATA PRODUCTION, TRANSFER, AND ARCHIVAL: THE DATA PRODUCTION ASSEMBLY LINE c82
David B. Childs *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 803-811 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

This paper describes the data production, transfer, and archival process designed for the Mars Observer Flight Project. It addresses the developmental and operational aspects of the archive collection production process. The developmental aspects cover the design and packaging of data products for archival and distribution to the planetary community. Also discussed is the design and development of a data transfer and volume production process capable of handling the large throughput and complexity of the Mars Observer data products. The operational aspects cover the main functions of the process: creating data and engineering products, collecting the data products and ancillary products in a central repository, producing archive volumes, validating volumes, archiving, and distributing the data to the planetary community. Avail: CASI HC A02/MF A10

A Technological DataBase (T.D.B.) records all the values taken by the physical on-board parameters of a satellite since launch time. The amount of temporal data is very large (about 15 Gbytes for the satellite TDF1) and an efficient system must allow users to have a fast access to any value. This paper presents a new solution for T.D.B. management. The main feature of our new approach is the use of lossless data compression methods. Several parametrizable data compression algorithms based on substitution, relative difference and run-length encoding are available. Each of them is dedicated to a specific type of variation of the parameters' values. For each parameter, an analysis of stability is performed at decommutation time, and then the best method is chosen and run. A prototype intended to process different sorts of satellites has been developed. Its performances are well beyond the requirements and prove that data compression is both time and space efficient. For instance, the amount of data for TDF1 has been reduced to 1.05 Gbytes (compression ratio is 1/13) and access time for a typical query has been reduced from 975 seconds to 14 seconds. Author

SPACE STATION FREEDOM GROUND DATA SYSTEM: DESIGN AND OPERATIONS c82
Richard A. Dunning, Jr. (Booz-Allen and Hamilton, Inc., Washington, DC.), Frederick W. Knops, III (Booz-Allen and Hamilton, Inc., Seabrook, MD.), Stanley A. Fishkind, and Michael P. Pasciuto *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 831-836 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Over the previous year the Space Station Freedom (SSF) Program (SSFP) ground data distribution system has become independent of a number of data systems that were to have been provided by other National Aeronautics and Space Administration (NASA) programs. Consequently, the SSFP has outlined the basic architecture of a new data system dedicated to supporting SSF requirements. This has been accomplished through a complete redesign of the ground network and a reallocation of selected functions. There are a number of aspects of the new ground data distribution system that are unique among NASA programs. These considerations make SSF ground data distribution one of the most extensive and complex data management challenges encountered in the arena of Space Operations. A description of this system comprises the main focus of the paper. Author

OPERATIONAL CHARACTERISATION OF REQUIREMENTS AND EARLY VALIDATION ENVIRONMENT FOR HIGH DEMANDING SPACE SYSTEMS **c82**

E. Barro, A. DelBufalo, and F. Rossi *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 845-850 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The definition of some modern high demanding space systems requires a different approach to system definition and design from that adopted for traditional missions. System functionality is strongly coupled to the operational analysis, aimed at characterizing the dynamic interactions of the flight element with its surrounding environment and its ground control segment. Unambiguous functional, operational and performance requirements are to be defined for the system, thus improving also the successive development stages. This paper proposes a Petri Nets based methodology and two related prototype applications (to ARISTOTELES orbit control and to Hermes telemetry generation) for the operational analysis of space systems through the dynamic modeling of their functions and a related computer aided environment (ISIDE) able to make the dynamic model work, thus enabling an early validation of the system functional representation, and to provide a structured system requirements data base, which is the shared knowledge base interconnecting static and dynamic applications, fully traceable with the models and interfaceable with the external world. TOWARD LOWERING THE COST OF MISSION OPERATIONS

S. D. Wall (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) and K. W. Ledbetter *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 851-855 (For primary document see N94-23832 06-66)
Avail: CASI HC A01/MF A10

The mission operations system is one of the more significant drivers of the cost of the mission operations and data analysis segment of missions. In large or long-lived projects, the MOS can also be a driver in total mission cost. Larger numbers of missions, together with an increasingly cost-conscious environment, dictate that future missions must more strictly control costs as they perform to their requirements. It is therefore prudent to examine the conduct of past missions for ways to conserve resources. In this paper we review inputs made to past projects' 'lessons-learned' activities, in which personnel from past projects (among other things) identified major cost drivers of MOS's and considered how economies were or might have been realized in both design and performance of their MOS. Common themes among four such reviews are summarized in an attempt to provide suggestions for cost reduction in future missions. Author

NEW MISSION REQUIREMENTS METHODOLOGIES FOR SERVICES PROVIDED BY THE OFFICE OF SPACE COMMUNICATIONS

Dwight P. Holmes (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), J. R. Hall (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), William Macoughtry, and Robert Spearing (Telos Corp., Chantilly, VA.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 857-862 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The Office of Space Communications, NASA Headquarters, has recently revised its methodology for receiving, accepting and responding to customer requests for use of that office's tracking and communications capabilities. This revision is the result of a process which has become over-burdened by the size of the currently active and proposed missions set, requirements reviews that focus on single missions rather than on mission sets, and negotiations most often not completed early enough to effect needed additions to capacity or capability prior to launch. The requirements-coverage methodology described is more responsive to project/program needs and provides integrated input into the NASA budget process early enough to effect change, and describes the mechanisms and tools in place to insure a value-added process which will benefit both NASA and its customers. Key features of the requirements methodology include the establishment of a mechanism for early identification of and systems trades with new customers, and delegates the review and approval of requirements documents to NASA centers in lieu of Headquarters, thus empowering the system design teams to establish and negotiate the detailed requirements with the user. A Mission Requirements Request (MRR) is introduced to facilitate early customer interaction. The expected result is that the time to achieve an approved set of implementation requirements which meet the customer's needs can be greatly reduced. Finally, by increasing the discipline in requirements management, through the use of base lining procedures, a tighter coupling between customer requirements and the budget is provided. A twice-yearly projection of customer requirements accommodation, designated as the Capacity Projection Plan (CPP), provides customer feedback allowing the entire mission set to be serviced. Author

FROM REQUIREMENTS TO ACCEPTANCE TESTS **c61**

Lionel Baize and Helene Pasquier *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 863-866 (For primary document see N94-23832 06-66)
Avail: CASI HC A01/MF A10

From user requirements definition to accepted software system, the software project management wants to be sure that the system will meet the requirements. For the development of a telecommunication satellites Control Centre, C.N.E.S. has used new rules to make the use of tracing matrix easier. From Requirements to Acceptance Tests, each item of a document must have an identifier. A unique matrix traces the system and allows the tracking of the consequences of a change in the requirements. A tool has been developed, to import documents into a relational data base. Each record of the data base corresponds to an item of a document, the access key is the item identifier. Tracing matrix is also processed, providing automatically links between the different documents. It enables the reading on the same screen of traced items. For example one can read simultaneously the User Requirements items, the corresponding Software Requirements items and the Acceptance Tests. Author

RESOURCE ALLOCATION PLANNING WITH INTERNATIONAL COMPONENTS **c81**
Gene Burke, Ralph Durham, Frank Leppla, and David Porter (California Inst. of Tech., Pasadena.) *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 867-874 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

Dumas, Briggs, Reid and Smith (1989) describe the need for identifying mutually acceptable methodologies for developing standard agreements for the exchange of tracking time or facility use among international components. One possible starting point is the current process used at the Jet Propulsion Laboratory (JPL) in planning the use of tracking resources. While there is a significant promise of better resource utilization by international cooperative agreements, there is a serious challenge to provide convenient user participation given the separate project and network locations. Coordination among users and facility providers will require a more decentralized communication process and a wider variety of automated planning tools to help users find potential exchanges. This paper provides a framework in which international cooperation in the utilization of ground based space communication systems can be facilitated. Author

(Contract NAS5-27772)
Avail: CASI HC A02/MF A10

A new, intelligent planning and scheduling system has been delivered to NASA-Goddard Space Flight Center (GSFC) to provide support for the up-coming Hubble Space Telescope (HST) Servicing Missions. This new system is the Servicing Mission Planning and Replanning Tool (SM/PART). SM/PART is written in C and runs on a UNIX-based workstation (IBM RS/6000) under Motif. SM/PART effectively automates the complex task of building or rebuilding integrated timelines and command plans which are required by HST Servicing Mission personnel at their consoles during the missions. SM/PART is able to quickly build or rebuild timelines based on information stored in a Knowledge Base (KB) by using an Artificial Intelligence (AI) tool called the Planning And Resource Reasoning (PARR) shell. After a timeline has been built in the batch mode, it can be displayed and edited in an interactive mode with help from the PARR shell. Finally a detailed command plan is generated. The capability to quickly build or rebuild timelines and command plans provides an additional safety factor for the HST, Shuttle and Crew. Author

SCHEDULING THE FUTURE NASA SPACE NETWORK: EXPERIENCES WITH A FLEXIBLE SCHEDULING PROTOTYPE **c81**
Nadine Happell (Stanford Telecommunications, Inc., Reston, VA.), Karen L. Moe, and Jay Minnix (Stanford Telecommunications, Inc., Reston, VA.) *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 881-886 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

NASA's Space Network (SN) provides telecommunications and tracking services to low earth orbiting spacecraft. One proposal for improving resource allocation and automating conflict resolution for the SN is the concept of flexible scheduling. In this concept, each Payload Operations Control Center (POCC) will possess a Space Network User POCC Interface (SNUPI) to support the development and management of flexible requests. Flexible requests express the flexibility, constraints, and repetitious nature of the user's communications requirements. Flexible scheduling is expected to improve SN resource utilization and user satisfaction, as well as reduce the effort to produce and maintain a schedule. A prototype testbed has been developed to better understand flexible scheduling as it applies to the SN. This testbed consists of a SNUPI workstation, an SN scheduler, and a flexible request language that conveys information between the two systems. All three are being evaluated by operations personnel. Benchmark testing is being conducted on the scheduler to quantify the productivity improvements achieved with flexible requests. Author

The use of a software toolkit and development methodology that supports software reuse is described. The toolkit includes source-code-level library modules and stand-alone tools which support such tasks as data reformatting and report generation, simple relational database applications, user interfaces, tactical planning, strategic planning and documentation. The current toolkit is written in C and supports applications that run on IBM-PC's under DOS and UNIX-based workstations under OpenLook and Motif. The toolkit is fully integrated for building scheduling systems that reuse AI knowledge base technology. A typical scheduling scenario and three examples of applications that utilize the reuse toolkit will be briefly described. In addition to the tools themselves, a description of the software evolution and reuse methodology that was used is presented. Author

PLANNING: MANAGEMENT OF PREDICTABILITY AND UNCERTAINTY AND KEEPING ABREAST OF DEVELOPMENTS **c81**
Christophe Bastien-Thiry and Gerard Verfaillie *In* JPL, SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data Systems for Space Mission Operations 1 Mar. 1993 p 893-898 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

The purpose of this study is to propose method to set up and control of a space mission plan such as that of the HERMES spaceplane. The interest of this subject, other than its complexity, is due to the need to manage imprecision and uncertainty during a mission, as well as changes in between missions. Under these conditions, the set up and control of a flight plan require certain special attention and this has led us to define a certain number of qualities: mastery of complexity in order to resolve conflicts between activities: configuration, resource and time management; consideration of various criteria such as risk minimization or the attainment of mission objectives; robustness and flexibility to allow for hazards and deviations from the norm during operation without having to draw up new plans; aptness for replanning by making changes to the plan without having to set up the whole plan again; and memorization and explanation facility in order to manage developments between missions. ESTIMATING THE DEEP SPACE NETWORK MODIFICATION COSTS TO PREPARE FOR FUTURE SPACE MISSIONS BY USING MAJOR COST DRIVERS **c83**
Donald S. Remer, Josef Sherif, and Harry R. Buchanan *In its* SpaceOps 1992: Proceedings of the Second International Symposium on Ground Data

Systems for Space Mission Operations 1 Mar. 1993 p 899-904 (For primary document see N94-23832 06-66)
Avail: CASI HC A02/MF A10

This paper develops a cost model to do long range planning cost estimates for Deep Space Network (DSN) support of future space missions. The paper focuses on the costs required to modify and/or enhance the DSN to prepare for future space missions. The model is a function of eight major mission cost drivers and estimates both the total cost and the annual costs of a similar future space mission. The model is derived from actual cost data from three space missions: Voyager (Uranus), Voyager (Neptune), and Magellan. Estimates derived from the model are tested against actual cost data for two independent missions, Viking and Mariner Jupiter/Saturn (MJS). Author

CONTROLLABILITY OF FREE-PISTON STIRLING ENGINE/LINEAR ALTERNATOR DRIVING A DYNAMIC LOAD
M. David Kankam and Jeffrey S. Rauch (Sverdrup Technology, Inc., Brook Park, OH.) Feb. 1994 9 p Presented at the 28th Intersociety Energy Conversion Engineering Conference, Atlanta, GA, 8-13 Aug. 1993; sponsored by ANS, SAE, ACS, IEEE, ASME, AIAA, and AIChE
(Contract NAS3-25266; RTOP 590-13-11)
(NASA-TM-106497; E-8488; NAS 1.15:106497) Avail: CASI HC A02/MF A01

This paper presents the dynamic behavior of a Free-Piston Stirling Engine/linear alternator (FPSE/LA) driving a single-phase fractional horse-power induction motor. The controllability and dynamic stability of the system are discussed by means of sensitivity effects of variations in system parameters, engine controller, operating conditions, and mechanical loading on the induction motor. The approach used expands on a combined mechanical and thermodynamic formulation employed in a previous paper. The application of state-space technique and frequency domain analysis enhances understanding of the dynamic interactions. Engine-alternator parametric sensitivity studies, similar to those of the previous paper, are summarized. Detailed discussions are provided for parametric variations which relate to the engine controller and system operating conditions. The results suggest that the controllability of a FPSE-based power system is enhanced by proper operating conditions and built-in controls. Author

REDUCED GAME PROPERTIES OF EGALITARIAN DIVISION RULES FOR COOPERATIVE GAMES
T. S. H. Driessen and Y. Funaki Jun. 1993 32 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-111689; MEMO-1136) Avail: Issuing Activity (National Technical Information Service (NTIS))

The egalitarian non-individual contribution (ENIC) value represents the equal division of the surplus of the total profits, given that each player is already allocated some kind of a yet unspecified individual contribution. Four particular versions of the ENIC-value are also considered by specifying the notion of individual contribution. An axiomatic characterization of the ENIC-value is provided on the class of cooperative games with a fixed player set as well as a variable player set. The latter axiomatization involves a consistency axiom in terms of reduced games. NTIS

NEW ADVANCES IN MISSION PLANNING AND REHEARSAL SYSTEMS [LES NOUVELLES APPROCHES POUR LES SYSTEMES DE PLANIFICATION ET DE SIMULATION DES MISSIONS]
Oct. 1993 125 p Lectures held in Kjeller, Norway, 11-12 Oct. 1993, in Madrid, Spain, 14-15 Oct. 1993, and in Hanscom AFB, MA, 28-29 Oct. 1993
(AGARD-LS-192; ISBN-92-835-0723-1) Copyright Avail: CASI HC A06/MF A02

Modern data processing technology with greatly enhanced capabilities is being used in both the airborne and ground-based segments of the NATO Air Forces. A key element in the interface between these segments is provided by the mission planning systems which are used to analyze, fuse, and refine the information at air bases. The synergy of modern avionics systems and ground-based data networks cannot be fully realized unless mission data are provided effectively and rapidly to aircraft before the mission is commenced. Aircrew workloads must be minimized by the development of user-friendly planning systems which incorporate rehearsal facilities. To present some of the design and engineering aspects of mission planning systems, with particular emphasis on human factors considerations, examples of modern mission planning and rehearsal systems will be described. For individual titles, see N94-25009 through N94-25016.

This paper describes the fundamental system concepts that are useful in addressing future growth areas of mission planning systems as reported in Section 2.1 of the AGARD Advisory Report 313 'Mission Planning Systems for Tactical Aircraft' (Pre-Flight and In-Flight). A significant requirement for mission planning systems, especially for autonomous vehicles, is the ability to quickly plan and/or replan a complex task or mission. Fast, efficient replanning is especially important because the state of the world can change abruptly and radically during the course of a mission. Mission planning systems must embody the capabilities necessary to swiftly replan actions in order to accommodate a vehicle's changing health or environment while continuing to pursue mission objectives. The complexity of mission planning problems has led to the use of hierarchical decompositions to make those problems manageable. The hierarchical approach to decision-making decomposes a large problem into a number of separate levels or sub-problems, thereby reducing the overall complexity, ideally without compromising overall system performance. In this lecture paper, an architecture for a mission planning system is presented with descriptions of the associated planning algorithms and planning management functions. Author (revised)

Human factors of advanced Mission Planning Systems (MPS) are considered from a theoretical and conceptual point of view. MPS's are treated as a class of human-machine systems concerned with the functions of planning and rehearsal of mission tasks. The functions of planning and rehearsal are considered in relation to decision-making and actions in dynamic situations. Planning and rehearsal are essential for the identification and clarification of mission goals. Planning and rehearsal are cognitive tasks involving the skills of reasoning, decision-making, visualization, and mental simulation, with associated human capabilities and limitations. Performance of these preparatory cognitive skills reduces in-flight workload and affects the availability, quality, and structure of mission-relevant knowledge. Knowledge and understanding gained during planning influences the performance of in-flight mission tasks. Perceptions of mission problems and situations are initially formulated during planning and rehearsal. Inappropriate perceptions result in inappropriate plans, reduced in-flight situational awareness, erroneous decisions, and degraded mission performance. The psychology of systems design is reviewed with reference to MPS requirements. Particular attention is given to the role of automation and aiding technology in the performance of planning and rehearsal tasks. The nature of air crew involvement in MPS decision making is a key system design issue determining mission effectiveness. Relevant human capabilities and limitations, and the level of air crew active involvement and machine autonomy, need to be carefully considered in initial systems design. A human-systems design paradigm based on principles of adaptive aiding and co-operative functioning is proposed for advanced MPS design. The cognitive compatibility of the air crew task and system interface is a key requirement for effective air crew involvement in MPS processes and for successful MPS functioning. Author (revised)

HUMAN FACTORS OF MISSION PLANNING SYSTEMS: APPLICATIONS AND IMPLEMENTATION
I. Ross *In* AGARD, New Advances in Mission Planning and Rehearsal Systems Oct. 1993 7 p (For primary document see N94-25008 06-66)
Copyright Avail: CASI HC A02/MF A02

It was apparent from the beginning of the work carried out by the Joint Working Group in Phase One, that the successful application and implementation of human factors considerations were an essential part of the design of Mission Planning Systems (MPS). Although these considerations were discussed in Phase One, in Phase Two human factors were investigated in greater detail. It was considered essential that, as with all systems design, a full understanding of the information requirements and information flow of MPS's in Pre-flight, In-flight, and Post-flight situations was understood, as well as the dependencies under which the system must operate. Ideally, each component should be complimentary and be designed in accordance with requirements of each component as well as the 'mission' system as a whole. The Phase One report included descriptions of the emerging MPS including the ergonomics and the interface of each system. There was a high degree of similarity apparent in both approach and implementation. The Phase Two report explored many of the issues raised in greater detail, particularly that of trust that aircrew must have in the systems and the subsequently planned mission and the interface through which the user must communicate with the system. COMPUTING TECHNIQUES IN MISSION PLANNING
Stephan E. Kolitz *In* AGARD, New Advances in Mission Planning and Rehearsal Systems Oct. 1993 20 p (For primary document see N94-25008 06-66)
Copyright Avail: CASI HC A03/MF A02

This lecture paper addresses issues related to the major concern stated in Section 5.1 of the AGARD Advisory Report 313 'Mission Planning Systems for Tactical Aircraft (Pre-Flight and In-Flight).' A major concern involving all aspects of mission planning systems is the tremendous computational burden that is required for a wide variety of mission planning functions. The approaches for solving the Mission Planning Problem can generally be grouped into two categories: approaches that guarantee optimality; and heuristic approaches that do not guarantee optimality. Useful solution methodologies can be characterized by polynomial running time complexity. This paper concentrates on computational issues that arise when using hierarchical decomposition to solve the Mission Planning Problem. An analytic methodology and sample analyses are presented for an abstract planning system. Author (revised)

Recent years have witnessed a very rapid growth in the power of computer-based systems of all types. This rapid growth has been based on faster devices, better interfaces, and the use of parallel processing. Mission planning systems have shared in this evolution and there is every reason to believe that, for the medium term at least, this increase in power will continue. The effective use of this power by the user implies that a proper collaboration is established between the user (man) and the system (machine) which can utilize to the maximum the particular capabilities of each. This requires that the greatest attention is given to the design of the interface between machine and user since the interface can significantly constrain the overall performance of the man-machine system. This lecture describes the man-machine interface technologies which are currently available to the developer of mission planning systems and provides descriptions of some of the advances in these technologies which are expected to become available in the short to medium term. For complex combined missions, it has been necessary for Ground Based Mission Planning to be performed as close to the individual mission as possible. With the advent of intelligent Automated Mission Planning Systems (AMPS) and reliable, secure communications, the speed of data exchange and completion of the subsequent mission planning has greatly increased. This paper outlines the mission cycle and briefly examines a range of mission tasking activity. This framework is used to describe a possible operating base tasking and planning system architecture, within which the AMPS architecture is explained. Typical AMPS databases and functions are examined before a description of the actual task definition and mission planning processes. Mission validation and rehearsal capabilities are outlined, and the range of data outputs is examined. The paper concludes by briefly explaining the archiving of the resulting data. Author (revised)

This paper describes the functional aspects and the engineering guidelines of an in-flight mission planning system. The system is being developed as a part of the French project known as 'Electronic Copilot.' This project is lead by Dassault Aviation with the support of French official services (DRET STTE) and involves many industrial and scientific partners. Emphasis is put on the in-flight Pilot-System relationship and dynamic task allocation. A few words are said about knowledge acquisition methodologies and tools that are suitable for the development of a cognitive planning assistant. Author (revised)

TIMED COLOURED PETRI NETS AND THEIR APPLICATION TO LOGISTICS Ph.D. Thesis
Willibrordus M. P. vanderAalst 1992 277 p
(ETN-94-95310) Avail: CASI HC A13/MF A03

The modeling and analysis of complex logistic systems are studied. An approach based on a timed colored Petri net model is presented. The Petri net concept meets the requirements set out by the distributed nature of a logistic system. The addition of color and time enables the modeling of data structures and a complex temporal behavior. A major advantage compared to other methods is the availability of various kinds of analysis. The interval timed colored Petri nets model is described. The semantics of this model is given in terms of a transition system. To do this, some basic notations and concepts are introduced. Three of the four analysis methods, developed to analyze interval timed colored Petri nets, are presented. These methods are compared with existing analysis methods. It is shown how these methods can be used to analyze interval timed colored Petri nets with large color sets. The language ExSpect and the tools developed to support this language are described. The field of logistics and the application of Petri nets to logistic problems are presented. A library containing logistic building blocks is included. The usefulness of the approach is discussed. (DE94-002285; LBL-34507; UCB-PTH-93/26) Avail: CASI HC A08/MF A02

This thesis is primarily a study of certain aspects of the geometric and algebraic structure of coadjoint orbit representations of infinite-dimensional Lie groups. The goal of this work is to use coadjoint orbit representations to construct conformal field theories, in a fashion analogous to the free-field constructions of conformal field theories. The new results which are presented in this thesis are as follows: first, an explicit set of formulae are derived giving an algebraic realization of coadjoint orbit representations in terms of differential operators acting on a polynomial Fock space. These representations are equivalent to dual Verma module representations. Next, intertwiners are explicitly constructed which allow the construction of resolutions for irreducible representations using these Fock space realizations. Finally, vertex operators between these irreducible representations are explicitly constructed as chain maps between the resolutions; these vertex operators allow the construction of rational conformal field theories according to an algebraic prescription. VALIDATING IDENTIFIED NONLINEAR MODELS WITH CHAOTIC DYNAMICS
Luis A. Aguirre and S. A. Billings Mar. 1993 32 p
(Grants CNPq-200597/90-6; SERC-GR/H-35286)
(RR-469; ETN-94-95136) Avail: CASI HC A03/MF A01

The effectiveness of several criteria for validating models which exhibit chaotic dynamics is investigated. Trajectories in the pseudo phase plane, Poincare sections, bifurcation diagrams, the largest Lyapunov exponent, and the correlation dimension are considered. The Duffing-Ueda equation and four identified models are used. The purpose was to assess the real benefit of using such criteria as measures of the quality of the identified model. The results show that models with similar invariants may have very different bifurcation behaviors. The requirement that an identified model should reproduce the bifurcation pattern of the original system is a well suited criterion for validation purposes. ESA

CONTROLLING REGULAR AND CHAOTIC DYNAMICS IN THE DUFFING-UEDA OSCILLATOR
Luis A. Aguirre and S. A. Billings May 1993 34 p
(Grants CNPq-200597/90-6; SERC-GR/H-35286)
(RR-477; ETN-94-95143) Avail: CASI HC A03/MF A01

The control of the electrical oscillator which is modeled by the Duffing-Ueda equation is investigated. Two control schemes are suggested: the addition of an external weak force operating in a closed loop, and a model based control scheme. The first is concerned with suppressing chaos by means of adding an external weak force to the input driving oscillator. The second procedure uses a reference model to produce appropriate signals for the oscillator. It is shown that this control scheme is effective in regulating and in track problems. A procedure for determining the model of the system is discussed. A discrete model of the oscillator is used. A procedure for identifying models based on nonlinear autoregressive moving average model with exogenous inputs is indicated. ESA

ARBITRARY-ORDER NUMERICAL SCHEMES FOR LINEAR HYPERBOLIC SYSTEMS
Jian Shi Sep. 1992 21 p
(Cranfield-Aero-9211; ISBN-1-87-156449-2; ETN-94-95218) Avail: CASI HC A03/MF A01

An extension of the work carried out on arbitrary order numerical methods for model scalar hyperbolic equation is presented. These methods are extended to linear hyperbolic systems where waves can propagate in both directions. A generalized numerical formula which can accommodate arbitrary wave speeds for scalar advection equation is defined. In order to illustrate its application, three, four, and five point generalized numerical schemes are derived. According to the theory of linear systems, the generalized schemes are extended to linear hyperbolic systems in a straight forward manner. ESA

The thesis is an experimental survey of properties of rotating and stationary superfluid He-3. Two techniques, acoustics and optics, were used. Ultrasound, together with NMR, has provided most of the present experimental knowledge about the superfluid phases of He-3. The author applied acoustics for the first time to study rotating He-3. The main result was the discovery of a new vortex in (3)He-A when the magnetic field is low. New phenomena were observed in stationary He-3 as well. Most importantly, one of the collective modes, the real squashing (rsq) mode, of (3)He-B could be excited by means of two-phonon absorption. Superfluid He-3 was studied optically for the first time. No one has previously seen He-3 in the superfluid state. The principal achievement was developing techniques which facilitate optical experiments at temperatures below 1 mK, required to study superfluid He-3. Optical fibers were used to transmit light between room temperature and the cold parts of the cryostat. Before these investigations, photography had not been done below 10 mK. The usefulness of optics as a probe of the superfluid phases of He-3 was demonstrated by studying the macroscopic shape of the free surface of rotating (3)He-B. The classical parabolic meniscus was observed, which is indicative of the equilibrium density of vortices. NTIS

TRANSIENT ANALYSIS OF CONDUCTING HALF-PLANE PROBLEM WITH NONCAUSAL SCATTERING IMAGE
K. I. Nikoskinen, I. V. Lindell, and M. E. Ermutlu Apr. 1993 12 p See also PB92-190990 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-225027; ISBN-951-22-1524-1) Avail: Issuing Activity (National Technical Information Service (NTIS))

Two-dimensional transient scattering from a perfectly conducting half plane is studied. The excitation is an infinite impulsive line current parallel to edge of the conductor. Due to the symmetry of the problem, the electromagnetic field everywhere is TM along the direction defined by the edge. The analysis presented in the paper is based on new time-harmonic image solution found for the scattered field. The frequency-domain image current giving the reflected and diffracted fields is an exact function that can be expressed in terms of simple trigonometric functions. It is dependent only on the coordinates and the amplitude of the source, but interestingly, it is independent of frequency. Thus, the corresponding time-domain image is independent of time, which makes it noncausal. However, when integrating this image to compute the actual field, physical, and causal results are obtained. NTIS

SIMILARITY IN WAVE PROPAGATION UNDER A GLOBAL RELAXATION LAW
A. T. deHoop 1993 10 p Presented at the 2nd Conference on Mathematical and Numerical Aspects of Wave Propagation, Newark, DE, 7-10 Jun. 1993
(PB94-111028; ET/EM-1993-05) Copyright Avail: CASI HC A02/MF A01

The propagation of acoustic, electromagnetic, and elastodynamic waves in inhomogeneous media is usually, in the first instance, mathematically modeled under the assumption of negligible medium losses. In practice, however, often attenuation and dispersion in the wave phenomena are observed. These must be attributed to some unknown relaxation phenomenon. As a first try to model these phenomena, the use of a global relaxation law is suggested by which the time derivatives in the first-order coupled wave equations are replaced by a relaxation operator with a constant coefficient. Via the Schouten - Van der Pol theorem of the one-sided Laplace transformation with respect to time, the wave motion in such a medium can directly be expressed in terms of the one present in the medium's lossless counterpart (for which the relaxation coefficients have the value zero). The example for acoustic waves in a fluid is worked out in detail. NTIS

ANALYSIS OF TIME-DOMAIN ACOUSTIC WAVEFIELDS IN HORIZONTALLY CONTINUOUSLY LAYERED CONFIGURATIONS BASED ON THE MODIFIED CAGNIARD METHOD
M. D. Verweij and A. T. deHoop 1993 18 p
(PB94-111044; ET/EM-1993-06) Copyright Avail: CASI HC A03/MF A01

A combination of the Neumann series and the modified Cagniard method is used to derive a theoretically exact space-time domain solution for the 3-D acoustic wave propagation problem in horizontally continuously layered fluids. Firstly, integral transformations (among which a one-sided temporal Laplace transformation) are applied to the space-time domain basic acoustic equations. Secondly, a system of transform domain integral equations is derived, which is solved using a convergent Neumann series. Finally, the individual terms of this series are transformed back to the space-time domain using the modified Cagniard method. The space-time domain series turns out to be convergent for every continuously layered configuration and at any time instant. In contrast to the standard angular wave number-frequency domain analysis, in the present analysis difficulties due to turning points, etc., are avoided. It is noted that the method can be extended to deal with other kinds (elastodynamic or electromagnetic) of waves. NTIS

A MODELLING OF THE NOISE FROM SIMPLE CO-AXIAL JETS. PART 2: IN A SIMULATED FLIGHTSTREAM
M. J. Fisher and G. A. Preston Nov. 1993 41 p
(ISVR-TR-226) Copyright Avail: Issuing Activity

This report forms part of a continuing study of co-axial jet noise, and describes the work undertaken to predict the noise emitted by a cold, co-axial, co-planar jet within a flow to simulate flight. Three sound producing regions, identified in a previous report, appear to behave in flight exactly as a single jet does, with sound levels reduced over the whole spectrum by an amount proportional to the relative velocity ratio; the sum of the three corrected spectra predicts the co-axial jet spectrum to a useful degree of accuracy. CLASSICAL SCATTERING THEORY OF WAVES FROM THE VIEW POINT OF AN EIGENVALUE PROBLEM AND APPLICATION TO TARGET IDENTIFICATION
C. Bottcher, M. R. Strayer, and M. F. Werby (Naval Research Lab., Bay Saint Louis, MS.) 1993 9 p Presented at the SPIE OE/Aerospace Science and Sensing Meeting, Orlando, FL, 11-16 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE94-000472; CONF-930445-26) Avail: CASI HC A02/MF A01

The Helmholtz-Poincare Wave Equation (H-PWE) arises in many areas of classical wave scattering theory. In particular it can be found for the cases of acoustical scattering from submerged bounded objects and electromagnetic scattering from objects. The extended boundary integral equations (EBIE) method is derived from considering both the exterior and interior solutions of the H-PWE's. This coupled set of expressions has the advantage of not only offering a prescription for obtaining a solution for the exterior scattering problem, but it also obviates the problem of irregular values corresponding to fictitious interior eigenvalues. Once the coupled equations are derived, they can by obtained in matrix form by expanding all relevant terms in partial wave expansions, including a biorthogonal expansion of the Green function. However some freedom of choice in the choice of the surface expansion is available since the unknown surface quantities may be expanded in a variety of ways as long as closure is obtained. Out of many possible choices, we develop an optimal method to obtain such expansions which is based on the optimum eigenfunctions related to the surface of the object. In effect, we convert part of the problem (that associated with the Fredholms integral equation of the first kind) an eigenvalue problem of a related Hermition operator. The methodology will be explained in detail and examples will be presented. DOE

Int-Patent-Class-H04R-5/00) Avail: US Patent and Trademark Office

An apparatus for producing pseudo-stereophonic sound from a monaural signal is discussed. The apparatus includes a monaural source that has a speaker placed in an anechoic room and has a sound output generated by the monaural signal. The second, third, fourth, and fifth speakers are placed in the anechoic room symmetrically about a listener. The monaural signal from the source is processed to output processed signals to each of the second, third, fourth, and fifth speakers, each speaker producing a sound output corresponding to the received processed signal. A pair of microphones is placed in the ears of the listener for receiving the sound outputs of the first, second, third, fourth, and fifth speakers and producing two differentiated audio channels.

REFRACTION OF HIGH FREQUENCY NOISE IN AN ARBITRARY JET FLOW
Abbas Khavaran (Sverdrup Technology, Inc., Brook Park, OH.) and Eugene A. Krejsa Jan. 1994 19 p Presented at the 32nd Aerospace Sciences Meeting and Exhibit, Reno, NV, 10-13 Jan. 1994; sponsored by AIAA
(Contract NAS3-25266; RTOP 537-02-23)
(NASA-TM-106465; E-8330; NAS 1.15:106465; AIAA Paper 94-0139)
Avail: CASI HC A03/MF A01

Refraction of high frequency noise by mean flow gradients in a jet is studied using the ray-tracing methods of geometrical acoustics. Both the two-dimensional (2D) and three-dimensional (3D) formulations are considered. In the former case, the mean flow is assumed parallel and the governing propagation equations are described by a system of four first order ordinary differential equations. The 3D formulation, on the other hand, accounts for the jet spreading as well as the axial flow development. In this case, a system of six first order differential equations are solved to trace a ray from its source location to an observer in the far field. For subsonic jets with a small spreading angle both methods lead to similar results outside the zone of silence. However, with increasing jet speed the two prediction models diverge to the point where the parallel flow assumption is no longer justified. The Doppler factor of supersonic jets as influenced by the refraction effects is discussed and compared with the conventional modified Doppler factor. Author (revised)

ADAPTIVE NONLINEAR POLYNOMIAL NEURAL NETWORKS FOR CONTROL OF BOUNDARY LAYER/STRUCTURAL INTERACTION Final Report, 16 Jan. - 15 Aug. 1991
B. Eugene Parker, Jr., Richard L. Cellucci, Dean W. Abbott, Roger L. Barron, Paul R. Jordan, III, and H. Vincent Poor (Princeton Univ., NJ.) Dec. 1993 70 p
(Contract NAS1-19271; RTOP 324-01-00; SBIR-02.10-4400)
(NASA-CR-189645; NAS 1.26:189645) Avail: CASI HC A04/MF A01

The acoustic pressures developed in a boundary layer can interact with an aircraft panel to induce significant vibration in the panel. Such vibration is undesirable due to the aerodynamic drag and structure-borne cabin noises that result. The overall objective of this work is to develop effective and practical feedback control strategies for actively reducing this flow-induced structural vibration. This report describes the results of initial evaluations using polynomial, neural network-based, feedback control to reduce flow induced vibration in aircraft panels due to turbulent boundary layer/structural interaction. Computer simulations are used to develop and analyze feedback control strategies to reduce vibration in a beam as a first step. The key differences between this work and that going on elsewhere are as follows: that turbulent and transitional boundary layers represent broadband excitation and thus present a more complex stochastic control scenario than that of narrow band (e.g., laminar boundary layer) excitation; and secondly, that the proposed controller structures are adaptive nonlinear infinite impulse response (IIR) polynomial neural network, as opposed to the traditional adaptive linear finite impulse response (FIR) filters used in most studies to date. The controllers implemented in this study achieved vibration attenuation of 27 to 60 dB depending on the type of boundary layer established by laminar, turbulent, and intermittent laminar-to-turbulent transitional flows. Application of multi-input, multi-output, adaptive, nonlinear feedback control of vibration in aircraft panels based on polynomial neural networks appears to be feasible today. Plans are outlined for Phase 2 of this study, which will include extending the theoretical investigation conducted in Phase 2 and verifying the results in a series of laboratory experiments involving both bum and plate models. CHEMICALLY SENSITIVE INTERFACES ON SAW DEVICES

A. J. Ricco, S. J. Martin, R. M. Crooks (Texas A&M Univ., College Station.), Chuanjing Xu (Texas A&M Univ., College Station.), and R. E. Allred (Adherent Technologies, Albuquerque, NM.) 1993 17 p Presented at the 206th American Chemical Society (ACS) National Meeting, Chicago, IL, 22-27 Aug. 1993

(Contract DE-AC04-94AL-85000)

(DE94-001832; SAND-93-2265C; CONF-930802-16) Avail: CASI HC A03/MF A01

Using surface acoustic wave (SAW) devices, three approaches to the effective use of chemically sensitive interfaces that are not highly chemically selective have been examined: molecular identification from time-resolved permeation transients; using multifrequency SAW devices to determine the frequency dependence of analyte/film interactions; and use of an array of SAW devices bearing diverse chemically sensitive interfaces to produce a distinct response pattern for each analyte. In addition to their well-known sensitivity to mass changes (0.0035 monolayer of N2 can be measured), SAW devices respond to the mechanical and electronic properties of thin films, enhancing response information content but making a thorough understanding of the perturbation critical. Simultaneous measurement of changes in frequency and attenuation, which can provide the information necessary to determine the type of perturbation, are used as part of the above discrimination schemes. DIFFRACTION ANALYSIS OF TRANSIENT ACOUSTIC WAVES: HALF-PLANE IN A LAYERED MEDIUM

K. F. I. Haak 1993 185 p

(PB94-110988; ET/EM-1993-15) Copyright Avail: CASI HC A09/MF A02

In marine seismics, acoustic waves serve as standard diagnostic tools to probe the earth geology below the sea bottom. Some processing methods in marine seismics result from a proper application of the theorem of reciprocity. In this theorem, the actual field quantities to be probed interact with the computational quantities of a probing state in such a processing method. The configuration consists of a fluid layer with a semi-infinite pressure-free screen in it. A homogeneous half-space models the subsurface of the sea floor. The transient wave problem is then solved by means of an iterative scheme in which successive application of the Wiener-Hopf technique and the Cagniard-De Hoop method is used. From the numerical results it turns out that only the first and second order diffracted wave field give a significant contribution to the geometrical wave field. Application of these results in the iterative scheme yields a very effective solution scheme in which the transient wave field in the configuration at hand can be calculated within any finite time window. VARIABILITY OF MEASURED SONIC BOOM SIGNATURES. VOLUME 1: TECHNICAL REPORT Final Report

K. R. Elmer and M. C. Joshi Jan. 1994 43 p

(Contract NAS1-19060; RTOP 537-03-21-03)

(NASA-CR-191483-Vol-1; NAS 1.26:191483-Vol-1) Avail: CASI HC A03/MF A01

Sonic boom signatures from two databases, the BOOMFILE and the XB-70, were analyzed in terms of C-weighted sound exposure level (CSEL), A-weighted sound exposure level (ASEL), and Stevens Mark VII perceived level (PLdB), as well as the more traditional peak positive overpressure and rise time. The variability of these parameters due to propagation through atmosphere was analyzed for different aircraft Mach number and altitude groups. The low Mach number/low altitude group had significantly greater variation in rise time, overpressure, and loudness level than the high Mach number/high altitude group. The loudness of measured booms were found to have a variation of up to 25 dB relative to the loudness of boom predicted for a non-turbulent atmosphere. This is due primarily to the steeper ray paths of the high Mach number/high altitude group and the corresponding shorter distances traveled by these rays through the lower atmosphere resulting in reduced refraction effects. The general trend of decreased overpressure and loudness level with increasing lateral distance was also seen. Sonic boom signatures from early morning flights had less variation in rise time and overpressure than afternoon flights because of reduced turbulence. Measures of asymmetry (difference between compression and expansion portion of the signature) showed that the variability in Delta loudness level was greater than the variability in Delta overpressure due to the large influence of turbulence on rise time. Lastly, analysis of data within 50 percent of lateral cutoff showed that the mean value for overpressure and loudness level was independent of time of day but that the frequency with which it occurred was greater in the morning. This is a clear indicator of increased turbulence in the afternoon. Author (revised)

JOINT ACOUSTIC PROPAGATION EXPERIMENT (JAPE-91) WORKSHOP

William L. Willshire, Jr., comp. and David Chestnutt, comp. Dec. 1993 190 p Workshop held in Hampton, VA, 28 Apr. 1993 Sponsored in

part by Univ. of Mississippi, Oxford
(RTOP 505-63-70-02)
(NASA-CP-3231; L-17331; NAS 1.55:3231) Avail: CASI HC A09/MF A02

The Joint Acoustic Propagation Experiment (JAPE), was conducted at the White Sands Missile Range, New Mexico, USA, during the period 11-28 Jul. 1991. JAPE consisted of various short and long range propagation experiments using various acoustic sources including speakers, propane cannons, helicopters, a 155 mm howitzer, and static high explosives. Of primary importance to the performance of theses tests was the extensive characterization of the atmosphere during these tests. This atmospheric characterization included turbulence measurements. A workshop to disseminate the results of JAPE-91 was held in Hampton, VA, on 28 Apr. 1993. This report is a compilation of the presentations made at the workshop along with a list of attendees and the agenda. For individual titles, see N94-24208 through N94-24222.

JOINT ACOUSTIC PROPAGATION EXPERIMENT (JAPE)

Benny L. Carnes, Robert O. Olsen (Army Research Lab., White Sands Missle Range, NM.), and Bruce W. Kennedy (New Mexico State Univ., Las Cruces.) *In* NASA. Langley Research Center, Joint Acoustic Propagation Experiment (JAPE-91) Workshop Dec. 1993 p 1-17 (For primary document see N94-24207 06-71)
Avail: CASI HC A03/MF A02

The Joint Acoustic Propagation Experiment (JAPE), performed under the auspices of NATO and the Acoustics Working Group, was conducted at White Sands Missile Range, New Mexico, USA, during the period 11-28 Jul. 1991. JAPE consisted of 220 trials using various acoustic sources including speakers, propane cannon, various types of military vehicles, helicopters, a 155mm howitzer, and static high explosives. Of primary importance to the performance of these tests was the intensive characterization of the atmosphere before and during the trials. Because of the wide range of interests on the part of the participants, JAPE was organized in such a manner to provide a broad cross section of test configurations. These included short and long range propagation from fixed and moving vehicles, terrain masking, and vehicle detection. A number of independent trials were also performed by individual participating agencies using the assets available during JAPE. These tests, while not documented in this report, provided substantial and important data to those groups. Perhaps the most significant feature of JAPE is the establishment of a permanent data base which can be used by not only the participants but by others interested in acoustics. A follow-on test was performed by NASA LaRC during the period 19-29 Aug. 1991 at the same location. These trials consisted of 59 overflights of supersonic aircraft in order to establish the relationship between atmospheric turbulence and the received sonic boom energy at the surface. INTERCOMPARISON OF REMOTE AND BALLOON-BORNE SENSORS OPERATED AT JAPE-91

Richard J. Okrasinski, Greg J. Cook, and Robert O. Olsen (Army Research Lab., White Sands Missle Range, NM.) *In* NASA. Langley Research Center, Joint Acoustic Propagation Experiment (JAPE-91) Workshop Dec. 1993 p 31-39 (For primary document see N94-24207 06-71)
Avail: CASI HC A02/MF A02

In recent years, there has been an increased availability of different types of remote sensors for measuring atmospheric parameters. With the introduction of remote sensors into field operation, questions have arisen as to their accuracy and precision. An attempt was made to address this issue by analyzing and intercomparing sets of wind and temperature data obtained during the Joint Acoustic Propagation Experiment (JAPE-9l) conducted at White Sands Missile Range, New Mexico, in Jul. and Aug. 1991. The remote sensing systems that were deployed included a 924 MHz wind profiler, two Doppler acoustic sodars, and a Radio Acoustic Sounding System (RASS). In situ measurements of wind, temperature, and humidity were also obtained from radiosondes. Individual system characteristics and the results of intercomparing the derived wind and temperature data from each of the systems are presented. Author (revised)

EFFECTS OF ATMOSPHERIC VARIATIONS ON ACOUSTIC SYSTEM PERFORMANCE

Robert Nation, Stephen Lang, Robert Olsen (Army Research Lab., White Sands Missle Range, NM.), and Prasan Chintawongvanich (New Mexico State Univ., Las Cruces.) *In* NASA. Langley Research Center, Joint Acoustic Propagation Experiment (JAPE-91) Workshop Dec. 1993 p 41-53 (For primary document see N94-24207 06-71)
Avail: CASI HC A03/MF A02

Acoustic propagation over medium to long ranges in the atmosphere is subject to many complex, interacting effects. Of particular interest at this point is modeling low frequency (less than 500 Hz) propagation for the purpose of predicting ranges and bearing accuracies at which acoustic sources can be detected. A simple means of estimating how much of the received signal power propagated directly from the source to the receiver and how much was received by turbulent scattering was developed. The correlations between the propagation mechanism and detection thresholds, beamformer bearing estimation accuracies, and beamformer processing gain of passive acoustic signal detection systems were explored. Author (revised)

COMPARISON OF MEASURED AND PREDICTED PURE TONE PROPAGATION LEVELS FROM JAPE-1: AN EVALUATION OF THE PERFORMANCE OF ASOPRAT

Carl K. Frederickson, Henry E. Bass, Richard Raspet, and John Messer *In* NASA. Langley Research Center, Joint Acoustic Propagation Experiment (JAPE-91) Workshop Dec. 1993 p 55-64 (For primary document see N94-24207 06-71)
Avail: CASI HC A02/MF A02

Joint Acoustic Propagation Experiment Phase One (JAPE-1) short range propagation data has been used to evaluate the performance of the Advanced Sound Propagation in the Atmosphere (ASOPRAT) prediction code. The pure tone short range data was Fourier analyzed giving the propagated pressure levels as a function of frequency. Meteorological profiles measured at the experimental site were used as input for the acoustic prediction routine ASOPRAT. Predicted and measured propagation levels are compared in decibels (dB) relative to one of the measurement positions for receivers on the line passing between the two thirty meter towers. Agreement between predicted and measured levels is very good. Source strength data was not available, hence the comparisons show good agreement as to the shape of the propagation loss curve not necessarily the propagation levels. Author (revised)

JAPE 91: INFLUENCE OF TERRAIN MASKING OF THE ACOUSTIC PROPAGATION OF HELICOPTER NOISE

P. Naz *In* NASA. Langley Research Center, Joint Acoustic Propagation Experiment (JAPE-91) Workshop Dec. 1993 p 79-85 Sponsored in part by Direction de Reserches Etudes et Techniques, Paris, France (For primary document see N94-24207 06-71)

Avail: CASI HC A02/MF A02

The acoustic propagation in the case of a noise source masked by a small element of terrain has been investigated experimentally. These data have been measured during the 'terrain masking' experiment of the NATO JAPE 91 experimental campaign. The main objective of that experiment was to study the acoustic detection of a helicopter masked by a small hill. Microphones have been placed at different locations on the shadow zone of the hill to study the effect of the terrain obstruction on sound propagation. The results presented come from data measured by Atlas Elektronik and by ISL, and have been processed together. The terrain obstruction causes an excess attenuation of the SPL (Sound Pressure Level) for all the frequencies, but this attenuation is more effective for the high frequencies than for the low frequencies. Results typical of diffraction phenomena have been observed; the SPL is minimal at the foot of the hill and is relatively constant beyond it. Author

COMPARISONS OF CALCULATED AND MEASURED HELICOPTER NOISE NEAR INSTRUMENT HILL

Henry E. Bass and Chulsoo You *In* NASA. Langley Research Center, Joint Acoustic Propagation Experiment (JAPE-91) Workshop Dec. 1993 p 87-92 (For primary document see N94-24207 06-71)

Avail: CASI HC A02/MF A02

The polar parabolic equation (POPE) method solves for the diffraction of sound by a curved surface including a realistic sound speed profile. POPE is outlined briefly to describe diffraction which propagates the field over a hill. Experimental data are compared with POPE predictions using the measured sound speed profile and ground impedance. Two trial cases are considered for the comparisons: the helicopter located at the base of the hill and far away from the base of the hill, respectively. The physical mechanisms for sound propagation over a hill are examined with and of POPE calculations and experimental data. The shedding of rays from the hillside gives an interference effect with a wave along the flat surface beyond the base of a hill. Author

PRELIMINARY ANALYSIS OF AMPLITUDE AND PHASE FLUCTUATIONS IN THE JAPE MULTIPLE TONE DATA TO DISTANCES OF 500 METERS

James Rogers, Radomir Sokolov, Daniel Hicks (Army Tank-Automotive Research and Development Command, Warren, MI.), and Lloyd Cartwright (Army Tank-Automotive Research and Development Command, Warren, MI.) *In* NASA. Langley Research Center, Joint Acoustic Propagation Experiment (JAPE-91) Workshop Dec. 1993 p 93-106 (For primary document see N94-24207 06-71)

Avail: CASI HC A03/MF A02

The JAPE short range data provide a good opportunity for studying phase and amplitude fluctuations of acoustic signals in the atmosphere over distances of several hundred meters. Several factors contribute to the usefulness of these data: extensive meteorological measurements were made, controlled sources were used, the data were recorded with a high dynamic range digital system that preserved phase information and a significant number of measurement points were obtained allowing both longitudinal and transverse studies. Further, Michigan Tech, in cooperation with the U.S. Army TARDEC, has developed phase tracking algorithms for studying vehicle acoustic signals. These techniques provide an excellent tool for analyzing the amplitude and phase fluctuations of the JAPE data. The results of studies such as those reported here have application at several levels: the mechanisms of signal amplitude and phase fluctuations in propagating acoustic signals are not well understood nor are the mathematical models highly developed, acoustic arrays depend strongly on signal coherence and signal amplitude stability in order to perform to their design specifications and active noise control implementation in regions considerably removed from the primary and secondary sources depends upon signal amplitude and phase stability. Work reported here is preliminary in nature but it does indicate the utility of the phase tracking and amplitude detection algorithms. The results obtained indicate that the phase fluctuations of the JAPE continuous multiple tone data (simultaneous transmission of 80, 200 and 500 Hz) are in general agreement with existing theories but the amplitude fluctuations are seen to be less well behaved and show less consistency. DIMENSIONAL ANALYSIS OF ACOUSTICALLY PROPAGATED SIGNALS

Scott D. Hansen and Dennis W. Thomson *In* NASA. Langley Research Center, Joint Acoustic Propagation Experiment (JAPE-91) Workshop Dec. 1993 p 107-11 (For primary document see N94-24207 06-71)

Avail: CASI HC A03/MF A02

Traditionally, long term measurements of atmospherically propagated sound signals have consisted of time series of multiminute averages. Only recently have continuous measurements with temporal resolution corresponding to turbulent time scales been available. With modern digital data acquisition systems we now have the capability to simultaneously record both acoustical and meteorological parameters with sufficient temporal resolution to allow us to examine in detail relationships between fluctuating sound and the meteorological variables, particularly wind and temperature, which locally determine the acoustic refractive index. The atmospheric acoustic propagation medium can be treated as a nonlinear dynamical system, a kind of signal processor whose innards depend on thermodynamic and turbulent processes in the atmosphere. The atmosphere is an inherently nonlinear dynamical system. In fact one simple model of atmospheric convection, the Lorenz system, may well be the most widely studied of all dynamical systems. In this paper we report some results of our having applied methods used to characterize nonlinear dynamical systems to study the characteristics of acoustical signals propagated through the atmosphere. For example, we investigate whether or not it is possible to parameterize signal fluctuations in terms of fractal dimensions. For time series one such parameter is the limit capacity dimension. Nicolis and Nicolis were among the first to use the kind of methods we have to study the properties of low dimension global attractors. Derived from text

COMPARISON BETWEEN 1-MINUTE AND 15-MINUTE AVERAGES OF TURBULENCE PARAMETERS

John M. Noble *In* NASA. Langley Research Center, Joint Acoustic Propagation Experiment (JAPE-91) Workshop Dec. 1993 p 119-12 (For primary document see N94-24207 06-71)

Avail: CASI HC A02/MF A02

Sonic anemometers are good instruments for measuring temperature and wind speed and are fast enough to calculate the temperature and wind structure parameters used to calculate the variance in the acoustic index of refraction. However, the turbulence parameters are typically 15-minute averaged point measurements. There are several problems associated with making point measurements and using them to represent a turbulence field. Some of the sonic anemometer data analyzed from the Joint Acoustic Propagation Experiment (JAPE) conducted during July 1991 at DIRT Site located at White Sands Missile Range, New Mexico, are examined. BEAMFORMING IN AN ACOUSTIC SHADOW Abstract Only

David Havelock, Michael Stinson, and Gilles Daigle *In* NASA. Langley Research Center, Joint Acoustic Propagation Experiment (JAPE-91) Workshop Dec. 1993 p 129 (For primary document see N94-24207 06-71)

Avail: CASI HC A01/MF A02

The sound field deep within an acoustic shadow region is less well understood than that outside the shadow region. Signal levels are substantially lower within the shadow, but beamforming difficulties arise for other reasons such as loss of spatial coherence. Based on analysis of JAPE-91 data, and other data, three types of characteristic signals within acoustic shadow regions are identified. These signal types may correspond to different, intermittent signal propagation conditions. Detection and classification algorithms might take advantage of the signal characteristics. Frequency coherence is also discussed. The extent of coherence across frequencies is shown to be limited, causing difficulties for source classification based on harmonic amplitude relationships. Discussions emphasize short-term characteristics on the order of one second. A video presentation on frequency coherence shows the similarity, in the presence of atmospheric turbulence, between the received signal from a stable set of harmonics generated by a loudspeaker and that received from a helicopter hovering behind a hill. ANALYSIS OF PASSIVE ACOUSTIC RANGING OF HELICOPTERS FROM THE JOINT ACOUSTIC PROPAGATION EXPERIMENT

Benny L. Carnes and John C. Morgan *In* NASA. Langley Research Center, Joint Acoustic Propagation Experiment (JAPE-91) Workshop Dec. 1993 p 131-17 (For primary document see N94-24207 06-71)
Avail: CASI HC A03/MF A02

For more than twenty years, personnel of the U.S.A.E. Waterways Experiment Station (WES) have been performing research dealing with the application of sensors for detection of military targets. The WES research has included the use of seismic, acoustic, magnetic, and other sensors to detect, track, and classify military ground targets. Most of the WES research has been oriented toward the employment of such sensors in a passive mode. Techniques for passive detection are of particular interest in the Army because of the advantages over active detection. Passive detection methods are not susceptible to interception, detection, jamming, or location of the source by the threat. A decided advantage for using acoustic and seismic sensors for detection in tactical situations is the non-line-of-sight capability; i.e., detection of low flying helicopters at long distances without visual contact. This study was conducted to analyze the passive acoustic ranging (PAR) concept using a more extensive data set from the Joint Acoustic Propagation Experiment (JAPE). Author (revised)

(Contract DLA900-86-C-0022)
Avail: CASI HC A02/MF A02

A neural network approach to the classification of acoustic emissions of ground vehicles and helicopters is demonstrated. Data collected during the Joint Acoustic Propagation Experiment conducted in July of l991 at White Sands Missile Range, New Mexico was used to train a classifier to distinguish between the spectrums of a UH-1, M60, M1 and M114. An output node was also included that would recognize background (i.e. no target) data. Analysis revealed specific hidden nodes responding to the features input into the classifier. Initial results using the neural network were encouraging with high correct identification rates accompanied by high levels of confidence. Author (revised)

Remotely sensing and classifying military vehicles in a battlefield environment have been the source of much research over the past 20 years. The ability to know where threat vehicles are located is an obvious advantage to military personnel. In the past active methods of ground vehicle detection such as radar have been used, but with the advancement of technology to locate these active sensors, passive sensors are preferred. Passive sensors detect acoustic emissions, seismic movement, electromagnetic radiation, etc., produced by the target and use this information to describe it. Deriving the mathematical models to classify vehicles in this manner has been, and is, quite complex and not always reliable. However, with the resurgence of artificial neural network (ANN) research in the past few years, developing models for this work may be a thing of the past. Preliminary results from an ANN analysis to the tank signatures recorded at the Joint Acoustic Propagation Experiment (JAPE) at the US Army White Sands Missile Range, NM, in July 1991, are presented. UNSTRUCTURED ADAPTIVE MESH COMPUTATIONS OF ROTORCRAFT HIGH-SPEED IMPULSIVE NOISE

Roger Strawn (Army Aviation Systems Command, Moffett Field, CA.), Michael Garceau (Stanford Univ., CA.), and Rupak Biswas Oct. 1993 13 p Presented at the AIAA 15th Aeroacoustics Conference, Long Beach, CA, 25-27 Oct. 1993
(Contract NAS2-13721)
(NASA-CR-195090; NAS 1.26:195090; RIACS-TR-93-10; AIAA Paper 93-4359) Avail: CASI HC A03/MF A01

A new method is developed for modeling helicopter high-speed impulsive (HSI) noise. The aerodynamics and acoustics near the rotor blade tip are computed by solving the Euler equations on an unstructured grid. A stationary Kirchhoff surface integral is then used to propagate these acoustic signals to the far field. The near-field Euler solver uses a solution-adaptive grid scheme to improve the resolution of the acoustic signal. Grid points are locally added and/or deleted from the mesh at each adaptive step. An important part of this procedure is the choice of an appropriate error indicator. The error indicator is computed from the flow field solution and determines the regions for mesh coarsening and refinement. Computed results for HSI noise compare favorably with experimental data for three different hovering rotor cases. Author (revised)

VALIDATION OF THE ROTAC CODE FOR THE ROTOR NOISE PREDICTION

P. Gnemmi, J. Haertig, and C. Johe 1992 18 p See also PB93-204303 Sponsored by Direction des Recherches, Etudes et Techniques and Centre de Documentation de l'Armement Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-204311; ISL-CO-228/92) Avail: CASI HC A03

The blade/vortex interaction noise and the thickness noise are the impulsive noises radiated by a helicopter rotor flying at low speed. A prediction code of the thickness and loading noises applied to a helicopter rotor has been developed at ISL. This code, named ROTAC, is very briefly described here. In order to validate this acoustic code, calculations are compared with measurements obtained by ISL and by a DLR US-ARMY collaboration. The thickness noise of a rotor in hover and forward flight is correctly predicted up to a tip Mach number near 0.88. For a flight configuration with occurrence of blade/vortex interaction, the small number of blade pressure measurements does not allow the determination of the amplitude of the loading noise but these entry data make it possible to examine qualitatively the agreement between calculations and measurements. For a number of years the National Physical Laboratory, supported by the Ministry of Defense, has been developing AIRNOISE, a mathematical model for computing aircraft noise contours. The model is now being extended to include helicopter operations. In order to provide basic source noise data for the model, a special noise trial - Exercise Keevil - has been conducted at RAF Keevil in Wiltshire. One helicopter of each of six types performed a variety of flight operations over an array of microphones. Information on aircraft position and speed were obtained by video tracking techniques. The report describes the trial and presents the results obtained. NTIS

A study was performed to characterize short-range, low-frequency acoustic propagation at the Arraial do Cabo acoustic range, which is located in shallow water on the Southeast coast of Brazil. Acoustic transmission data, obtained by using multitone continuous-wave (CW) transmissions from uncalibrated sound sources and omnidirectional receivers were compared with predictions of normal-mode acoustic transmission models. The measurements, which were made along the 17- and 47-m isobaths, extended over the frequency range from 12 to 375 Hz. It was found that, for most of the data, short-range multipath interference patterns were in agreement with results calculated by modeling the ocean bottom as a fluid. At frequencies below 80 Hz, the influence of shear waves in the ocean bottom was found to be important for the data taken in water depth 17 m. Recommendations are made to help guide follow-on modeling and experimental acoustic propagation studies. DTIC

FAN NOISE RESEARCH AT NASA
John F. Groeneweg Feb. 1994 12 p Proposed for presentation at the 1994 National Conference on Noise Control Engineering, Fort Lauderdale, FL, 1-4 May 1994; sponsored by the Institute of Noise Control Engineering
(RTOP 538-03-11)
(NASA-TM-106512; E-8623; NAS 1.15:106512) Avail: CASI HC A03/MF A01

Results of recent NASA research to reduce aircraft turbofan noise are described. As the bypass ratio of a turbofan engine increases from five to as much as 20, the dominant source of engine noise is the fan. A primary mechanism of tone noise generation is the rotor blade wakes interacting with downstream stator vanes. Methods of analyzing rotor stator tone noise generation are described and sample results are given. The role of an acoustic modal description is emphasized. Wind tunnel tests of model fans and nacelles are described including a novel rotating microphone technique for modal measurement. Sample far field results are given showing the effects of inlet length, and modal measurements are shown which point to a new generation mechanism. Concepts for active fan noise control at the source are addressed. Implications of the research which have general relevance to fan noise generation and control are discussed. Author (revised)

THE EFFECTS OF PROFILES ON SUPERSONIC JET NOISE Progress Report, period ending 31 Jan. 1994
S. N. Tiwari and T. R. S. Bhat Feb. 1994 39 p
(Grant NAG1-1581)
(NASA-CR-195184; NAS 1.26:195184) Avail: CASI HC A03/MF A01

The effect of velocity profiles on supersonic jet noise are studied by using stability calculations made for a shock-free coannular jet, with both the inner and outer flows supersonic. The Mach wave emission process is modeled as the noise generated by the large scale turbulent structures or the instability waves in the mixing region. Both the vortex-sheet and the realistic finite thickness shear layer models are considered. The stability calculations were performed for both inverted and normal velocity profiles. Comparisons are made with the results for an equivalent single jet, based on equal thrust, mass flow rate and exit area to that of the coannular jet. The advantages and disadvantages of these velocity profiles as far as noise radiation is concerned are discussed. It is shown that the Rayleigh's model prediction of the merits and demerits of different velocity profiles are in good agreement with the experimental data. Author (revised)

SOME SUBJECTS IN DIGITAL AUDIO, NOISE SHAPING, SAMPLE RATE CONVERSION, DYNAMIC RANGE COMPRESSION AND TESTING Ph.D. Thesis
Eduard Ferdinand Stikvoort 1992 247 p Prepared in cooperation with Philips Gloeilampenfabrieken N.V., Eindhoven, Netherlands
(ISBN-9-09-005162-7; ETN-94-95321) Copyright Avail: CASI HC A11/MF A03

The following subjects in the field of digital audio are presented: digital sample rate conversion between nonrelated rates, digital noise shaping code conversion, distortion analysis, and dynamic range compression. The sample rate conversion of digital audio signals between nonrelated frequencies concerns the conversion between, for example, 48 kHz and 44.1 kHz and conversion between nominally equal sample frequencies which are derived from different master clocks. The one bit coding of a digital signal is used. The results of quantization and quantizing noise taken from the literature are discussed. The digital distortion analyzer which is used for testing of A/D converters or the signal processing is presented. The tuning mechanism of the notch filter and the corresponding frequency detection which was found is described. The implementation and performance of the distortion analyzer are given. The dynamic range compression is realized by multiplying the left and right hand audio signals with a gain control signal. The realized compression aims at minimizing artifacts and distortion and the compression ratio is made constant over the entire input range of the compressor. The hardware, based on modular set up and used for implementation of real time digital audio processing, is described. ESA

ON THE AUDITORY DISCRIMINATION OF SPECTRAL SHAPE Ph.D. Thesis
Nicolaus Jacobus Versfeld 1992 149 p Sponsored by Netherlands Organization for the Advancement of Scientific Research
(ETN-94-95306) Avail: CASI HC A07/MF A02

The ability of the human auditory system to discriminate between very simple sounds is investigated. The simplest sounds that still may comprise a change in the spectral shape are considered. The experiments are not restricted to signals with bandwidths that exceed the critical bandwidth. Both within channel and across channel comparison is studied. Experiments with multitone complexes are performed. By variation of the number of components and the component spacing, an attempt to gain some insight into the important factors influencing spectral shape discrimination is made. The results show that two tone complexes of which the amplitudes are changed in opposite direction are interesting signals in the light of profile analysis. Thresholds for changes in the amplitudes are measured systematically as a function of signal parameters such as frequency separation, center frequency, and overall intensity. The results are used to evaluate some models on spectral shape discrimination. The discriminability of a change in the sign of the spectral slope of a noise band is examined. The results give some insight into the discrimination processes with noise-like signals. They are used to relate discrimination of signals with continuous spectra to those with discrete spectra. ESA

LIMITS ON HIGH-ORDER HARMONIC GENERATION FROM SINGLE-ATOM CALCULATIONS
K. C. Kulander and K. J. Schafer 18 Aug. 1993 7 p Presented at the 6th International Conference on Multiphoton Processes, Quebec City, Quebec, 25-30 Jun. 1993
(Contract W-7405-eng-48)
(DE93-019950; UCRL-JC-114857; CONF-9306125-4) Avail: CASI HC A02/MF A01

In the quantum mechanical calculations of electron and photon emission from atoms in strong laser fields, a single-active-electron (SAE) model was employed. The effect of the time varying electric field of the laser on each of the valence electrons separately was determined. The active electron in each calculation moves in the time-independent mean field of the remaining, unexcited electrons and the nucleus. This approach works well for the rare gas atoms, at least partially because the neglected double or higher excitations involve states well above the ionization threshold. The photoelectron and photon emission spectra calculated using this technique agree quantitatively with observed emission rates. A simple semiclassical model for high intensity ionization which reproduces the observed harmonic emission spectra obtained in this regime and which provides considerable insight into the dynamics of this process is presented. The basic models was used in the past to predict electron energy distributions in the tunneling regime and it will be used for harmonics. DOE

THE STATUS OF GLUEBALLS
S. J. Lindenbaum 14 Apr. 1993 7 p Presented at the Future Directions in Particle and Nuclear Physics at Multi-GeV Hadron Beam Facilities, Upton, NY, 4-6 Mar. 1993 Prepared in cooperation with City Coll. of the City Univ. of New York, NY
(Contract DE-AC02-76CH-00016)
(DE93-040040; BNL-49416; CONF-930389-22) Avail: CASI HC A02/MF A01

The Status of Glueballs is presented considering them the most popular candidates from among the isoscalars in the J(sup PC) = 0(exp ++), 0(exp -+) and 2(exp ++) channels. It is shown that in the 0(exp ++) channel the f(sub 0)(1720) which was discovered earlier (the S*(prime)(1720)) at BNL is highly likely the same state as the SLAC (theta)(1720) now that its spin has been found to be 0 instead of the 2 claimed for a long period. In the 0(exp ++) channel there is likely a complex of 2-3 states zeta/eta(1280), lambda/eta(1420) and iota/eta(1520) involving at least one extra isoscalar. In the 2(exp ++), the g(sub T)(2010), g(sub T)(prime)(2300) and g(sub T)(double prime)(2340) (phi)(phi) states found in pi(exp (minus)) p yields (phi)(phi)n (OZI forbidden glueball filter channel) strikingly, approximately, completely break the OZI suppression and comprise within the errors all the (phi)(phi) cross-section. The only viable explanation of these states in the context of QCD is that they are produced by 1-3 primary 2(exp ++) glueballs. All alternate explanations in the past 15 years have failed. DOE

PIONS AND NEUTRINOS AS PROBES OF THE NUCLEON AND NUCLEAR FEW-BODY SYSTEM
C. M. Hoffman 1993 9 p Presented at the 14th European Conference on Few-Body Problems in Physics, Amsterdam, Netherlands, 22-27 Aug. 1993
(Contract W-7405-eng-36)
(DE93-040127; LA-UR-93-3006; CONF-9308164-1) Avail: CASI HC A02/MF A01

A number of studies of few-body nucleon and nuclear systems are being pursued at LAMPF using pions and neutrinos as probes. These include: a high-statistics measurement of the cross section for the reaction pi(exp +)p yields pi(exp +)pi(exp 0)p to determine the 1 = 2 (pi)(pi) scattering length; precision measurements of the pi(exp -)p charge exchange cross section in the region of the Delta; measurements of the cross section for the (pi(exp +)p yields pi(exp +)pi(exp +)p), from D, He-3 and He-4 as tests of charge symmetry and reaction mechanisms; measurements of the pi(exp +)p cross section below the Delta; and studies of vp elastic scattering at low Q(exp 2) to determine the quark content of the proton spin. Some of these experiments acquired data last year, while others are presently running. LAMPF, the highest power proton accelerator in the world, is presently in the midst of its 1993 production run. MOMENTUM AND COORDINATE SPACE THREE-NUCLEON POTENTIALS
S. A. Coon and M. T. Pena (Continuous Electron Beam Accelerator Facility, Newport New, VA.) 10 Jun. 1993 32 p
(Contract DE-AC05-84ER-40150)
(DE93-040868; CEBAF-TH-93-09; DOE/ER-40150/236) Avail: CASI HC A03/MF A01

In this paper we give explicit formulae in momentum and coordinate space for the three-nucleon potentials due to rho and pi meson exchange, derived from off-mass-shell meson-nucleon scattering amplitudes which are constrained by the symmetries of QCD and by the experimental data. Those potentials have already been applied to nuclear matter calculations. Here we display additional terms which appear to be the most important for nuclear structure. The potentials are decomposed in a way that separates the contributions of different physical mechanisms involved in the meson-nucleon amplitudes. The same type of decomposition is presented for the pi minus pi TM force: The Delta isobar, the chiral symmetry breaking and the nucleon pair terms are isolated. DOE

Avail: Issuing Activity (Department of Energy (DOE))

The Global Color-symmetry Model of QCD is extended to deal with a background electromagnetic field and the associated conserved current is identified for composite (bar q)q pion modes of the model. Although the analysis is limited to tree level in the bilocal fields that bosonize the model, the identified photon-pion vertex produces the charge form factor associated with ladder Bethe-Salpeter pion amplitudes. A Ward-Takahashi identity for this vertex is derived in terms of the effective inverse propagator for the equivalent local pion field and the intrinsic ladder Bethe-Salpeter amplitudes. This identity is then used to illustrate gauge invariance by showing that identical vertex information is produced from the gauge change of the free action once proper account is taken of the gauge transformation properties of the bilocal pion fields. Comments are made on the location of the vector dominance mechanism in this treatment. DOE

ELECTRON SPECTROSCOPIC STUDIES OF THE NEUTRALIZATION OF SLOW MULTICHARGED IONS DURING INTERACTIONS WITH A METAL SURFACE
F. W. Meyer, L. Folkerts, C. C. Havener, I. G. Hughes, S. H. Overbury, D. M. Zehner, and P. A. ZeijlmansvanEmmichoven 1993 11 p Presented at the 18th International Conference on the Physics of Electronic and Atomic Collisions, Aarhus, Denmark, 21-27 Jul. 1993
(Contract DE-AC05-84OR-21400)
(DE93-041046; CONF-930711-1) Avail: CASI HC A03/MF A01

Recent experimental results of electron spectroscopic studies of the neutralization and relaxation of slow multicharged ions interacting with metal surfaces are summarized. Discussed are measurements of projectile K-Auger electron emission during interactions of N(sup 6+) ions with clean and cesiated Au, as well as clean Cu single crystal targets. While the dominant component in the measured K-Auger spectra is shown to be due to sub-surface electron emission, at incident perpendicular velocities below about 10(exp -2) au, small features become evident in the measured K-Auger spectra that are consistent with above surface projectile electron emission. Experimental results are compared with results of modelling studies of above- and sub-surface electron emission. Also presented are measurements of low energy electron emission during multicharged ion-surface interactions, together with a discussion and analysis of the various contributing low energy emission mechanisms. RELATIVISTIC CONFIGURATION INTERACTION CALCULATION OF THE CORRELATION ENERGIES OF HIGHLY-CHARGED IONS
M. H. Chen, K. T. Cheng, and W. R. Johnson (Notre Dame Univ., IN.) Jul. 1993 2 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-48)
(DE94-001055; UCRL-JC-114367) Avail: CASI HC A01

We are developing a new relativistic configuration interacion (CI) method for calculating the atomic structure of many-electron ions using complete finite basis sets constructed from B spline functions of piecewise polynomials. This method is based on the relativistic no-pair Hamiltonian from quantum electrodynamics (QED). Eigenfunctions of the Hamiltonican are expanded in a basis of configuration state functions constructed from products of one-electron orbitals. Eigenvaluses and eigenfunctions of the low-lying states of the ions are then determined by diagonalizing the Hamiltonian matrix which incudes the contributions both from the Coulomb and retarded Breit interactions. Derived from text

HIGH-RESOLUTION SOFT X RAY PHOTOIONIZATION STUDIES OF SELECTED MOLECULES Ph.D. Thesis
E. A. Hudson Aug. 1993 195 p
(Contract DE-AC03-76SF-00098)
(DE94-000568; LBL-34481) Avail: CASI HC A09/MF A03

Near-edge soft x ray photoionization spectra were measured for CO, SF6, H2S, and D2S in the gas phase, using the Free University of Berlin plane-grating SX-700-II monochromator at the synchrotron radiation source BESSY. Photoionization spectra of carbon monoxide were measured near the carbon and oxygen K edges. Vibrational spacings and bond lengths are derived for several resonances. Results are consistent with equivalent-core model and indicate the different influences of the carbon and oxygen 1s core holes. Corresponding spectra of H2CO and D2CO were also measured. Assignment of complex vibrational structure in valence-shell and Rydberg resonances is facilitated by comparison of spectra for the two isotopic species. Geometric and vibrational parameters are derived for several carbon 1s core-excited states. Isotopic shifts are observed in the energies and linewidths of some core-excited states. Sulfur hexafluoride photoionization spectra, measured near the sulfur L(sub 2,3) edges, show several series of weak, narrow Rydberg resonances. High resolution and good counting statistics allow a complete assignment of these states. Lineshapes of the broad inner-well resonances are analyzed to establish the magnitudes of vibrational and lifetime broadening in these states. Spectra of the H2S and D2S molecules were also measured near the sulfur L(sub 2,3) edges. Besides lower-energy transitions to inner-well states, a complex manifold of overlapping Rydberg resonances is observed. The rich fine structure of these states arises mainly from removal of orbital degeneracies in molecular field. Additional structure due to vibrational excitations in the final state is identified by comparison of the spectra for the two isotopic species. DOE

The inclusive single photon spectrum has been measured in the p(sub T) range from a few MeV/c up to approximately 1 GeV/c at several rapidities in the interval from -2.1 less than y(sub cm) less than +0.5 in 18 GeV/c proton-beryllium and proton-tungsten collisions at the Brookhaven AGS. The measured photon distributions are compared with the expected distribution of photons from (pi)(sup 0) decays and hadronic bremsstrahlung in a search for new sources of 'soft' photons at low transverse momentum. The question of whether or not any progress has been made on understanding and predicting the 13 parameters which describe the observed masses and mixing angles of the quarks and leptons is discussed. Arguments are given in favor of pursuing schemes in which grand unified and family symmetries provide many relations among these 13 parameters. A sequence of simple assumptions leads to a supersymmetric SO(10) theory with 8 predictions: tan (beta), m(sub t), V(sub cb), m(sub s), m(sub s)/m(sub d), m(sub u)/m(sub d), V(sub ub) and the amount of CP violation J. These predictions are presented together with experiments which will test them. DOE

NONLINEAR ION-MIXING-MODE PARTICLE TRANSPORT IN THE DISSIPATIVE TRAPPED ELECTRON REGIME
A. S. Ware and P. W. Terry Sep. 1993 37 p
(Contract DE-FG02-86ER-53218)
(DE94-000989; UW-CPTC-93-5) Avail: CASI HC A03/MF A01

The nonlinear particle transport arising from the convection of nonadiabatic electron density by ion temperature gradient driven turbulence is examined for trapped electron collisionality regimes. The renormalized dissipative nonadiabatic trapped electron phase space density response is derived and used to calculate the nonlinear particle flux along with an ansatz for the turbulently broadened frequency spectrum. In the lower temperature end of this regime, trapped electrons are collisional and all components of the quasilinear particle flux are outward (i.e., in the direction of the gradients). Nonlinear effects can alter the phase between the nonadiabatic trapped electron phase space density and the electrostatic potential, producing inward components in the particle flux. Specifically, both turbulent shifting of the peak of the frequency spectrum and nonlinear source terms in the trapped electron response can give rise to inward components. However, in the dissipative regime these terms are small, and the trapped electron response remains dominantly laminar. When the trapped electrons are collisionless, there is a temperature threshold above which the electron temperature gradient driven component of the quasilinear particle flux changes sign and becomes inward. For finite amplitude turbulence, however, turbulent broadening of both the electron collisional resonance and the frequency spectrum removes this threshold, and the temperature gradient driven component remains outward. PERTURBATION THEORY IN ELECTRON DIFFRACTION
L. N. Bakken, K. Marthinsen (Norges Tekniske Hoegskole, Trondheim.), and R. Hoeier (Norges Tekniske Hoegskole, Trondheim.) 8 Dec. 1992 6 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-201424; STF19-A92019) Avail: CASI HC A02

The Bloch-wave approach is used for discussing multiple inelastic electron scattering and higher-order perturbation theory in inelastic high-energy electron diffraction. In contrast to previous work, the present work describes three-dimensional diffraction so that higher-order Laue zone (HOLZ) effects are incorporated. Absorption is included and eigenvalues and eigenvectors are calculated from a structure matrix with the inclusion of an absorptive potential. Centrosymmetric as well as non-centrosymmetric crystal structures are allowed. An iteration method with a defined generalized propagation function for solving the inelastic coupling equations is described. It is shown that a similar iteration method with the same propagation function can be used for obtaining higher-order perturbation terms for the wave-function when a perturbation is added to the crystal potential. Finally, perturbation theory by matrix calculations when a general perturbation is added to the structure matrix is considered. NTIS

REACTIVITY OF AMBIDENT ANIONS IN THE GAS PHASE Ph.D. Thesis
Ivo. L. Freriks 15 Dec. 1992 126 p Sponsored by Netherlands Foundation for Chemical Research, and Nederlandse Organisatie voor Wetenschappelijk Onderzoek, The Hague Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-232189) Avail: CASI HC A07

Ambident anions are negative ions in which several reactive centra are coupled via resonance. When these ions react, there is a competition possible between the reaction channels via each of these reactive centra. A systematic study on the reactivity of several ambident anions in a Fourier transform ion cyclotron resonance mass spectrometer is described in the thesis. Via probe reactions it is shown that a gas-phase ion/molecule reaction between an ambident anion and an unsaturated polyfluorocarbon compound enables a distinction between the competing reaction channels mentioned. The obtained product distributions can be interpreted using simple perturbation theory. In chapter one of the thesis several models and concepts (such as hard and soft acids and bases, HSAB, perturbation theory and the Allopolarisierungs-Prinzip) are described which have been used previously to explain the reactivity of ambident ions in solution. LOW MASS MUON PAIR PRODUCTION IN 450 GeV p-Be COLLISIONS Ph.D. Thesis
R. J. Veenhof 12 May 1993 132 p Sponsored by Stichting voor Fundamenteel Onderzoek der Materie and European Organization for Nuclear Research Prepared in cooperation with Natio naal Inst. voor Kernfysica en Hoge Energiefysica, Amsterdam, Netherlands
(PB94-110699) Avail: CASI HC A07/MF A02

The Helios experiment was proposed in 1983 to investigate in detail the origin of low mass lepton pairs. The Helios setup combines an electron spectrometer, a muon spectrometer, a photon detector, almost hermetic calorimetry and a device to measure the multiplicity. The Helios detector is described in Chapter 2.0 with particular emphasis on the performance of the drift chamber system. The event selection and the reconstruction of the muons is described in Chapter 3.0. Chapter 4.0 summarizes the current knowledge of the decays of mesons into low mass muon pairs. The author's own measurements of meson properties are presented in Chapter 5.0. The question whether one needs anomalous pairs to explain the data, is answered in Chapter 6.0. Helios reaches the conclusion that there is no evidence for the production of anomalous pairs at central rapidity and low p(sub T) in pBe collisions. This result complements the recent finding of the RISK experiment, which is also able to observe Dalitz decays, that low mass lepton pair production in the forward region in pi(-)C interactions is compatible with meson decays. The collisions of photons at a high energy electron-positron collider provide a comprehensive laboratory for testing QCD, electroweak interactions, and extensions of the standard model. It is expected that by using back-scattered laser beams that the effective luminosity and energy of photon-photon collisions will be comparable to that of the primary e(+)e(-) collisions. In this talk, I will focus on tests of electroweak theory in photon-photon annihilation such as (gamma)(gamma) yields W(+)W(-), (gamma)(gamma) yields Higgs boson, and higher-order loop processes, such as (gamma)(gamma) yields (gamma)(gamma), Z(gamma) and ZZ. Since each photon can be resolved into a W(+)W(-) pair, high energy photon-photon collisions can also provide a remarkable background-free laboratory for studying WW collisions and annihilation. I also review high energy (gamma)(gamma) tests of quantum chromodynamics, such as the scaling of the photon structure function, t(bar t) production, mini-jet processes, and diffractive reactions. DISORDER EFFECTS ON SMALL-POLARON FORMATION AND HOPPING
D. Emin 1993 10 p Presented at the 5th International Conference on Hopping and Related Phenomena, Glasgow (United Kingdom), 31 Aug. - 3 Sep. 1993
(Contract DE-AC04-76DP-00789)
(DE94-001205; SAND-93-2046C; CONF-930879-1) Avail: CASI HC A02/MF A01

Small-polarons will only form in covalent crystals whose electronic halfbandwidths are sufficiently narrow, E(sub b) greater than W. The absence of small polaronic carriers in most covalent crystals presumably indicates that E(sub b) less than W in these instances. However, evidence of small polarons is commonly found in disordered materials despite the estimates of E(sub b) and W not being significantly different from those of crystals. This result is rationed by stating that disorder has slowed carrier motion enough to permit small-polaron formation. Recently the question of how disorder affects the stability of quasifree carriers with respect to small-polaron formation was addressed. It is found that only modest energetic disorder is required to induce small-polaron formation. I first succinctly describe essential elements of this work. Second, I address the role of disorder on the adiabatic hopping motion of small polarons. Energy bands in most materials in which small-polarons are found are thought to be sufficiently wide (greater than a phonon energy) that the small-polaronic hopping is 'adiabatic.' That is, the electronic carriers move between sites sufficiently rapidly to follow the atomic motions. In this situation the small-polaron jump rates are independent of intersite separations. The magnitudes of the preexponential factors of the measured hopping mobilities typically support this view. Further support for this picture is found from experiments that determine weak dependences of the mobility on hydrostatic pressure. DOE

B-QUARK PRODUCTION AT HADRON COLLIDERS
Ruibin Meng and S. Riemersma (Southern Methodist Univ., Dallas, TX.) Aug. 1993 10 p Presented at the Workshop on B Physics at Hadron Colliders, Snowmass, CO, Jun. 1993 Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contract W-31-109-eng-38)
(DE94-001459; ANL-HEP-CP-93-66; CONF-9306258-3) Avail: Issuing Activity (Department of Energy (DOE))

Studying B-physics at hadron accelerators requires a good understanding of the total and differential cross sections for b-quark production. This knowledge gives those involved in B(bar B) mixing, rare B decays, and those trying to determine the CKM angles (alpha), (beta), and (gamma) an idea of how many events they can expect, given the luminosity and the branching ratios. It is particularly important for those studying rare B decays as they set limits on where we can hope to see new physics. For these reasons and others, the complete (Omicron)((alpha)(sub s)(sup 3)) corrections to heavy-quark production at hadron accelerators were calculated in. Also three groups have attempted to calculate heavy-quark production using resummation techniques in the small-x kinematic region. These resummation techniques are necessary since the b-quark mass m(sub b) is small relative to the center-of-mass energies (radical)S of the TeVatron and the SSC. While these techniques offer some hope of obtaining reasonable predictions for b-production at these machines, the current results can best be considered as preliminary. Thus we must turn to fixed-order perturbative QCD for guidance, as we have no other real choice at this point. However, let us submit a caveat here: fixed-order perturbative QCD works best when all the scales are roughly comparable, i.e. (radical)s is approximately equal to m(sub b) approximately equal to p(sub t), (radical)s being the partonic center-of-mass energy. When we are not in this regime, for example at the TeVatron and the SSC, our predictions will then be less reliable. Bearing this in mind, let us continue to the results section. DOE

OPTICAL SPIN POLARIZATION AND STATE-SENSITIVE DETECTION OF A CESIUM ATOMIC BEAM
B. Jaduszliwer and Y. C. Chan 15 Jan. 1994 9 p Repr. from Physical Review A (American Physical Soceity), v. 48, no. 3, Sep. 1993 p 1050-2947
(ATR-92(8436)-1) Copyright Avail: Issuing Activity

A cesium atomic beam having a high degree of polarization is prepared by optical pumping with two circularly polarized diode lasers, and a technique for state-sensitive atomic detection involving laser induced fluorescence in a magnetic field (LIFB) is introduced. An atomic-beam polarization of 93 percent is measured using the LIFB technique, and the combined use of optical-state preparation and LIFB detection in an atomic-recoil experiment to study spin-changing electron-atom collisions is demonstrated.

The development of hypersonic aerospace vehicles requires a better understanding on the thermal and chemical nonequilibrium kinetics of participating species in shock layers. The computational fluid dynamic (CFD) codes developed for such flowfields overestimate the radiation in the spectral region of 300 - 600 nm. A speculation for this overestimation is that inclusion of Ar, CO2, and H2O at the upper atmosphere flight region makes a significant impact on radiative kinetics of molecular nitrogen ions. To define the effects of minority species on the radiative kinetics of N2(+), an experimental setup was made by using the helium Penning ionization. The vibrational and rotational temperature were measured by mapping the vibrational and rotational distributions of N2(+) emission with high spectroscopic resolution and absolute intensity measurements. Measured vibrational temperatures were in the range from 18,000 to 36,000 K, and rotational temperatures were in the range from 300 to 370 K. The irradiance of 391.44 nm line and rotational and vibrational temperatures were analyzed to define argon and CO2 effects on the N2(+) emission. When Ar or CO2 is injected with N2, the rotational temperature did not change. The irradiances were reduced by 34 percent and 78 percent for the 50 percent of mixture of Ar and CO2, respectively. The vibrational temperatures were increased by 24.1 percent and 82.9 percent for the 50 percent of mixture of Ar and CO2, respectively. It appears that there are no significant effects from small concentrations of Ar and CO2 at the upper atmosphere flight region. Author (revised)

EFFECTS OF IONIZING RADIATION ON MODERN ION EXCHANGE MATERIALS
S. Fredric Marsh and K. K. S. Pillay Oct. 1993 25 p
(Contract W-7405-eng-36)
(DE94-001569; LA-12655-MS) Avail: CASI HC A03/MF A01

We review published studies of the effects of ionizing radiation on ion exchange materials emphasizing those published in recent years. A brief overview is followed by a more detailed examination of recent developments. Our review includes styrene/divinylbenzene copolymers with cation-exchange or anion-exchange functional groups, polyvinylpyridine anion exchangers, chelating resins, multifunctional resins, and inorganic exchangers. In general, strong-acid cation exchange resins are more resistant to radiation than are strong-base anion exchange resins, and polyvinylpyridine resins are more resistant than polystyrene resins. Cross-linkage, salt form, moisture content, and the surrounding medium all affect the radiation stability of a specific exchanger. Inorganic exchangers usually, but not always, exhibit high radiation resistance. Liquid ion exchangers, which have been used so extensively in nuclear processing applications, also are included. DOE

EXPERIMENTAL AND THEORETICAL FEATURES OF STRONG SUPPRESSION AND SHIFTING PHENOMENA IN ODD-PHOTON RESONANT EXCITATIONS AND STIMULATED EMISSIONS
W. R. Garrett 1993 5 p Presented at the 11th International Conference on Laser Spectroscopy, Hot Springs, VA, Jun. 1993
(Contract DE-AC05-84OR-21400)
(DE94-000341; CONF-9306200-1) Avail: CASI HC A01/MF A01

Descriptions are given of recent theoretical and experimental results of dramatic effects, during the interval of the excitation pulse, in optically pumped stimulated emissions (OPSE). Forward-directed OPSE from a two-photon resonantly excited state to a lower state which is also coupled to the ground state is strongly suppressed and backward emissions are frequency shifted. Surprisingly, the effects are caused by an interference from a wave-mixing field. Several other implications of this effect are given and, on the basis of this phenomenon, several puzzling ASE observations mentioned in other published work are noted and clarified. DOE

INTERACTIONS BETWEEN ORGANIZED, SURFACE-CONFINED MONOLAYERS AND VAPOR-PHASE PROBE MOLECULES. 7: COMPARISON OF SELF-ASSEMBLYING ORGANOMERCAPTAN MONOLAYERS DEPOSITED ON GOLD FROM LIQUID AND VAPOR PHASES Report, 1 Aug. 1992 - 31 Jul. 1993
O. Chailapakul, L. Sun, C. Xu, and R. M. Crooks 23 Nov. 1993 11 p
(Contract N00014-91-J-1991)
(AD-A273196) Avail: CASI HC A03/MF A01

A comparative study of the structure and chemistry of methyl-terminated n-alkanethiol self-assembling monolayers (SAM's) formed from liquid and vapor phases is reported. Three different SAM's are considered: Au/HS(CH2)(sub n)CH3, n = 5, 11, and 15. Liquid-phase-deposited films were prepared by exposure of Au substrates to dilute ethanol solutions of the n-alkanethiols followed by ethanol rinsing, and vapor-phase-deposited SAM's were prepared by exposure of the Au surface to 10%-of-saturation n-alkanethiol vapors followed by N2 purging, which removes loosely bound n-alkanethiol molecules from the surface. The matrix of 6 organic surfaces were studied by FTIR external reflectance spectroscopy (FTIR-ERS), ellipsometry, and cyclic voltammetry, which provide information about the average structure of the SAM's, and a newly developed scanned tunneling microscope (STM)-based method, which provides information about individual SAM defect structures. FTIR-ERS and ellipsometry indicate no detectable differences between liquid- and vapor-phase-deposited SAM's. Data obtained using cyclic voltammetry and STM show that the barrier properties of SAM's depend on the ambient phase from which the SAM assemblies, the length of the n-alkanethiol, and the chemical nature of the molecular probe used to evaluate the monolayer structure. INTEGRAL EQUATIONS FOR THE MICROSTRUCTURES OF SUPERCRITICAL FLUIDS
L. L. Lee and H. D. Cochran 1993 67 p Presented at the NATO Advanced Study Institute on Composition, Geochemistry and Conversion of Oil Shales and Supercritical Fluids, Akcay, Turkey, 18-31 Jul. 1993
(Contract DE-AC05-84OR-21400)
(DE94-002460; CONF-930776-3) Avail: CASI HC A04/MF A01

Molecular interactions and molecular distributions are at the heart of the supercritical behavior of fluid mixtures. The distributions, i.e. structure, can be obtained through any of the three routes: (1) scattering experiments, (2) Monte Carlo or molecular dynamics simulation, and (3) integral equations that govern the relation between the molecular interactions u(r) and the probability distributions g(sub ij)(r). Most integral equations are based on the Ornstein-Zernike relation connecting the total correlation to the direct correlation. The OZ relation requires a 'closure' equation to be solvable. Thus the Percus-Yevick, hypernetted chain, and mean spherical approximations have been proposed. The authors outline the numerical methods of solution for these integral equations including the Picard, Labik-Gillan, and Baxter methods. Solution of these equations yields the solvent-solute, solvent-solvent, and solute-solute pair correlation functions (pcf's). Interestingly, these pcf's exhibit characteristical signatures for supercritical mixtures that are classified as 'attractive' or 'repulsive' in nature. Close to the critical locus, the pcf shows enhanced first neighbor peaks with concomitant long-range build-ups (sic attractive behavior) or reduced first peaks plus long-range depletion (sic repulsive behavior) of neighbors. For ternary mixtures with entrainers, there are synergistic effects between solvent and cosolvent, or solute and cosolute. These are also detectable on the distribution function level. The thermodynamic consequences are deciphered through the Kirkwood-Buff fluctuation integrals (G(sub ij)) and their matrix inverses--the direct correlation function integrals (DCFI's). These quantities connect the correlation functions to the chemical potential derivatives (macroscopic variables) thus acting as 'bridges' between the two world views. DOE

ELECTRO-WEAK, QCD AND TOP PHYSICS AT THE TEVATRON

H. T. Diehl Sep. 1993 16 p Presented at the Workshop on Physics at Current Accelerators and the Supercollider, Argonne, IL, 2-5 Jun. 1993
(Contract DE-AC02-76CH-03000)
(DE94-002304; FNAL/C-93/286; CONF-9306176-12) Avail: CASI HC A03/MF A01

The 1992-1993 Tevatron collider run ended yesterday. Approximately 21 (16)pb(exp -1) of p(bar-p) collisions at the square root of S = 1800 GeV were collected at CDF (D0). New measurements of the W and Z cross section x branching ratios indicate that Gamma(W) is 2.033 +/- 0.069 +/- 0.057 GeV. The upper limit for the top quark mass, if it is produced in W decays, is 62 GeV/cu c. Gauge boson pair production studies are beginning to constrain electro-weak parameters. No neutral gauge bosons with mass greater than M(sub z) have appeared. Inclusive jet production and angular distribution studies are compared to NLO perturbative QCD predictions. A new topological jet analysis from CDF is sensitive to the low x gluon distribution. The direct photon cross section shows a steeper fall-off with E(sub t) than does the theory prediction. D0 has one candidate t(bar-t) event in the dilepton mode. The lower limit on M(sub T(sub op)) has been raised to 99 GeV/sq c. DOE

MATTER-WAVE INTERFEROMETRY WITH LASER COOLED ATOMS Final Report
David McIntyre Nov. 1993 13 p
(Contract N00014-91-J-1198)
(AD-A273249) Avail: CASI HC A03/MF A01

This research program is concerned with matter-wave interferometry of laser cooled atoms. A slow beam of laser cooled rubidium atoms will be used as the matter-wave source. The atom optical elements are microfabricated amplitude transmission gratings which will be used in a three-grating interferometer to split and recombine the rubidium beam. The atomic interferometer will be a useful new tool with which to perform precision experiments in atomic physics, quantum optics, and gravitation. The research program takes advantage of three new technologies, the combination of which provides a unique opportunity to construct a compact and stable interferometer. The techniques of laser cooling and trapping are used to produce cold rubidium atoms in a well-collimated beam. Commercially available diode lasers with optical feedback frequency stabilization are used for the laser cooling and trapping beams and for atomic beam diagnostics. Finally, submicron transmission gratings made with high-resolution electron-beam lithography are used as the coherent beam splitters of the atomic interferometer. DTIC

We have used self-assembly chemistry to synthesize monolayer assemblies that function as molecular recognition interfaces. In the first part of this paper, we show that one-component self-assembled n-alkanethiol monolayers with carboxylic acid functionalized endgroups specifically adsorb vapor-phase acid-terminated molecules via hydrogen bonding or vapor-phase amine-terminate molecules via proton-transfer interactions. In the second part, we demonstrate that two-component monolayers, which consist of inert n-alkanethiol framework molecules and defect-inducing template molecules, can discriminate between solution-phase probe molecules based on their physical and chemical characteristics. By electrochemically etching the defects and then imaging the resulting surface by scanning tunneling microscopy, the defect sites can be indirectly visualized. DTIC

APPLICATION AND DEVELOPMENT OF THE SCHWINGER MULTICHANNEL SCATTERING THEORY AND THE PARTIAL DIFFERENTIAL EQUATION THEORY OF ELECTRON-MOLECULE SCATTERING Final Report
Charles A. Weatherford 17 Dec. 1993 83 p
(Contract NCC2-492)
(NASA-CR-194774; NAS 1.26:194774) Avail: CASI HC A05/MF A01

One version of the multichannel theory for electron-target scattering based on the Schwinger variational principle, the SMC method, requires the introduction of a projection parameter. The role of the projection parameter a is investigated and it is shown that the principal-value operator in the SMC equation is Hermitian regardless of the value of a as long as it is real and nonzero. In a basis that is properly orthonormalizable, the matrix representation of this operator is also Hermitian. The use of such basis is consistent with the Schwinger variational principle because the Lippmann-Schwinger equation automatically builds in the correct boundary conditions. Otherwise, an auxiliary condition needs to be introduced, and Takatsuka and McKoy's original value of a is one of the three possible ways to achieve Hermiticity. In all cases but one, a can be uncoupled from the Hermiticity condition and becomes a free parameter. An equation for a based on the variational stability of the scattering amplitude is derived; its solution has an interesting property that the scattering amplitude from a converged SMC calculation is independent of the choice of a even though the SMC operator itself is a-dependent. This property provides a sensitive test of the convergence of the calculation. For a static-exchange calculation, the convergence requirement only depends on the completeness of the one-electron basis, but for a general multichannel case, the a-invariance in the scattering amplitude requires both the one-electron basis and the N plus 1-electron basis to be complete. The role of a in the SMC equation and the convergence property are illustrated using two examples: e-CO elastic scattering in the static-exchange approximation, and a two-state treatment of the e-H2 Chi(sup 1)Sigma(sub g)(+) yields b(sup 3)Sigma(sub u)(+) excitation. NEW EVALUATION OF HADRONIC CONTRIBUTIONS TO THE ANOMALOUS MAGNETIC MOMENT OF CHARGED LEPTONS
A. Z. Dubnickova, S. Dubnicka, and P. Strizenec 1992 14 p
(DE93-634394; JINR-E-2-92-281) Avail: CASI HC A03/MF A01 (US Sales Only)

A re-evaluation of the lowest-order hadronic vacuum-polarization contribution to the anomalous magnetic moment of the electron, muon, and tau-lepton with a higher precision in comparison with previous estimates is carried out. The latter is achieved because new data on some exclusive processes have appeared recently, more accomplished models for a description of the pion and kaon electromagnetic structure were developed and the revised (due to a new value of the coefficient of the third power of alpha(sub s)) QCD formula for R = sigma(sub tot) (e(sup +)e(sup -) yields (had)/sigma(sub tot) (e(sup +)e(sup -) yields mu(sup +)mu(sup -)) with electroweak corrections was applied to analyze all existing data in a proper way. The final results are a(sub e)(sup (2)had) = (1.810 (+-) 0.011 (+-) 0.002) x 10(sup -12) a(sub mu)(sup (2)had) = (6.986 (+-) 0.042 (+-) 0.016) x 10(sup -8) and a(sub tau)(sup (2)had) = (3.436 (+-) 0.024 (+-) 0.024) x 10(sup -6). A RESEARCH OF POSSIBILITY FOR NEGATIVE MUON PRODUCTION BY A LOW ENERGY ELECTRON BEAM ACCOMPANYING ION BEAM
Joshin Uramoto Dec. 1993 39 p
(NIFS-266) Avail: CASI HC A03/MF A01

A low energy electron beam (less than or equal to 2000 eV) is injected perpendicularly into a uniform magnetic field, together with a low energy positive ion beam. On this magnetic mass analysis (using the uniform magnetic field), a peak of secondary electron current to the beam collector (arranged as a mass analyzer of 90 deg type), appears at an analyzing magnetic field which corresponds exactly to a relation of negative muon, mu- (the mass m = 207 m(sub e) and the charge q = e, where m(sub e) and e are mass and charge of electron). The ion beam is essential for the peak appearance, which is produced by decelerating electrically the electron beam in front of the entrance slit of the mass analyzer, and by introducing a neutral gas into the electron beam region and producing a plasma through the ionization. We consider that a very small amount of negative muons may be produced through local cyclotron motions of the injected beam electrons in the ion beam or by an interaction between the bunched beam electrons and beam ions. STRUCTURES OF Cl(-)(H2O)(n) AND F(-)(H2O)(n) (n EQUAL TO 2,3...15) CLUSTERS: MOLECULAR DYNAMICS COMPUTER SIMULATIONS Technical Report, 1 Jul. 1993 - 30 Jun. 1994
L. Perera and M. Berkowitz Nov. 1993 43 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-89-J-1169)
(AD-A273474) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

We have performed molecular dynamics calculations on Cl(-)(H2O)n and F(-)(H2O)n (n=2,3,...15) clusters. The calculations show that the F(-) ion is solvated in these clusters, while Cl(-) remains attached to the water in the clusters. We also obtained the minimum energy structures for the Cl(-)(H2O)n and F(-)(H2O)n (n=6,7,8) clusters. From the comparison of these structures with the dynamical structures we conclude that the solvation of F(-) ion is due to the entropy effect. DTIC

NUCLEAR MAGNETIC RESONANCE IMAGING WITH SHORT GRADIENT PULSES Patent
David G. Cory, inventor (to Navy), Joel B. Miller, inventor (to Navy), and Allen N. Garroway, inventor (to Navy) 13 Jul. 1993 11 p Filed 29 Nov. 1990
(AD-D016006; US-Patent-5,227,725; US-Patent-Appl-SN-619567; US-Patent-Class-324-309) Avail: US Patent and Trademark Office

An improved method and apparatus for nuclear magnetic resonance (NMR) imaging are provided by intercalating a magnetic field gradient in the form of short pulses into an NMR line-narrowing sequence. By inserting the short pulses into predetermined windows in the line-narrowing pulse sequence, the resolution of NMR images obtained thereby is increased and image artifacts from homogenous contributions to the natural linewidth are reduced. Furthermore, the short gradient pulses may be intercalated into known multiple pulse sequences or new multiple pulse sequences for specific imaging purposes which allows far more freedom in designing efficient and improved pulse cycles for NMR imaging. COMPUTER SIMULATION OF LOW ENERGY SCATTERING Ph.D. Thesis
Camillus Adrianus Severijns 1992 110 p
(ETN-94-95326) Avail: CASI HC A06/MF A02

Two relevant aspects for the interpretation of data obtained with the surface analysis technique Low Energy Ion Scattering (LEIS) are studied: neutralization and the tail at the low energy side of the surface peak in energy spectra. A simulation code called SISS-92 (Simulation of Ion Surface Scattering 1992) was developed. With LEIS both the chemical composition and the structure of a surface can be determined. The differences that can appear between the surface and the bulk, are pointed out. An overview of the computer models in the literature is given. The structure of the SISS-92 code is described. When selecting a numerical technique, its accuracy is a major consideration. An efficient and accurate numerical approximation of the classical collision integrals is based on rational functions. An algorithm for calculating such an approximation is described. The searching for a target atom is also an often performed and time consuming task in a simulation. A fast method for searching and for calculating the data needed in the searching is given. The results of simulations with the SISS-92 code are compared to experimental data. Analytical results for the neutralization integral that generalize the results of Godfrey-Woodruff and Richard-Eschenbacher are presented. The influence of the approximating ion trajectory is studied. Several charge exchange models are used to study the neutralization of Ne(+) ions scattering from the Ni(100) surface. Both localized and non localized models are used. The shape of the tails extending from the surface peaks in energy spectra are studied. ESA

SYNTHESIS OF MOLECULAR WIRES BY A NOVEL DIVERGENT/CONVERGENT APPROACH
James M. Tour and Jeffry S. Schumm 22 Nov. 1993 9 p
(Contract N00014-89-J-3062)
(AD-A273332; TR-26; ONR-TR-26) Avail: CASI HC A02/MF A01

Described is the synthesis of oligo(2-ethylphenyl -ethynylene)s and oligo(2-(3'ethylheptyl) phenyl-ethynylene)s via an iterative divergent convergent approach. Synthesized were the monomer, dimer, tetramer, and octamer of the ethyl derivative and the monomer, dimer, tetramer, octamer, and 16-mer of the ethylheptyl derivative. The 16-mer is 128 A long. At each stage in the iteration, the length of the framework doubles. Only three sets of reaction conditions are needed for the entire iterative synthetic sequence; an iodination, a protodesilation, and a Pd/Cu-catalyzed cross coupling. The oligomers were characterized spectroscopically and by mass spectrometry. DTIC

MICROSCOPIC DYNAMICS IN DENSE HELIUM-NEON MIXTURES: NEUTRON SCATTERING, KINETIC THEORY AND COMPUTER SIMULATIONS Ph.D. Thesis
Peter Westerhuijs 1992 139 p
(ISBN-9-07-386105-5; ETN-94-95370) Avail: CASI HC A07/MF A02

The microscopic dynamics in eleven dense helium-neon gas mixtures is investigated by means of neutron scattering, kinetic theory and computer simulations. The concentration ratio of helium in the mixture is varied from 0 to 1 at temperatures of 39 and 47 K and pressures between 114 bar and 285 bar. The study is made by considering the partial and total dynamic structure factors of the mixture. The question is addressed how the behavior of two fundamental quantities in simple dense noble gas fluids, that is, the decay frequency of microscopic density fluctuations and the sound dispersion of small scale sound oscillations extend to the simplest of all binary mixtures: He-Ne. ESA

THE L3 VISUALIZATION SYSTEM AND ITS USE IN THE Z(ZERO) LINE SHAPE ANALYSIS Ph.D. Thesis
Rene Wilhelm 1992 115 p Sponsored by Stichting voor Fundamenteel Onderzoek der Materie, Netherlands Original contains color illustrations
(ETN-94-95382) Avail: CASI HC A06/MF A02

The design and implementation of an interactive graphics system that can visualize the events registered by the L3 detector, which is located at the Large Electron Positron (LEP) collider, are presented. The different components of the detector and the online system of data acquisition and monitoring are described. The following components of the offline software base are presented: reconstruction, simulation, data base and graphics. The graphics software is discussed showing design principles and the implementation on Apollo computers. The analysis of the Z neutral line shape, from which several parameters of the Standard Model are extracted with great precision, is performed. ESA

N94-25239# Technische Univ., Eindhoven (Netherlands). Dept. of Physics.
ULTRACOLD ATOMS IN TRAPS AND FOUNTAINS Ph.D. Thesis
Eite Tiesinga 1993 109 p Sponsored by Netherlands Organization for the Advancement of Scientific Research
(ETN-94-95325) Avail: CASI HC A06/MF A02

Six papers or manuscripts of papers, each addressing a different aspect of ultracold atoms, are presented. Collisions of cesium (Cs-133) atoms in a magnetic trap with a special emphasis on resonances and centrifugal barrier phenomena are described. Possibilities to realize the Bose-Einstein condensed state in such a trap are considered. Hyperfine changing collisions of magnetically trapped sodium (Na-23) atoms, of importance for estimating the decay of the atomic density in a magnetic trap, are described. The collisional frequency shift is the only frequency shift in a cesium atomic fountain clock which cannot be reduced by reducing atomic velocities and as such constitutes an essential limitation for cold cesium clocks. This shift and its consequences for the accuracy are described. Measurements of the hyperfine induced spin exchange parameter for the hydrogen maser show a discrepancy in sign with the predicted value calculated a few years ago by another group. This discrepancy is one of the motivations for the theoretical study of the atomic deuterium maser. A comparison with experiment may contribute to an explanation for the discrepancy. The reflection of a hydrogen atom against a superfluid helium surface is studied with special attention for the role of the long wavelength ripplons. ESA

INTRAMULTIPLET MIXING FOR Ne(**)(3p)+He AT SUPERTHERMAL ENERGIES Ph.D. Thesis

Willem Boom 1993 160 p

(ETN-94-95327) Avail: CASI HC A08/MF A02

The mechanisms of fine structure changing transitions within the multiplet of short lived, laser excited neon atoms due to collisions with ground state helium atoms are investigated. These transitions are commonly referred to as intramultiplet mixing. Electronically excited states play an important role in gas lasers, plasma physics, and gas discharges. The orientation of the outer 3p valence electron with respect to the collision partner can strongly influence the collision dynamics. The use of a hollow cathode arc Ne source enables study of intramultiplet mixing at superthermal collision energies between 200 and 1200 meV. From a theoretical point of view, the experimental cross sections can be directly compared with fully quantum mechanical coupled channels calculations. Large discrepancies on the order of a factor of two between experimental and quantum mechanically calculated cross section magnitudes are found. A semiclassical model, strongly enhancing insight into the transition dynamics of intramultiplet mixing, was developed. ESA

N94-25246 Amsterdam Univ. (Netherlands).

THE DETERMINATION OF THE BRANCHING RATIOS OF THE Z(ZERO) BOSON INTO HEAVY QUARKS USING NEURAL NETWORKS Ph.D. Thesis

Nicolo deGroot 1993 97 p Sponsored by Stichting voor Fundamenteel Onderzoek der Materie, Netherlands Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ETN-94-95381) Avail: CASI HC A05

The measurement of the branching ratios of the Z neutral boson into heavy quarks is discussed. The purpose is twofold: measuring the branching ratios and studying the feasibility of the use of neural networks. It is demonstrated that it is possible to identify events with heavy flavored quarks in a reliable way. The results obtained for the branching ratios are stable under a large variety of systematic effects and the method is competitive with others. The physics at the Large Electron-Positron (LEP) accelerator is reviewed and neural networks are introduced. A description of the LEP accelerator, the DELPHI (Detector with Lepton, Proton and Hadron Identification) detector, the analysis chain and the inner detector is given. The analysis of the branching ratio of the Z neutral into heavy quarks is presented. ESA

N94-25255# Amsterdam Univ. (Netherlands).

BOTTOM QUARK PRODUCTION AT THE Z RESONANCE Ph.D. Thesis

Tim Foreman 1993 154 p Sponsored by Stichting voor Fundamenteel Onderzoek der Materie, Netherlands

(ISBN-9-09-006217-3; ETN-94-95383) Avail: CASI HC A08/MF A02

Study of heavy flavor production, in particular the production of the bottom quark, and its implications on the Standard Model parameters is presented. The attention is focused on the part of the analysis that is done by muon tagging only. The phenomenological models invented to describe this process are explained. B neutral-anti B neutral mixing, a second order process in which a B meson oscillates between two mass eigenstates, is modeled and the decay of B hadrons is described. A detailed description of the L3 muon detector is given together with the other subdetectors. The L3 muon detector consists of two Ferris wheels each containing eight independent units called octants. Each octant is made out of five precision drift chambers. The L3 muon simulation and reconstruction and the selection of heavy flavors are discussed. The mixing parameter and the branching ratio are determined and the observed forward backward asymmetry is measured. ESA

N94-25259 Amsterdam Univ. (Netherlands).

RELATIVISTIC HADRONS IN AN EXTERNAL FIELD Ph.D. Thesis

Robert Peter Oderkerk 1992 224 p Sponsored by Stichting voor Fundamenteel Onderzoek der Materie Prepared in cooperation with Nationaal Inst. voor Kernfysica en hoge Energiefysica, Amsterdam, Netherlands, and Erlangen-Nuernberg Univ., Germany Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(ETN-94-95387) Avail: CASI HC A10

The model dependence of the impulse approximation for proton-nucleus elastic scattering stemming from off-shell and non local effects is investigated. A perturbative treatment allows a direct comparison between off-shell and relativistic effects. Off-shell effects are found to be significantly smaller and unable to account in a natural way for the needed repulsive central potential in the nuclear interior region at proton energies between 300 and 880 MeV. A further problem connected to Dirac phenomenology is also studied: the extent to which it is possible to describe a composite particle with an equation which is valid for relativistic point particles. The issue is investigated within the framework of a solvable field theoretic model: quantum chromodynamics in one space and one time dimension in the limit of a large number of colors. ESA

A SCALAR-VECTOR MODEL OF QUARK-ANTIQUARK INTERACTION UNDER LINEAR CONFINEMENT

S. Chakrabarty Aug. 1992 16 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(DE93-616871; IC-92/200) Avail: CASI HC A03 (US Sales Only)

Considering the idea that the constituent quark mass is the dressed sum of current quark mass and dynamical quark mass, and using the standard values of current quark masses, we obtain approximate values of constituent quark masses, which are then used in our extensively studied Bethe-Salpeter-reduced potential model. We find that the mass formulas become much simpler for linear potential ar with zero anomalous magnetic moment lambda, the values of scalar-vector fraction ((eta)) and 'a' in the linear potential being (1/4) and (1/5), respectively. Also, some of the quantities can be related to each other and the match with experimental data is good. DOE

LOCALIZED EXCITATIONS IN COMPETING BOND-ORDER-WAVE, CHARGE-DENSITY-WAVE AND SPIN-DENSITY-WAVE SYSTEMS. 2: COMPETING CHARGE-DENSITY-WAVE AND SPIN-DENSITY-WAVE

Wen-Zheng Wang, Chui-Lin Wang (China Center for Advanced Science and Technology, Beijing.), Zhao-Bin Su, and Lu Yu Nov. 1992 38 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(DE93-617131; IC-92/380) Avail: CASI HC A03 (US Sales Only)

The extended Peierls-Hubbard model is used to study the competition of the spin-density-wave (SDW) and charge-density-wave (CDW) states as well as the attendant localized excitations in quasi-one-dimensional systems like MX-chains. The ground state properties are first studied as a function of the Coulomb interaction U and the on-site electron-phonon coupling lambda(sub 2). The SDW state dominates in the region of large U and small lambda(sub 2), while the CDW state prevails in the opposite limit. In the intermediate region these two states compete with each other, one being stable, whereas the other being metastable. The localized excitations (polarons and excitons) are studied in detail in each region using the Bogoliubov-de Gennes formalism. The self-trapped excitons (STE) in the CDW dominating regime contain locally non-vanishing SDW distortions and vice versa. As lambda(sub 2) increases, the number of bound states changes from two to four for the exciton case and from two to three for the polaron case. Upon its further increase, one type of STE with a certain pattern of SDW distortion and charge transfer is transforming into another type of STE with a different pattern. The possibilities of verifying the ground state properties in optical and transport experiments and identifying these local excitations in Raman and ENDOR measurements are discussed. DOE

INFRARED FLUORESCENCE STUDIES OF ELECTRONIC-TO-VIBRATIONAL ENERGY TRANSFER IN A Br2:NO SYSTEM M.S. Thesis

Michael R. Hawks Dec. 1993 70 p

(AD-A273727; AFIT/GAP/ENP/93D-03) Avail: CASI HC A04/MF A01

Steady-state photolysis techniques were used to study electronic-to-vibrational energy transfer mechanisms from atomic bromine to nitric oxide. Molecular bromine was photodissociated by 488nm radiation to produce equal parts Br(P-2)(sub 1/2) and Br(P-2(sub 3/2). Side fluorescence intensity from Br(P-2)(sub 1 /2) at 2.7 microns and from No (v = 1 and 2) around 5.3 microns measured as a function of bromine pressure and nitric oxide pressure. The branching ratio collisional transfer into the first and second states of NO was determined, and previously reported rates for quenching of No by molecular bromine were verified. DTIC

HEAVY FLAVOUR PHYSICS AT LEP

Peter M. Kluit 1992 23 p Presented at 20th SLAC Summer Institute on Particle Physics Topical Conference, Jul. 1992

(NIKHEF-H/92-19; ETN-94-95046) Avail: CASI HC A03/MF A01

The European Large Electron Positron (LEP) storage ring results on heavy flavor physics are summarized. The topics covered are: the B physics at the Z neutral resonance, the beauty signals, and B lifetime measurements. The width gamma(sub b anti-b) and the asymmetry A(sub b anti-b)(sup fb) for the decay process Z neutral to b anti-b are calculated. The average mixing parameter chi of the b quark is determined. Evidence for B(sub s), lambda(sub b), and J/psi production in Z neutral decays is shown. Measurements of the average b lifetime and the lifetimes for charged and neutral B hadrons are presented. ESA

N94-25474 International Centre for Theoretical Physics, Trieste (Italy).

A QUARK STRUCTURE OF HADRONS AND NUCLEI

S. Chakrabarty and S. Deoghuria Aug. 1992 107 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(DE93-616872; IC-92/201) Avail: CASI HC A06 (US Sales Only)

In this review we look into the recent understanding of mesons, baryons, and nuclei as a few quark bound states within the framework of quantum chromodynamics (QCD). In particular, we have reviewed our understanding of the nature of confining interaction, the spin-dependence of color forces, and the role of non-perturbative effects in the study of quark forces in the potential model approach. We also give a comparative study of results obtained by several potential models with reference to the experimental data. We find that although the Lorentz nature of confinement and the nature of spin-dependent color forces have been better understood now, only a partial understanding of these problems are obtained so far. Our study reveals that properties of baryons could be explained by the same potential model which successfully describe the mesons. However, the nuclei require chiral symmetry and non-perturbative methods for their description. We also discuss the relation between constituent, current and dynamical quark masses. We conclude that QCD motivated approaches have shown much success in explaining many results on hadronic and nuclear data. DOE

ON THE HADRON FORMATION TIME IN PION-NUCLEUS INTERACTION

L. V. Bravina, V. L. Korotkikh, L. I. Sarycheva, and S. Yu. Sivoklokov 1992 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality

(DE93-616879; INP-MSU-91-45-249) Avail: CASI HC A03 (US Sales Only)

Differences in the observable characteristics of pion-nucleus interactions at high energy are investigated for two definitions of the hadron formation time. The Monte Carlo simulation of hadron-nucleus interactions and quark-gluon string model for hadron-hadron collisions are used. It is shown that the momentum spectrum of the protons in the target fragmentation region is most sensitive to the definition of the formation time. The inclusive meson and meson resonance spectra are similar in the both versions. DOE

EXPERIMENTAL CHARACTERIZATION OF THE AFIT NEUTRON FACILITY M.S. Thesis

Oscar J. Lessard Sep. 1993 114 p

(AD-A273822; AFIT/GAP/ENP/93D-06) Avail: CASI HC A06/MF A02

AFIT's Neutron Facility was characterized for room-return neutrons using a Cf-252 source and a Bonner sphere spectrometer with three experimental models: the shadow shield; the Eisenhauer, Schwartz, and Johnson (ESJ); and the polynomial models. The free-field fluences at one meter from the ESJ and polynomial models were compared to the equivalent value from the accepted experimental shadow shield model to determine the suitability of the models in the AFIT facility. The polynomial model behaved erratically, as expected, while the ESJ model compared to within 4.8% of the shadow shield model results for the four Bonner sphere calibration. The ratio of total fluence to free-field fluence at one meter for the ESJ model was then compared to the equivalent ratio obtained by a Monte Carlo Neutron-Photon transport code (MCNP), an accepted computational model. The ESJ model compared to within 6.2% of the MCNP results. AFIT's fluence ratios were compared to equivalent ratios reported by three other neutron facilities which verified that AFIT's results fit previously published trends based on room volumes. The ESJ model appeared adequate for health physics applications and was chosen for calibration of the AFIT facility. DTIC

CRRES MICROELECTRONICS PACKAGE FLIGHT DATA ANALYSIS
E. G. Stassinopoulos, G. J. Brucker (Radiation Effects Consultants, West Long Branch, NJ.), and C. A. Stauffer (Systems Engineering and Security, Inc., Greenbelt, MD.) Washington Jun. 1993 72 p Sponsored in part by DNA
(RTOP 900-00-00)
(NASA-TP-3423; Rept-94B00007; NAS 1.60:3423) Avail: CASI HC A04/MF A01

A detailed in-depth analysis was performed on the data from some of the CRRES MEP (Microelectronics Package) devices. These space flight measurements covered a period of about fourteen months of mission lifetime. Several types of invalid data were identified and corrections were made. Other problems were noted and adjustments applied, as necessary. Particularly important and surprising were observations of abnormal device behavior in many parts that could neither be explained nor correlated to causative events. Also, contrary to prevailing theory, proton effects appeared to be far more significant and numerous than cosmic ray effects. Another unexpected result was the realization that only nine out of thirty-two p-MOS dosimeters on the MEP indicated a valid operation. Comments, conclusions, and recommendations are given. Author

At present no adequate computer code exists for predicting the effects of thermal nonequilibrium on the flow quality of a converging-diverging N2 nozzle. It is the purpose of this research to develop such a code and then perform parametric studies to determine the effects of intermolecular forces (high gas pressure) and thermal nonequilibrium (the splitting of temperature into a vibrational and rotational-translational excitation) upon the flow quality. The two models to be compared are given. Appendix A contains nomenclature and additional relationships. Author (revised)

The multi-ion, multi-event study of ion cyclotron resonance heating has been funded to study ion energization through ion cyclotron resonance with low frequency broadband electromagnetic turbulence. The modeling algorithm for the ion cyclotron resonance heating (ICRH) of oxygen ions was presented in Crew et al. (1990). Crew and his co-authors developed a two-parameter representation of selected oxygen conic distributions and modelled the conic formation in terms of resonance heating. The first year of this study seeks to extend the work of Crew and his co-authors by testing the applicability of the ICRH mechanism to helium ion conic distributions, using data obtained from the Energetic Ion Composition Spectrometer and the Plasma Wave Instrument on Dynamics Explorer 1. OPTICAL MODEL ANALYSES OF GALACTIC COSMIC RAY FRAGMENTATION IN HYDROGEN TARGETS
Lawrence W. Townsend Dec. 1993 13 p
(RTOP 199-45-16-11)
(NASA-TP-3404; L-17306; NAS 1.60:3404) Avail: CASI HC A03/MF A01

Quantum-mechanical optical model methods for calculating cross sections for the fragmentation of galactic cosmic ray nuclei by hydrogen targets are presented. The fragmentation cross sections are calculated with an abrasion-ablation collision formalism. Elemental and isotopic cross sections are estimated and compared with measured values for neon, sulfur, and calcium ions at incident energies between 400A MeV and 910A MeV. Good agreement between theory and experiment is obtained. Author

STRONG INTERACTIONS STUDIES WITH MEDIUM ENERGY PROBES Progress Report, 1 Dec. 1992 - 30 Nov. 1993
Kamal K. Seth Oct. 1993 19 p
(Contract DE-FG02-87ER-40344)
(DE94-001446; DOE/ER-40344/7) Avail: CASI HC A03/MF A01

This progress report refers to the period Aug. 1992 to Aug. 1993, which includes the first year of the three-year period 1 Dec. 1992 - 30 Nov. 1995 of the existing research contract. As anticipated in the 1992-1995 proposal, the major preoccupation during 1992-1993 was with Fermilab experiment E760. This experiment, whose primary objective is to make very high-resolution study of Charmonium Spectroscopy via proton-antiproton annihilations, has turned out to be a veritable gold-mine of exciting hadronic physics in other areas as well. These include the proton form factor in the time-life region, proton-antiproton forward scattering, QCD scaling laws, and light quark spectroscopy. A large fraction of the data from E760 was analyzed during this year, and several papers were published. In addition to the E760 experiment at Fermilab, continued progress was made in nuclear physics-related experiments at LAMPF, MIT, and NIKHEF, and their results were prepared for publication. Topics include high-resolution electron scattering, quasi-free electron scattering, and low-energy pion double charge exchange. DOE

An optical model description, based on multiple scattering theory, of longitudinal momentum loss in proton-nucleus and nucleus-nucleus collisions is presented. The crucial role of the imaginary component of the nucleon-nucleon transition matrix in accounting for longitudinal momentum transfer is demonstrated. Results obtained with this model are compared with Intranuclear Cascade (INC) calculations, as well as with predictions from Vlasov-Uehling-Uhlenbeck (VUU) and quantum molecular dynamics (QMD) simulations. Comparisons are also made with experimental data where available. These indicate that the present model is adequate to account for longitudinal momentum transfer in both proton-nucleus and nucleus-nucleus collisions over a wide range of energies. Author (revised)

(Contract DE-AC05-84ER-40150)
(CEBAF-PR-93-032) Avail: CASI HC A01/MF A01

The CEBAF beam can burn through the vacuum wall in approximately 100 microseconds. The authors have developed an inexpensive beam loss sensor that will unambiguously detect a true beam loss and shut off the beam within this time without tripping on moderate interference from other sources. They have incorporated a full system test into the system, with provision for direct replacement of faulty sensors without adjustment. This paper describes the sensors, the signal processing design, system test results, and characterization procedures. Author (revised)

THE DATA-ACQUISITION AND SECOND LEVEL TRIGGER SYSTEM FOR ZEUS CALORIMETER Ph.D. Thesis
Hermen Jasper vanderLugt 1993 159 p Sponsored by Stichting voor Fundamenteel Onderzoek der Materie, Netherlands Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-94-95384) Avail: Issuing Activity (European Space Agency (ESA))

The electron-proton collider HERA (German acronym for hadron electron storage ring) at DESY (German electron synchrotron) has successfully produced the first collisions between 26.6 GeV electrons and 820 GeV protons. The electron-proton collisions are studied by two experiments located at two of the four possible interaction points. These detectors are called H1 and ZEUS. The main contribution to the ZEUS experiment, the data acquisition of the ZEUS calorimeter, and the way in which the calorimeter information is used by the second level of the ZEUS trigger system are described. Details of the calorimeter data acquisition and the calorimeter second level trigger are given. The general performance of the calorimeter data acquisition system is presented. ESA

(DE93-616869; INP-MSU-91-42-236) Avail: CASI HC A03 (US Sales Only)

Within the framework of the multiple scattering model of nucleus-nucleus collision, the normalized factorial moments of q particle are calculated and the behavior of the anomalous fractal dimensions d(sub q) are analyzed. If any collective effects are absent for central collisions of heavy nuclei, all d(sub q) vanish and no possibility to discriminate the effects of multiple scattering in nuclei, the first order phase transition and self-similar cascade mechanism of particle production in intranuclei subprocesses. Existence of a q dependence of d(sub q) for central collisions of heavy nuclei can be a signature of particle production processes like the second order phase transition. DOE

THERMOELECTRIC COOLED, PURGE-AND-TRAP DEVICE FOR ENHANCING THE UTILITY OF FIBER OPTIC VOC SENSORS
E. A. Mizusawa, P. F. Daley, K. R. Kyle, K. C. Langry, and S. M. Angel Aug. 1993 11 p Presented at the Society of Photo-Optical Instrumentation Engineer's (SPIE) International Symposium on Optical Tools for Manufacturing and Advanced Automation, Boston, MA, 7-10 Sep. 1993
(Contract W-7405-eng-48)
(DE94-001772; UCRL-JC-115005; CONF-9309199-10) Avail: CASI HC A03/MF A01

A thermoelectric cooled, purge-and trap device (TEC) has been developed to enhance the utility of fiber optic VOC sensors. This simple device consists of a thin copper radiator which is sandwiched between two thermoelectric coolers. Two water-cooled, copper heat sinks are used to maintain the hot side surfaces of the thermoelectric coolers at 5 C, allowing internal surface temperatures of the radiator to be controlled between 5 C to -43 C. This paper describes the use of the TEC with a reversible, fiber optic, carbon tetrachloride sensor. The sensor by itself has a detection limit of around 1,000 ppmv carbon tetrachloride in nitrogen. When the sensor is used with the TEC, vapor phase concentrations down to 100 ppmv can be measured. DOE

(DE93-019940; UCRL-JC-114493; CONF-930722-34) Avail: CASI HC A03/MF A01

Much progress has been made recently in characterizing the emission from neon-like Yttrium exploding foil x ray lasers at Lawrence Livermore National Laboratory. Concomitant with that effort, detailed modeling to enhance our understanding of the experiments and improve their design was carried out. Our modeling includes target hydrodynamics, calculation of gain, and both ray and wave optics propagation. Our modeling of Yt x ray lasers, including first simulations using a two transverse dimensional gain calculation, are described. Our calculations indicate that the time-integrated signal is very sensitive to the time history of the gain, because of the rapid sweep of the beam in angle measured with respect to the plane of the foil. It was found that better agreement with experiment is achieved if the falloff of the gain with time is made slightly faster than our codes predict. In the vertical direction (normal to exploding foil direction), the experimental beam pattern is typically broader than calculated. It was found that ray and wave optics calculations are in good agreement. The coherence length obtained by a wave optics calculation is larger than seen in experiments; this is probably due to fluctuations and/or the smooth variation of the pump laser line focus. Possible improvements to our modeling which would include such nonideal effects are discussed. DOE

FIBER OPTIC DETECTION OF LASER GENERATED ULTRASOUND FOR MATERIALS CHARACTERIZATION M.S. Thesis
Andrew Michael Davis 1993 185 p
(ISBN-0-315-83541-9; CTN-94-60946) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A fiber optic Michelson interferometer with an active homodyne demodulation system was used to detect ultrasound generated by a Q-switched Nd-YAG laser. The sensing arm of the interferometer was adhered to or embedded in the materials under investigation. Insonification occurred at either the surface or inside the test specimen. In-situ generation was accomplished using an embedded fiber optic delivery system. The ultrasonic transients so generated and detected were used to determine the velocity of certain bulk wave modes propagating in specimens of aluminum, epoxy, and graphite epoxy laminates. The experimentally determined velocities are reported and compared to those in the literature. Ultrasonic velocity is related to or is an indicator of a number of material properties and hence is a very useful parameter for materials characterization. Author (CISTI)

The development and empirical validation of an optical instrument for the operational measurement of visual conspicuity of objects are discussed. The instrument measures visual conspicuity by assessing two parameters in combination. The first is eccentricity: how far aside the object can we look before we reach the point where it cannot any more be discriminated from the other details in the visual field. The second is sector contrast reduction: how much should we reduce sector contrast (defined as the ratio of object luminance and average luminance across the whole sector of the visual field of the instrument) to reach the point where the object cannot be discriminated any more. Experiments show that the meter yields a valid visual conspicuity index, at least in principle. It is suggested how the detected deficiencies of the instrument could be remedied, and how it could be made simpler and more user friendly. ESA

Nonlinear optical (NLO) materials are becoming increasingly important to the Air Force, and their expanding use in future systems is inevitable. Applications ranging from communications and optical computing to lasers and laser hardening will all be affected by the development of these materials. Because of this need, basic research and development of these materials are extremely important. Within the Materials Directorate of Wright Laboratory, the Electronic and Optical Materials Branch is performing basic R&D in various areas of nonlinear optical materials. Central to this research is the measurement of the optical properties of these materials. In order to apply these materials to device and systems, it is important to understand how they behave under the influence of various forces and conditions. These include applied voltages and currents, incident electromagnetic radiation and temperature changes. How they behave under these various conditions can be either useful or detrimental depending on the application. In the case of optical transmission, changes in material properties due to applied voltage are useful for applications where modulation is important. DTIC

NOVEL FRINGE SCANNING/FOURIER TRANSFORM METHOD OF SYNTHETIC IMAGING
T. M. Crawford and R. K. Albano 1993 8 p Presented at the Annual Meeting of the Society of Photo-Optical Instrumentation Engineers (SPIE), San Diego, CA, 11-16 Jul. 1993
(Contract DE-AC07-76ID-01570)
(DE93-018936; EGG-M-93041; CONF-930722-43) Avail: CASI HC A02/MF A01

We have developed a one-dimensional theory and a computer model for synthetically imaging scenes using a novel fringe scanning/Fourier transform technique. Our method probes a scene using two interfering beams of slightly different frequency. These beams form a moving fringe pattern which scans the scene and resonates with any spatial frequency components having the same spatial frequency as the scanning fringe pattern. A simple, non-imaging detector above the scene observes any scattered radiation from the scene falling onto it. If a resonance occurs between the scanning fringe pattern and the scene, then the scattered radiation will be modulated at the difference frequency between the two probing beams. By changing the spatial period of the fringe pattern and then measuring the amplitude and phase of the modulated radiation that is scattered from the scene, the Fourier amplitudes and phases of the different spatial frequency components making up the scene can be measured. A synthetic image of the scene being probed can be generated from this Fourier amplitude and phase data by taking the inverse Fourier transform of this information. This technique could be used to image objects using light, ultrasonic, or other electromagnetic or acoustic waves. DOE

DESIGN REFINEMENT OF MULTILAYER OPTICAL THIN FILM DEVICES WITH TWO OPTIMIZATION TECHNIQUES
K. V. S. R. Apparao (Bhabha Atomic Research Centre, Bombay, India.) 1992 29 p
(DE93-634228; BARC-1992/E/042) Avail: CASI HC A03/MF A01 (US Sales Only)

The design efficiency of two different optimization techniques for designing multilayer optical thin film devices is compared. Ten different devices of varying complexities are chosen as design examples for the comparison. The design refinement efficiency and the design parameter characteristics of all the sample designs obtained with the two techniques are compared. The results of the comparison demonstrate that the new method of design developed using damped least squares technique with indirect derivatives give superior and efficient designs compared to the method developed with direct derivatives. DOE

AN OPTICAL ASK AND FSK PHASE DIVERSITY TRANSMISSION SYSTEM
H. vandenBoom, W. vanEtten, W. H. C. deKrom, P. vanBennekom, F. Huijskens, L. Niessen, and F. deLeijer Dec. 1992 101 p
(EUT-92-E-268; ISBN-9-06-144268-0; ETN-94-94775) Avail: CASI HC A06/MF A02

The results of a contribution to an electrooptical project for a 'phase diversity system', covering ASK and FSK (Amplitude and Frequency Shift Keying), are described. Specifications of subsystems, and tolerances and consequences of these tolerances for the final system performance, were derived. For the optical network of the phase diversity receiver, a manufacturing set up for three by three fused biconical taper fiber couplers was developed. In order to characterize planar optical networks, a set up was constructed to measure the phase relations at 1523 nm. The optical frequency of the local oscillator laser has to be locked on to the frequency of the received optical signal. This locking circuit is described. A complete optical three by three phase diversity transmission system was developed that can be used as a testbed for subsystems. The sensitivity of the receiver at a bit error rate of 10 to the minus 9th power is -47.2 dBm, which is 4.2 dB better than the value of the specifications. ESA

PHOTO-INDUCED AND ELECTROOPTIC PROPERTIES OF (Pb,La)(Zr,Ti)O3 FILMS FOR OPTICAL MEMORIES
D. Dimos, B. G. Potter, M. B. Sinclair, B. A. Tuttle, and W. L. Warren 1993 12 p Presented at the International Symposium on Integrated Ferroelectrics, Colorado Springs, CO, 19-21 Apr. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC04-76DP-00789)
(DE93-019820; SAND-93-0547C; CONF-9304197-2) Avail: CASI HC A03

Photo-induced hysteresis changes and electro-optic effects in sol-gel Pb(Zr,Ti)03 (PZT) and PLZT films have been studied in an effort to evaluate these materials for optical memory applications. The films exhibit two types of photo-induced changes in their hysteresis behavior which are suitable for optical storage. Both types of photo-induced hysteresis changes are due to trapping of photo-generated charge carriers at sites which minimize internal depolarizing fields. The photo-induced changes are reproducible and stable, which indicates that the charge traps are stable. However, improvements in photosensitivity will be required to develop a competitive technology for optical memories. In addition, polarization-dependent changes in the refractive indices can be the basis of a nondestructive optical readout technique. The index changes of films have been determined using a waveguide refractometry technique, which allows the extraordinary and ordinary index changes to be obtained independently. DOE

OUTPUT OPTICS FOR LASER VELOCIMETERS Patent

Dana H. Lynch, inventor (to NASA), William D. Gunter, inventor (to NASA), and Kenneth W. McAlister, inventor (to NASA) 23 Nov. 1993 5 p Filed 17 Apr. 1991
(NASA-Case-ARC-11889-1-SB; US-Patent-5,264,907; US-Patent-Appl-SN-691602; US-Patent-Class-356-28.5; US-Patent-Class-359-362; Int-Patent-Class-G01P-3/36) Avail: US Patent and Trademark Office

Space savings are effected in the optical output system of a laser velocimeter. The output system is comprised of pairs of optical fibers having output ends from which a beam of laser light emerges, a transfer lens for each light beam, and at least one final (LV) lens for receiving the light passing through the transfer lenses and for focussing that light at a common crossing point or area. In order to closely couple the transfer lenses to the final lens, each transfer lens is positioned relative to the final lens receiving light therefrom such that the output waist of the corresponding beam received by the final lens from the transfer lens is a virtual waist located before the transfer lens.

SURFACE MODIFICATION OF SAPPHIRE FOR ENHANCED INFRARED WINDOW PERFORMANCE

C. J. McHargue (Tennessee Univ., Knoxville.), D. L. Joslin (Tennessee Univ., Knoxville.), J. M. Williams, and M. E. OHern (Nano Instruments, Inc., Knoxville, TN.) 1993 4 p Presented at the International Union of Materials Research Societies on Advanced Materials, Tokyo, Japan, 31 Aug. - 4 Sep. 1993
(Contract DE-AC05-84OR-21400)
(DE94-000333; CONF-9308122-7) Avail: CASI HC A01/MF A01

Two ion implantation conditions were evaluated for improving the mechanical performance of sapphire IR window material. Both increased the average strength as measured by 4-point bend tests and were effective in preventing the propagation of surface flaws. Ion implantation that produced a damaged crystalline surface improved the reliability at lower stresses more than the implantation that produced an amorphous surface. Neither process significantly affected the IR transmission. DOE

FIBER OPTIC TEMPERATURE SENSOR USING A Y2O2S:Eu THERMOGRAPHIC PHOSPHOR

Todd V. Smith (Bethel Coll., Saint Paul, MN.) and D. Barton Smith 1993 8 p Presented at the Society of Photo-Optical Instrumentation Engineer's International Symposium on Optical Tools for Manufacturing and Advanced Automation, Boston, MA, 7-10 Sep. 1993
(Contract DE-AC05-84OR-21400)
(DE94-000331; CONF-9309199-5) Avail: CASI HC A02/MF A01

This report details the development and testing of a thermographic-phosphor-based fiber-optic temperature sensor. The sensor is constructed by removing a region of the fiber jacket and cladding, then coating the exposed core with yttrium oxysulfide doped with a europium activator (Y2O2S:Eu). When photoexcited, the europium in the host lattice emits a sharp-line fluorescence spectrum that is characteristic of the temperature of the host crystal lattice. By measuring fluorescence lifetimes, we can deduce the temperature of an optical fiber that is in thermal contact with the fiber. Two different distributions of Y2O2S:Eu in the cladding region were evaluated with regard to light coupling efficiency. Theoretical waveguide calculations indicate that a thin core/cladding boundary distribution of Y2O2S:Eu couples light more efficiently into the cores guided modes than does a bulk distribution of phosphor in the cladding. The sensor tests showed reproducible response from 20 to 180 Celsius. This technique has several advantages over other fiber optic temperature sensing techniques: the temperature measurement is independent of the strain applied to the fiber; the measurements are potentially accurate to within half a degree centigrade; the sensor allows temperature to be measured at precise locations; and the method does not preclude the use of the fiber for the simultaneous measurement of other parameters. DOE

THEORETICAL INVESTIGATION OF VARIABLE PERIODICITY (GRADED) MULTILAYERS FOR HARD X RAY APPLICATIONS Final Report

Ralph A. Kinney 20 Jan. 1994 66 p
(NASA Order H-13034-D)
(NASA-CR-194824; NAS 1.26:194824) Avail: CASI HC A04/MF A01

The objective of this research was to investigate the possibility of increasing the useful bandwidth of multilayer mirrors. Mirrors 'constructed' with non-periodically spaced reflecting surfaces were considered. These structures included depth-graded and laterally-graded mirrors as well as those with reflectors located via a log-periodic spacing rule. No enhancement of bandwidth resulted from simulations of simple versions of any of the three non-periodic mirrors. However, certain depth-graded structures did exhibit reflectances essentially the same as from uniform mirrors. Moreover, it was found that some control was possible regarding the location (with respect to energy) of the maximum reflectance peak. Effective bandwidth was increased when composite models were simulated. In two of the cases studied, bandwidth was enhanced by a factor of approximately 3. One model consisted of a depth-graded mirror constructed with three separately defined structures, or blocks. Each block consisted of two layer-pairs repeated three times. Then, the entire 18 layer-pair group was repeated several times. Simulation of this 3 block depth-graded configuration yielded three reflectance peaks, one representative of each depth-graded block. The other configurations resulting in enhanced bandwidth assumed independently constructed mirrors immediately adjacent to each other and sharing the same substrate. Reflectance peaks from each mirror appeared in the response. Both basic models show greatly enhanced effective bandwidths even though the reflectance curves appear as non-overlapping for these specific models. Additionally, these configurations are realizable. Details are contained in the section, DESIGN SIMULATIONS. Author

SPATIOTEMPORAL BEHAVIOR AND NONLINEAR DYNAMICS IN A PHASE CONJUGATE RESONATOR

Siuying Raymond Liu Dec. 1993 225 p
(Grant NAG1-1363; RTOP 233-03-01-01)
(NASA-CR-4567; NAS 1.26:4567) Avail: CASI HC A10/MF A03

The work described can be divided into two parts. The first part is an investigation of the transient behavior and stability property of a phase conjugate resonator (PCR) below threshold. The second part is an experimental and theoretical study of the PCR's spatiotemporal dynamics above threshold. The time-dependent coupled wave equations for four-wave mixing (FWM) in a photorefractive crystal, with two distinct interaction regions caused by feedback from an ordinary mirror, was used to model the transient dynamics of a PCR below threshold. The conditions for self-oscillation were determined and the solutions were used to define the PCR's transfer function and analyze its stability. Experimental results for the buildup and decay times confirmed qualitatively the predicted behavior. Experiments were carried out above threshold to study the spatiotemporal dynamics of the PCR as a function of Pragg detuning and the resonator's

Fresnel number. The existence of optical vortices in the wavefront were identified by optical interferometry. It was possible to describe the transverse dynamics and the spatiotemporal instabilities by modeling the three-dimensional-coupled wave equations in photorefractive FWM using a truncated modal expansion approach. MUELLER MATRIX ANALYSIS OF INFRARED ELLIPSOMETRY
E. Wold and J. Bremer (Norges Tekniske Hoegskole, Trondheim.) 2 Feb. 1993 31 p See also PB92-102896 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-201549; STF19-A93003) Avail: Issuing Activity (National Technical Information Service (NTIS))

A Mueller analysis has been made of IR ellipsometry performed with imperfect optical components. Equations linking together experimental and calculated Fourier coefficients have been derived and consistently solved. Correction routines for permittivity measurements are demonstrated and discussed with Au and SrTiO3 as examples. It is shown that such effects as interferometer polarization, detector dichroism, transmission and phase-changes in polarizers can be effectively removed from the spectra. The problems of calibration and multiple reflections between IR polarizers are discussed and error propagation in permittivity measurements is analyzed. NTIS

Mechanical deformations induced by stretching optical fibers and epoxy-carbon laminates with embedded optical fibers were studied with fiber optic measurement technology: intensity measurements, reflectometry, and interferometry. The results from the measurements were compared in order to judge which method could be further developed for strain measurement in a laboratory. The conclusion is that the interferometry can be developed into a laboratory method for measuring deformations in carbon laminates. NTIS

ANALYSIS FOR THE COMPUTATIONAL MODELING OF FINITE CLADDING AND LOSSY COATING EFFECTS IN FIBERS
R. M. Bertrand 1993 40 p
(PB94-111085; ET/EM-1993-12) Copyright Avail: CASI HC A03/MF A01

In recent papers, an unknown phenomenon is reported concerning fibers operating near the cutoff frequency. This phenomenon is the existence of anomalous oscillations, appearing when fibers are optimized in order to enlarge the transmission capacity, and was not predicted by theory. A possible explanation takes the influence of the cladding into account, and predicts interactions between fundamental modes and cladding modes which may occur when the field in the fiber - operating near cutoff - extends into the cladding. As 'classical' programs (made with the assumption of the infinite cladding) can not calculate the cladding modes, a new program had to be developed for use at PTT Research Neher Laboratory, taking not only the finite cladding, but also the lossy coating into account. A method that uses the numerical stable scattering-matrix formalism is presented. With this method, two recursive scattering relations are arrived at for implementation in the new program. The two above mentioned relations were used for the implementation, but the resulting program did not work well because of numerical problems. Some recommendations to solve the problems are given in the last chapter, the most important one being the possibility to use another set of Bessel functions for the implementation of the two derived recursive relations. [MEASURING ELECTRICALLY CHARGED PARTICLE FLUXES IN SPACE USING A FIBER OPTIC LOOP SENSOR] Final Report
Jul. 1992 23 p
(Contract NAS5-30883; SBIR-08.13-7670)
(NASA-CR-191328; NAS 1.26:191328) Avail: CASI HC A03/MF A01

The purpose of this program was to demonstrate the potential of a fiber optic loop sensor for the measurement of electrically charged particle fluxes in space. The key elements of the sensor are a multiple turn loop of low birefringence, single mode fiber, with a laser diode light source, and a low noise optical receiver. The optical receiver is designed to be shot noise limited, with this being the limiting sensitivity factor for the sensor. The sensing element is the fiber optic loop. Under a magnetic field from an electric current flowing along the axis of the loop, there is a non-vanishing line integral along the fiber optic loop. This causes a net birefringence producing two states of polarization whose phase difference is correlated to magnetic field strength and thus, current in the optical receiver electronic processing. The objectives in this program were to develop a prototype laser diode powered fiber optic sensor. The performance specification of a minimum detectable current density of 1 (mu)amp/sq m-(radical)Hz, should be at the shot noise limit of the detection electronics. OPTRA has successfully built and tested a 3.2 m diameter loop with 137 turns of low birefringence optical fiber and achieved a minimum detectable current density of 5.4 x 10(exp-5) amps/(radical)Hz. If laboratory space considerations were not an issue, with the length of optical fiber available to us, we would have achieved a minimum detectable current density of 4 x 10(exp -7) amps/(radical)Hz. FIBER OPTIC DETECTION OF ULTRASOUND AND ITS APPLICATION TO CURE MONITORING M.S. Thesis
Myo Myint Ohn 1992 152 p
(ISBN-0-315-83424-2; CTN-94-60956) Copyright Avail: Micromedia Ltd., Technical Information Centre, 240 Catherine Street, Suite 305, Ottawa, Ontario, K2P 2G8, Canada HC/MF

A fiber optic Michelson sensor with an active homodyne demodulation scheme used for detection of high frequency elastic waves is presented. A comparative analysis was attempted by quantitatively studying the fiber sensor response and open beam interferometer response to ultrasonic pulses. This technique of embedded and surface bonded fiber optic detection was extended for the purpose of materials characterization. By combining the interrogative nature of ultrasound and the in-situ sensing capabilities of optical fibers, a hybrid technique of monitoring the cure of epoxies and epoxy matrix composites (graphite epoxy) is reported. Using this fiber optic and ultrasonic approach to cure monitoring, a parameter exhibiting a similar inverse trend to the viscosity of the epoxy is proposed. Author (CISTI)

Conventional infrared scanners used to detect targets cannot distinguish between insignificant objects, such as birds, at a relatively close distance and significant objects such as aircraft at a greater distance, which leads to false alarms. A scanner is disclosed which makes it possible to distinguish between relatively close objects from which radiation is emitted and objects at a greater distance which subtend a similar solid angle. The scanner of the invention does this by suppressing signals whose amplitude is a function of the scanned azimuth or elevation shows a relatively great extension compared with signals that show a relatively small extension. The invention comprises at least one sensor unit, including at least one focusing means arranged to focus rays from the objects to be detected to at least one corresponding focal plane. At least one radiation sensitive detector is positioned in the focal plane and arranged to emit signals corresponding to the incoming radiation. The device is arranged to scan an angular field in azimuth and/or elevation, and has a signal evaluation unit which selects targets and suppresses certain signals as indicated above. CISTI

GERMANIUM X RAY PHASE PLATES FOR THE PRODUCTION OF CIRCULARLY POLARIZED X RAYS
C. J. Yahnke, G. Srajer, D. R. Haeffner, D. M. Mills, and L. Assoufid Oct. 1993 15 p Presented at the Synchrotron Radiation Instrumentation, Gaithersburg, MD, 23-26 Aug. 1993 Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contract W-31-109-eng-38)
(DE94-002908; ANL/XFD/CP-81131; CONF-930824-20) Avail: Issuing Activity (Department of Energy (DOE))

The authors have constructed an x-ray phase plate to produce both linearly and circularly polarized x-rays at discrete energies between 20 keV and 88 keV. The plate is a monolithic two-crystal design, constructed from germanium, which increases the resultant degree of circular polarization of the output beam. They have measured the degree of circular polarization at 65 keV to be 90% +/- 4%, significantly better than that produced by silicon phase plates. This radiation was used to measure the magnetic Compton profile for Fe, which was found to be in good agreement with theory and previous work. The underlying x-ray optics and the characterization of the device between 62 keV and 93 keV at the Cornell High Energy Synchrotron Source are presented. DOE

The feasibility of a white-light, pressure and temperature interferopolarimetric sensor using optical fibers was established through doctoral research and granted a CNRS (National Center for Scientific Research) patent. The proposed study involved eliminating the discrete optical components (polarizers, analyzers, coupling optics) initially used. The author also miniaturized the sensor, analyzed the propagation of waves in the device's different birefringent fibers, and studied the behavior of those optical fibers under varying temperatures and pressures. The results are presented in the report. NTIS

INVESTIGATE ZERO-STRESS REPLICATED OPTICS Final Report, Nov. 1992 - Aug. 1993
Darell Engelhaupt and Robert Rood 1993 45 p
(Contract NAS8-38609)
(NASA-CR-193889; NAS 1.26:193889; UAH-5-33127) Avail: CASI HC A03/MF A01

The contracted activities for the procurement of 'Investigate Zero-Stress Replicated Optics' to support the AXAF-S x-ray spectrometer mirrors has been completed. To date four large Wolter I grazing incidence x-ray optical shells have been electroformed from nickel. The mirrors were fabricated utilizing each of two nickel alloy plated aluminum substrates twice. A wide variety of testing has been completed by NASA MSFC and UAH. This testing includes heat treatment control tests, subscale plating and fixture testing, alloy control of the electroless nickel, adhesion and release testing of the gold to electroless nickel, electroforming instrumentation and software and fabrication of subscale models. The full scale shells are one millimeter thick nickel electrodeposited over a thin gold layer which in turn has the optical surface on the inside. The optical surface is the replicate of the surface prepared on the substrate. Appendix I briefly outlines the fabrication process. Major objectives which were shared by UAH and MSFC include the design of facilities, equipment and tooling and procurement of materials and equipment. Process development followed with the fabrication of small scale pilot units. Procurement commenced immediately and equipment and materials were ordered to implement the fabrication of first surface full scale substrates (mandrels) and the second surface electroformed optical components. All principal objectives have been achieved. Inspection of the mirrors in visible and x-ray modes validates that the required performance and the quality can be achieved by an electroforming replication process. A very distinct progressive improvement has been achieved with each of the four mirrors produced. The final mirror exceeded the original goals and set an improved standard for flight hardware. The future goal of a 30 arc second resolution at 8 KEV x-ray appears to be achievable by this process when proper cleanliness and process control is utilized. Derived from text

HETERODYNE ARRAY FOR MEASUREMENT OF TARGET VELOCITY Patent
Marc D. Mermelstein, inventor (to Navy) 3 Aug. 1993 15 p Filed 30 Jun. 1992
(AD-D016025; US-Patent-5,233,403; US-Patent-Appl-SN-906649; US-Patent-Class-356-28.5) Avail: US Patent and Trademark Office

A system for determining the angular velocity of a mobile target relative to a station is described. The system develops first and second reference beams and a beam to the target to enable the target to generate first and second signals. Optical devices preferably fiber-optical devices, responsive to the first and second reference beams and to the first and second signals respectively received from the target at discrete first and second positions on the station, respectively produce first and second interference pattern signals. Each of said received signals has a Doppler shift as a function of the movement of the target. An electrical processing circuit then processes the interference pattern signals to develop a signal indicative of the target's angular velocity. DTIC

HYPERSPECTRAL IMAGERY CLASSIFICATION USING A BACKPROPAGATION NEURAL NETWORK Scientific Paper
Pi-Fuay Chen and Tho C. Tran Dec. 1993 7 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A273615; TEC-R-199) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

A backpropagation neural network was developed and implemented for classifying AVIRIS (Airborne Visible/Infrared Imaging Spectrometer) hyperspectral imagery. It is a fully interconnected linkage of three layers of neural network. Fifty input layer neurons take in signals from bands 41 to 90 of the AVIRIS spectral data in parallel. Test images are classified into four terrain categories of water, grassland, golf courses, and built-up areas using four output neurons. A hidden layer consisting of 12 neurons is

used. A training set containing 1,700 pixels for each of the four desired terrain categories is extracted and created from the first test image. Good classification accuracies of 81.8 percent to 95.5 percent are achieved despite the moderate AVIRIS pixel resolution of 20 meters by 20 meters.

(AD-A273625; ERIM-254400-1-P) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

In this report we outline a time-integrating hybrid-optical processor to perform the wavelet transform of two dimensional spatial or spectral data. This architecture partitions the optical/electronic workload for most general and efficient operation. This processor architecture is very general in that it allows a large class of analyzing wavelet kernels, does not require special encoding methods to accommodate the bipolar nature of the wavelet kernel, naturally accommodates the serial nature of sensor data readout, has the ability to be easily reprogrammed for different wavelet kernels, and makes most efficient use of wavelength, spatial, and temporal multiplexing for fast operation. The processor is based on a triple product processor architecture which uses acousto-optic modulators and laser diodes as a means of high throughput data insertion into the system. The architecture is not limited by requiring the use of two dimensional spatial light modulators and fixed masks which are the basis for many current wavelet processor concepts. We provide the result of a simulation of the optical processor to show its potential performance. DTIC

LOITA: LUNAR OPTICAL/INFRARED TELESCOPE ARRAY
Jun. 1993 166 p
(Contract NASw-4435)
(NASA-CR-195532; NAS 1.26:195532) Avail: CASI HC A08/MF A02

LOITA (Lunar Optical/Infrared Telescope Array) is a lunar-based interferometer composed of 18 alt-azimuth telescopes arranged in a circular geometry. This geometry results in excellent uv coverage and allows baselines up to 5 km long. The angular resolution will be 25 micro-arcsec at 500 nm and the main spectral range of the array will be 200 to 1100 nm. For infrared planet detection, the spectral range may be extended to nearly 10 mu m. The telescope mirrors have a Cassegrain configuration using a 1.75 m diameter primary mirror and a 0.24 m diameter secondary mirror. A three-stage (coarse, intermediate, and fine) optical delay system, controlled by laser metrology, is used to equalize path lengths from different telescopes to within a few wavelengths. All instruments and the fine delay system are located within the instrument room. Upon exiting the fine delay system, all beams enter the beam combiner and are then directed to the various scientific instruments and detectors. The array instrumentation will consist of CCD detectors optimized for both the visible and infrared as well as specially designed cameras and spectrographs. For direct planet detection, a beam combiner employing achromatic nulling interferometry will be used to reduce star light (by several orders of magnitude) while passing the planet light. A single telescope will be capable of autonomous operation. This telescope will be equipped with four instruments: wide field and planetary camera, faint object camera, high resolution spectrograph, and faint object spectrograph. These instruments will be housed beneath the telescope. The array pointing and control system is designed to meet the fine pointing requirement of one micro-arcsec stability and to allow precise tracking of celestial objects for up to 12 days. During the lunar night, the optics and the detectors will be passively cooled to 70-80 K temperature. To maintain a continuous communication with the earth a relay satellite placed at the L4 libration point will be used in conjunction with the Advanced Tracking and Data Relay Satellite System (ATDRSS). Electrical power of about 10 kW will be supplied by a nuclear reactor based on the SP-100 technology. LOITA will be constructed in three phases of six telescopes each. The total mass of the first operational phase is estimated at 58,820 kg. The cost of the fully operational first phase of the observatory is estimated at $8.9 billion. LOITA's primary objectives will be to detect and characterize planets around nearby stars (up to ten parsec away), study physics of collapsed stellar objects, solar/stellar surface features and the processes in nuclear regions of galaxies and quasars. An interferometric array such as LOITA will be capable of achieving resolutions three orders of magnitude greater than Hubble's design goal. LOITA will also be able to maintain higher signal to noise ratios than are currently attainable due to long observation times available on the moon.

SOFT X RAY OPTICS BY PULSED LASER DEPOSITION Status Report, 15 Aug. 1993 - 15 Feb. 1994
Felix E. Fernandez 1994 4 p
(Grant NAG5-2188)
(NASA-CR-195139; NAS 1.26:195139) Avail: CASI HC A01/MF A01

A series of molybdenum thin film depositions by PLD (Pulsed Laser Deposition) have been carried out, seeking appropriate conditions for multilayer fabrication. Green (532 nm) and UV (355 nm) light pulses, in a wide range of fluences, were used. Relatively large fluences (in comparison with Si) are required to cause evaporation of molybdenum. The optical penetration depths and reflectivities for Mo at these two wavelengths are comparable, which means that results should be, and do appear to be similar for equal fluences. For all fluences above threshold used, a large number of incandescent particles is ejected by the target (either a standard Mo sputtering target or a Mo sheet were tried), together with the plasma plume. Most of these particles are clearly seen to bounce off the substrate. The films were observed with light microscopy using Nomarski and darkfield techniques. There is no evidence of large debris. Smooth films plus micron-sized droplets are usually seen. The concentration of these droplets embedded in the film appears not to vary strongly with the laser fluence employed. Additional characterization with SEM and XRD is under way.

A STUDY ON ELECTROSTATIC QUADRUPOLE LENSES AND THEIR APPLICATION TECHNOLOGIES [YONKYOKUSHI RENZU TO SONO RIYO GIJUTSU NI KANSURU KENKYU]
Shigeo Okayama 26 Mar. 1993 166 p In JAPANESE
(Rept-948; JTN-94-80516) Avail: CASI HC A08/MF A02

A study was conducted to provide solutions to the problems which hinders the utilization of the quadrupole lens systems in place of the conventional round lenses. A new simplified lens capable of correcting third order aperture aberration is proposed. The results of the study are outlined as follows: (1) potential distribution and electron optical properties of electrostatic quadrupole lenses are accurately obtained, and focal properties of the quadrupole lenses for various electrode length are calculated using the modified bell shaped model; (2) focal properties of the electrostatic quadrupole lens are accurately obtained from accurate measurements of the shadow image of fine grids and the experimental results agree with those calculated; (3) a Quadrupole Electron-Beam Lithography System (QEBS) is proposed and high precision electrostatic quadrupole triplet has been developed for the system; and (4) the corrections of aperture aberration of quadrupole systems are presented, and a new simplified lens possessing the function of correction of the aperture aberration is proposed. A complete lens system consisting of four stage quadrupoles and five aperture electrodes is proposed as a 1:1 probe forming lens and as a corrector for rotationally symmetrical objective lens. CONFORMAL METHOD OF FABRICATING AND OPTICAL WAVEGUIDE ON A SEMICONDUCTOR SUBSTRATE Patent
Stephen D. Russell, inventor (to Navy) 24 Aug. 1993 7 p Filed 30 Apr. 1992
(AD-D015988; US-Patent-5,238,877; US-Patent-Appl-SN-876615; US-Patent-Class-437-231) Avail: US Patent and Trademark Office

A method for fabricating a conformal optical waveguide on a semiconductor substrate which results in an improved conformal processing method of producing ferroelectric ceramic waveguides that is integratable with conventional electronic and optoelectronic devices is described. First, a patterning of a desired waveguide configuration is made on desired semiconductor substrate. A conformal confinement layer is fabricated in the pattern of the desired waveguide configuration on the semiconductor substrate. The conformal confinement layer has an index of refraction. Next, the method calls for a placing of a sol-gel waveguide precursor in the conformal confinement layer. Next the spin casting of a sol-gel waveguide precursor shapes a sol-gel conformal waveguide layer in the conformal confinement layer on the semiconductor substrate. The annealing of the spin cast sol-gel conformal waveguide layer forms the conformal optical waveguide which has an index of refraction that is greater than the refractive index of the conformal confinement layer. SCANNING PROBE LITHOGRAPHY. 2: SELECTIVE CHEMICAL VAPOR DEPOSITION OF COPPER INTO SCANNING TUNNELING MICROSCOPE-DEFINED PATTERNS
Jonathan K. Schoer, Claudia B. Ross, Richard M. Crooks, Thomas S. Corbitt, and Mark J. Hampden-Smith 23 Nov. 1993 22 p
(Contract N00014-91-J-1991)
(AD-A273304; TR-12) Avail: CASI HC A03/MF A01

A scanning tunneling microscope (STM) has been used to define features having critical dimensions ranging from 0.05 to 5.0 micrometer within a self-assembled monolayer resist of octadecylmercaptan, HS(CH2)17CH3, confined to a Au (111) surface. Low temperature chemical vapor deposition (CVD) methods were used to metalize the STM-patterned surface with Cu. At substrate temperatures near 120 C, the Cu CVD precursor, hexafluoroacetyl acetonatocopper(I) - (1,5-cyclooctadiene), disproportionates to deposit Cu on the STM-etched portion of the substrate, but not on the unetched methyl-terminated monolayer resist surface. At substrate temperatures significantly above 120 C the degree of selectivity is reduced, probably as a result of thermal desorption of the organomercaptan monolayer. DTIC

SOLUTIONS OF THE 2-D HELMHOLTZ EQUATION FOR OPTICAL WAVEGUIDES
A. Sharma and P. Bindal (Indian Inst. of Tech., New Delhi.) Nov. 1992 30 p
(DE93-616840; LAMP-92/2) Avail: CASI HC A03/MF A01 (US Sales Only)

In both optical fibers and integrated optical devices, the basic phenomenon is that of waveguidance, and in order to effectively analyze and design these waveguides, it is necessary to understand the phenomenon of guidance through them. In the most basic form, this requires the solutions of Maxwell's equations for the boundary conditions represented by the waveguiding structure. Fortunately, for optical waveguides, in most cases of practical importance, it suffices to solve the much simpler Helmholtz equation. However, it is still difficult to solve this equation for those integrated optical structures which provide two-dimensional confinement to optical waves. In this case the Helmholtz equation is a partial differential equation and one has to use approximate and/or numerical techniques to obtain its solutions. The present report is concerned with some of such techniques developed recently. DOE

IMPROVEMENT OF SYSTEM PROPERTIES OF A PULSED LASER DOPPLER ANEMOMETER WITH RESPECT TO AN OPTICAL AMPLIFIER Ph.D. Thesis - Tech. Univ. Munich [VERBESSERUNG DER SYSTEMEIGENSCHAFTEN EINES GEPULSTEN LASER-DOPPLER-ANEMOMETERS UNTER BERUECKSICHTIGUNG EINES OPTISCHEN VERSTAERKERS]
Stephan Rahm May 1993 103 p In GERMAN
(DLR-FB-93-19; ETN-94-95203) Avail: CASI HC A06/MF A02

The use of an optical detector preamplifier in a pulsed laser Doppler system operating at the wavelength 10.6 micrometers is investigated. Especially the possibility of improvement of the SNR (Signal to Noise Ratio) from the whole lidar system was examined. Theoretically developed models were compared with experimental data. For this task an optical amplifier was developed from a pulsed CO2 laser. This amplifier was integrated in a Doppler lidar system. With this system, measurements at a hard target and in the atmosphere were done. An improvement of the SNR of a factor 70 (hard target) or 23 (atmosphere) and an improvement in the range of factor 13 were obtained in agreement with the theoretic results. ESA

A THEORETICAL INVESTIGATION OF ELECTRICALLY TUNABLE BIREFRINGENT OPTICAL FILTERS AS THE SPECIAL DISCRIMINATOR IN HYPERSPECTRAL IMAGING SYSTEMS M.S. Thesis
Duane A. Sauve Dec. 1993 67 p
(AD-A273743; AFIT/GEO/ENP/93D-02) Avail: CASI HC A04/MF A01

This study investigated electrically tunable birefringent optical filters for use as the spectral discriminator in hyperspectral imaging systems. Spectral discrimination requirements for hyperspectral systems were defined using specification from two state-of-the-art hyperspectral imaging systems. The spectral discrimination requirements led to the definition of the ideal tunable optical filter for spectral discrimination purposes. Analytical and computer analysis was performed for known birefringent filters which showed promise of electrical tunability, excluding acousto-optic filters. No perfect match was found to the ideal tunable optical filter for hyperspectral imaging defined in this thesis. Both Lyot and Solc based filters exhibited two drawbacks for hyperspectral imaging application: narrow tuning range with linear bandwidth dependence on center wavelength, or wide tuning range and quadratic bandwidth dependence on center wavelength. The Delta-n-tuned Solc filter provided the best compromise between tuning range and bandwidth control; however, it is not practical due to the excessive number of elements required. This thesis provides the needed background for further research in this area and identifies a number of areas for further worthwhile research. DTIC

ASSESSMENT OF STELLARATORS AS REACTORS
J. F. Lyon 1993 26 p Presented at the 9th International Atomic Energy Agency (IAEA) Workshop on Stellarators, Garching, Germany, 10-14 May 1993
(Contract DE-AC05-84OR-21400)
(DE93-017775; CONF-9305210-2) Avail: CASI HC A03/MF A01

Stellarators have significant operational advantages over tokamaks as ignited steady-state reactors: no dangerous disruptions, no need for continuous current drive and power recirculated to the plasma, less severe constraints on the plasma parameters and profiles, and access from the inboard side for easier maintenance. The U.S. is starting a multi-year multi-institutional stellarator reactor study whose purpose is to 'identify and assess the feasibility of critical issues and their consequences for development of the stellarator concept as a steady-state fusion reactor.' The activities during the first year are focusing on physics optimization and selection of one or more stellarator coil configurations for more detailed engineering design evaluation. The physics team is focusing on torsatron modularization, modular stellarators with lower aspect ratio, the divertor geometry, development of transport models, and overall system studies. The engineering team is studying design issues relating to minimizing the inboard thickness of the blanket and shields, the feasibility of the superconducting magnets, and maintenance schemes. DOE

REPORT OF THE JOINT SEMINAR ON SOLID STATE PHYSICS, ATOMIC AND MOLECULAR PHYSICS, AND MATERIALS SCIENCE IN THE ENERGY REGION OF TANDEM ACCELERATORS
Yukio Kazumata, ed. Jan. 1993 103 p In ENGLISH and JAPANESE Seminar held in Tokai, Japan, 22-23 Jan. 1991
(DE93-508268; JAERI-M-92-202; CONF-9101168) Avail: CASI HC A06/MF A02

The Joint Seminar on Solid State Physics, Atomic and Molecular Physics, and Materials Science in the Energy Region of Tandem Acceleration was held at Tokai Research Establishment of JAERI for two days from January 22 to 23, 1991. About 60 physicists and material scientists participated and 18 papers were presented in this seminar. The topics presented in this seminar included lattice defects in semiconductors, ion-solid collisions, atomic collisions by high energy particles, radiation effects on high T(sub c) superconducting materials and FCC metals, radiation effects on materials of space and fusion reactors, uranium compounds and superlattice. ACTIVE PROBING OF PLASMA EDGE TURBULENCE AND FEEDBACK STUDIES ON THE TEXAS EXPERIMENTAL TOKAMAK (TEXT)
T. Uckan, B. Richards (Texas Univ., Austin.), and R. D. Bengtson (Texas Univ., Austin.) Aug. 1993 13 p
(Contract DE-AC05-84OR-21400)
(DE94-001017; ORNL/TM-12424) Avail: CASI HC A03/MF A01

A novel experiment is under way on the Texas Experimental Tokamak (TEXT) to actively modify the turbulence at the plasma edge by launching waves using electrostatic probes in the shadow of the limiter. The experiments are carried out with a wave launching system consisting of two Langmuir probes, which are about 1.8 cm apart in the poloidal direction, with respect to the magnetic field. These probes are operated in the electron side of the (I,V) characteristic. The probe tips are fed separately by independent ac power supplies. Measurements indicate that the wave, launched with a typical frequency image of 15-50 kHz from the edge of the machine top, is received by sensing probes located halfway around the torus. The detected signal strength depends on the frequency of the wave, the plasma current, and the phasing of the applied ac signal between the launching probes. Modifications to the spectra of the density and potential fluctuations are observed. These experiments have been extended to control of the edge plasma fluctuation level using feedback to explore its effects on confinement. When the launcher is driven by the floating potential of the fluctuating plasma at the location of the launching probes, then the fluctuations are suppressed or excited, depending on the phasing between the probe tips, both locally and at the downstream sensing probes. The fluctuation-induced particle flux also varies with the feedback phasing. DOE

IMAGING XUV SPECTROSCOPY OF A Z-PINCH PLASMA IN THE FORMER SOVIET UNION

H. C. Bruns, P. T. Springer, J. A. Emig, N. E. Lanier, and J. A. Hernandez 11 Aug. 1993 9 p Presented at the Annual Meeting of the Society of Photo-Optical Instrumentation Engineers (SPIE), San Diego, CA, 11-16 Jul. 1993
(Contract W-7405-eng-48)
(DE93-040849; UCRL-JC-114803; CONF-930722-38) Avail: CASI HC A02/MF A01

In 1991 a group of scientists from the Angara 5 pulsed power facility at the Kurchatov Institute in Troitsk, Russia had determined the thermal emission from an implosion of xenon gas onto an annular, molybdenum doped foam liner to be 30 TW/sq cm. This represents an extremely efficient conversion of energy into a high fluence radiation field. In order to verify this claim and better understand the process of producing radiation by means of a Z-pinch plasma device, a series of experiments were proposed through a collaboration from Sandia National Laboratory, Albuquerque, Los Alamos National Laboratory, and Lawrence Livermore National Laboratory. Due to previous experience with x-ray spectroscopic measurements in the XUV region, the team from Lawrence Livermore Lab took on the task of designing, constructing, and fielding the necessary diagnostic equipment to spatially and temporally resolve plasma temperatures throughout the implosion of the high Z foam target. CHAOS IN PLASMA SIMULATION AND EXPERIMENT

C. Watts (Texas Univ., Austin.), D. E. Newman (Oak Ridge National Lab., TN.), and J. C. Sprott Sep. 1993 39 p
(Contract DE-FG02-85ER-53198)
(DE94-001574; DOE/ER-53198/223) Avail: CASI HC A03/MF A01

We investigate the possibility that chaos and simple determinism are governing the dynamics of reversed field pinch (RFP) plasmas using data from both numerical simulations and experiment. A large repertoire of nonlinear analysis techniques is used to identify low dimensional chaos. These tools include phase portraits and Poincare sections, correlation dimension, the spectrum of Lyapunov exponents, and short term predictability. In addition, nonlinear noise reduction techniques are applied to the experimental data in an attempt to extract any underlying deterministic dynamics. Two model systems are used to simulate the plasma dynamics. These are the DEBS code, which models global RFP dynamics, and the dissipative trapped electron mode (DTEM) model, which models drift wave turbulence. Data from both simulations show strong indications of low dimensional chaos and simple determinism. Experimental data were obtained from the Madison Symmetric Torus RFP and consist of a wide array of both global and local diagnostic signals. None of the signals shows any indication of low dimensional chaos or other simple determinism. Moreover, most of the analysis tools indicate the experimental system is very high dimensional with properties similar to noise. Nonlinear noise reduction is unsuccessful at extracting an underlying deterministic system. DOE

FLUCTUATIONS AND CONFINEMENT IN ATF

R. C. Isler, J. H. Harris, and M. Murakami 1993 6 p Presented at the 9th IAEA Workshop on Stellarators, Garching, Germany, 10-14 May 1993
(Contract DE-AC05-84OR-21400)
(DE94-000485; CONF-9305210-5) Avail: CASI HC A02/MF A01

In the period immediately prior to the suspension of ATF operation in November, 1991, a great deal of emphasis was placed on investigations of the fundamental mechanisms controlling confinement in this device. At that time, measurements of the density fluctuations throughout the plasma volume indicated the existence of theoretically predicted dissipative trapped electron and resistive interchange instabilities. These identifications were supported by results of dynamic configuration scans of the magnetic fields during which the extent of the magnetic well, shear, and fraction of confined trapped particles were changed continuously. Interpretation of the data from these experiments has been an ongoing exercise. Most recently, analysis of discharges employing strong gas puffing to change density gradients and fluctuation levels have strengthened the view that dissipative trapped electron modes may be present but do not play a significant direct role in energy transport. The present paper summarizes the current understanding concerning the identification of instabilities and their relationship to confinement in ATF. DOE

SUPERCONDUCTING MAGNET SYSTEM FOR THE TPX TOKAMAK

W. V. Hassenzahl, M. R. Chaplin, J. R. Heim, D. D. Lang, T. G. OConnor, D. S. Slack, R. L. Wong, J. P. Zbasnik, T. G. Brown (Princeton Univ., NJ.), and J. C. Citrolo (Princeton Univ., NJ.) 15 Sep. 1993 4 p Presented at the 13th International Conference on Magnet Technology, Victoria, Ontario, 20-24 Sep. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-48)
(DE94-001535; UCRL-JC-114679; CONF-930926-15) Avail: CASI HC A01

The Tokamak Physics Experiment (TPX) will be the first Tokamak using superconducting magnets for both the poloidal and toroidal field. It is designed for advanced Tokamak physics experiments in steady-state and long-pulse operation. The TPX superconducting magnets use an advanced cable-in-conduit conductor (CICC) design similar to that developed in support of the International Thermonuclear Experimental Reactor (ITER). The toroidal field magnets provide 4.0 T at 2.25 m with a stored energy of 1.05 GJ. The poloidal field magnets provide 18.0 V-s to ohmically start and control long burns of a 2.0 MA plasma. DOE

N94-23014 Lawrence Livermore National Lab., CA.

STRUCTURAL ANALYSIS OF A SUPERCONDUCTING CENTRAL SOLENOID FOR THE TOKAMAK PHYSICS EXPERIMENT

T. G. OConnor and J. R. Heim 15 Sep. 1993 4 p Presented at the 13th International Conference on Magnet Technology, Victoria, Ontario, 20-24 Sep. 1993 Limited Reproducibility: More than 20% of this document may be affected by poor print

(Contract W-7405-eng-48)
(DE94-001536; UCRL-JC-112765; CONF-930926-17) Avail: Issuing Activity (Department of Energy (DOE))

The Tokamak Physics Experiment (TPX) concept design uses superconducting coils to accomplish magnetic confinement. The central solenoid (CS) magnet is divided vertically into 8 equal segments which are powered independently. The eddy current heating from the pulsed operation is too high for a case type construction; therefore, a 'no case' design has been chosen. This no case design uses the conductor conduit as the primary structure and the electrical insulation as a structural adhesive. This electrical insulation is the 'weak link' in the coil winding pack structure and needs to be modeled in detail. A global finite element model with smeared winding pack properties was used to study the CS magnet structural behavior. The structural analysis results and peak stresses will be presented. DOE

CAMAC THROUGHPUT OF A NEW RISC-BASED DATA ACQUISITION COMPUTER AT THE DIII-D TOKAMAK
J. F. VanderLaan and J. W. Cummings Oct. 1993 5 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract DE-AC03-89ER-51114)
(DE94-001113; GA-A-21416; CONF-931018-11) Avail: CASI HC A01/MF A01

The amount of experimental data acquired per plasma discharge at DIII-D has continued to grow. The largest shot size in May 1991 was 49 Mbyte; in May 1992, 66 Mbyte; and in April 1993, 80 Mbyte. The increasing load has prompted the installation of a new Motorola 88100-based MODCOMP computer to supplement the existing core of three older MODCOMP data acquisition CPU's. New Kinetic Systems CAMAC serial highway driver hardware runs on the 88100 VME bus. The new operating system is MODCOMP REAL/IX version of AT&T System V UNIX with real-time extensions and networking capabilities; future plans call for installation of additional computers of this type for tokamak and neutral beam control functions. Experiences with the CAMAC hardware and software will be chronicled, including observation of data throughput. The Enhanced Serial Highway crate controller is advertised as twice as fast as the previous crate controller, and computer I/O speeds are expected to also increase data rates. DOE

1993 ANNUAL REPORT FOR THE PHAEDRUS-T RF CURRENT DRIVE EXPERIMENTS
N. Hershkowitz 1993 7 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contract DE-FG02-88ER-53264)
(DE94-001369; DOE/ER-53264/4) Avail: Issuing Activity (Department of Energy (DOE))

After a series of antenna modifications and a program of optimizing our Boronization procedures, we have succeeded in coupling 300 kill of RF power to the plasma. Thomson Scattering shows a 20-60% increase in core T(sub e), and constitutes experimental evidence that the waves are interacting with the electron population. Beam Emission Spectroscopy (BES) data show that the power is deposited in the core and at the edge as predicted by theoretical modeling. Ninety degree phasing of the antenna caused loop voltage drops of 15-25%, which can be interpreted as an increase 5 kA of toroidal plasma current for co-injection phasing versus counter injection phasing. Biased H-modes have been created with a biased electrode. These plasmas have a steeper edge density gradient and reduced edge fluctuations than our normal limiter plasmas and a D(sub alpha) emission drop at the limiter. Radial profiles of soft x-ray line emission have been measured by the Johns Hopkins group and significantly aided in our understanding of impurity generation with RF and in the biased H-mode. Initial reflectometry data shows the presence of RF density fluctuations in the plasma. Different boronization techniques have been tried leading to a higher boron content in the deposited layer and reduced wall recycling. In this report, we outline the series of experiments that we have performed in the last year that led us to our present encouraging results. DOE

CHAOS AND SIMPLE DETERMINISM IN REVERSED FIELD PINCH PLASMAS: NONLINEAR ANALYSIS OF NUMERICAL SIMULATION AND EXPERIMENTAL DATA Ph.D. Thesis
C. A. Watts Sep. 1993 114 p
(Contract DE-FG02-85ER-53198)
(DE94-001575; DOE/ER-53198/224) Avail: CASI HC A06/MF A02

In this dissertation the possibility that chaos and simple determinism are governing the dynamics of reversed field pinch (RFP) plasmas is investigated. To properly assess this possibility, data from both numerical simulations and experiment are analyzed. A large repertoire of nonlinear analysis techniques is used to identify low dimensional chaos in the data. These tools include phase portraits and Poincare sections, correlation dimension, the spectrum of Lyapunov exponents and short term predictability. In addition, nonlinear noise reduction techniques are applied to the experimental data in an attempt to extract any underlying deterministic dynamics. Two model systems are used to simulate the plasma dynamics. These are the DEBS code, which models global RFP dynamics, and the dissipative trapped electron mode (DTEM) model, which models drift wave turbulence. Data from both simulations show strong indications of low dimensional chaos and simple determinism. Experimental data were obtained from the Madison Symmetric Torus RFP and consist of a wide array of both global and local diagnostic signals. None of the signals shows any indication of low dimensional chaos or low simple determinism. Moreover, most of the analysis tools indicate the experimental system is very high dimensional with properties similar to noise. Nonlinear noise reduction is unsuccessful at extracting an underlying deterministic system. DOE

OVERVIEW OF THE ATF STELLARATOR PROGRAM
J. F. Lyon 1993 5 p Presented at the 9th International Atomic Energy Agency (IAEA) Workshop on Stellarators, Garching, Germany, 10-14 May 1993
(Contract DE-AC05-84OR-21400)
(DE94-000371; CONF-9305210-4) Avail: CASI HC A01/MF A01

ATF, the world's largest stellarator, has major radius R(sub 0) = 2.1 m, average plasma radius alpha(sub p) = 0.27 m, and on-axis field B(sub 0) = 2 T. In May 1991, an electrical arc occurred in one of the joints in a helical field (HF) winding, causing severe damage to two of the HF winding segments. A temporary repair was made and ATF resumed operation in September 1991, but operation was limited to B(sub 0) = 1 T. A set of experiments on microwave scattering, confinement scaling, and ion cyclotron heating was completed before ATF was shut down for a permanent repair in November 1991. The microwave scattering measurements of electron density fluctuations in the core of low-collisionality electron cyclotron heated (ECH) plasmas showed features that might be evidence of trapped electron instabilities. DOE

COMPUTATIONAL MODEL OF SURFACE ABLATION FROM TOKAMAK DISRUPTIONS
D. Ehst and A. Hassanein Oct. 1993 4 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract W-31-109-eng-38)
(DE94-002204; ANL/EP/CP-79902; CONF-931018-36) Avail: CASI HC A01/MF A01

Energy transfer to material surfaces is dominated by photon radiation through low temperature plasma vapors if tokamak disruptions are due to low kinetic energy particles (less than 100 eV). Simple models of radiation transport are derived and incorporated into a fast-running computer routine to model this process. The results of simulations are in fair agreement with plasma gun erosion tests on several metal targets. DOE

ARTIFICIAL PLASMA EXPERIMENTS. CHEMICAL RELEASE OBSERVATIONS ASSOCIATED WITH THE CRRES PROGRAM Final Report, 12 Apr. 1985 - 23 Dec. 1993
Stephen B. Mende 21 Jan. 1994 87 p
(Contract NAS8-36630)
(NASA-CR-194871; NAS 1.26:194871) Avail: CASI HC A05/MF A01

This report submitted is the final report and covers work performed

under the contract for the period Apr. 12, 1985 - Dec. 23, 1993. The CRRES program investigated earth plasma environment by active experiments in which metal vapors were injected into the upper atmosphere and magnetosphere. The vapor clouds perturb the ambient ionospheric / magnetospheric environment and the effects could be monitored by passive observing instruments. Our part of the CRRES program, the Artificial Plasma Experiment program, was a ground based and aircraft based investigation to observe artificial chemical releases by optical techniques.

INERTIAL CONFINEMENT FUSION Quarterly Report, Apr. - Jun. 1993
B. J. MacGowan, ed., M. Kotowski, ed., and D. Schleich, ed. 1993 53 p
(Contract W-7405-eng-48)
(DE94-002602; UCRL-LR-105821-93-3) Avail: CASI HC A04/MF A01

This issue of the ICF Quarterly contains six articles describing recent advances in Lawrence Livermore National Laboratory's inertial confinement fusion (ICF) program. The current emphasis of the ICF program is in support of DOE's National Ignition Facility (NIF) initiative for demonstrating ignition and gain with a 1-2 MJ glass laser. The articles describe recent Nova experiments and investigations tailored towards enhancing understanding of the key physics and technological issues for the NIF. Titles of the articles are: development of large-aperture KDP crystals; inner-shell photo-ionized x-ray lasers; x-ray radiographic measurements of radiation-driven shock and interface motion in solid density materials; the role of nodule defects in laser-induced damage of multilayer optical coatings; techniques for Mbar to near-Gbar equation-of-state measurements with the Nova laser; and parametric instabilities and laser-beam smoothing. DOE

THE ROLE OF THE RADIAL ELECTRIC FIELD IN CONFINEMENT AND TRANSPORT IN H-MODE AND VH-MODE DISCHARGES IN THE DIII-D TOKAMAK
P. Gohil, K. H. Burrell, R. J. Groebner, T. H. Osborne, E. J. Doyle (California Univ., Los Angeles.), and C. L. Rettig (California Univ., Los Angeles.) Aug. 1993 6 p Presented at the Workshop on Local Transport Studies in Fusion Plasmas, Varenna, Italy, 30 Aug. - 3 Sep. 1993
(Contract DE-AC03-89ER-51114)
(DE94-002746; GA-A-21415; CONF-9308183-3) Avail: CASI HC A02/MF A01

Measurements of the radial electric field, E(sub r), with high spatial and high time resolution in H-mode and VH-mode discharges in the DIII-D tokamak have revealed the significant influence of the shear in E(sub r) on confinement and transport in these discharges. These measurements are made using the DIII-D Charge Exchange Recombination (CER) System. At the L-H transition in DIII-D plasmas, a negative well-like E(sub r) profile develops just within the magnetic separatrix. A region of shear in E(sub r) results, which extends 1 to 2 cm into the plasma from the separatrix. At the transition, this region of sheared E(sub r) exhibits the greatest increase in impurity ion poloidal rotation velocity and the greatest reduction in plasma fluctuations. A transport barrier is formed in this same region of E times B velocity shear as is signified by large increases in the observed gradients of the ion temperature, the carbon density, the electron temperature and electron density. The development of the region of sheared E(sub r), the increase in impurity ion poloidal rotation, the reduction in plasma turbulence, and the transport barrier all occur simultaneously at the L-H transition. Measurements of the radial electric field, plasma turbulence, thermal transport, and energy confinement have been performed for a wide range of plasma conditions and configurations. The results support the supposition that the progression of improving confinement at the L-H transition, into the H-mode and then into the VH-mode can be explained by the hypothesis of the suppression of plasma turbulence by the increasing penetration of the region of sheared E times B velocity into the plasma interior. DOE

FUSION PLASMA THEORY PROJECT SUMMARIES
Oct. 1993 107 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(DE94-001712; DOE/ER-0603T) Avail: Issuing Activity (Department of Energy (DOE))

This Project Summary book is a published compilation consisting of short descriptions of each project supported by the Fusion Plasma Theory and Computing Group of the Advanced Physics and Technology Division of the Department of Energy, Office of Fusion Energy. The summaries contained in this volume were written by the individual contractors with minimal editing by the Office of Fusion Energy. Previous summaries were published in February of 1982 and December of 1987. The Plasma Theory program is responsible for the development of concepts and models that describe and predict the behavior of a magnetically confined plasma. Emphasis is given to the modelling and understanding of the processes controlling transport of energy and particles in a toroidal plasma and supporting the design of the International Thermonuclear Experimental Reactor (ITER). A tokamak transport initiative was begun in 1989 to improve understanding of how energy and particles are lost from the plasma by mechanisms that transport them across field lines. The Plasma Theory program has actively participated in this initiative. Recently, increased attention has been given to issues of importance to the proposed Tokamak Physics Experiment (TPX). Particular attention has been paid to containment and thermalization of fast alpha particles produced in a burning fusion plasma as well as control of sawteeth, current drive, impurity control, and design of improved auxiliary heating. In addition, general models of plasma behavior are developed from physics features common to different confinement geometries. This work uses both analytical and numerical techniques. The Fusion Theory program supports research projects at U.S. government laboratories, universities and industrial contractors. Its support of theoretical work at universities contributes to the office of Fusion Energy mission of training scientific manpower for the U.S. Fusion Energy Program. DOE

SOME THEORETICAL PROBLEMS OF MAGNETIC DIAGNOSTICS IN TOKAMAKS AND STELLARATORS
V. D. Pustovitov (Kurchatov, I. V. Inst. of Atomic Energy, Moscow, USSR.) Dec. 1993 22 p Submitted for publication
(NIFS-262) Avail: CASI HC A03/MF A01

The main problem of magnetic diagnostics is discussed: which plasma characteristics can be determined from magnetic measurements in tokamaks and stellarators? The reasons are elucidated as to why diamagnetic measurements are reliable and easily interpreted. We also discuss the capabilities of diagnostics based on the measurements of poloidal fields outside the plasma. Author

PELLET ABLATION IN THE LARGE HELICAL DEVICE
Boris V. Kuteev (Kalinin, M. I. Polytechnical Inst., Leningrad, USSR.) Nov. 1993 60 p Original contains color illustrations
(NIFS-260) Avail: CASI HC A04/MF A01

In the program of physical studies on the Large Helical Device (LHD) injection of several hydrogen and deuterium pellets is foreseen. Injection of impurity pellets also may be useful for the plasma diagnostics. The pellet penetration into the LHD plasma is analyzed. In part 1, the present status of the ablation theory and experiment is discussed and an ablation model is formulated. It takes into account the energy distribution of the particles (both electrons and ions) participating in the ablation process, electrostatic effects of the cloud charging and changes of the pellet form during ablation. Plasma shielding effects are not significant in the ablation. The ablation model is compared with the experiments on T-10, JET, TFTR, Heliotron-E, and Tore Supra in part 2. Finally, in part 3, several regimes of the pellet injection into the LHD plasma are simulated including multiple-pellet sequence injection. Optimization of the injection regime is discussed.

TEMPORAL BEHAVIOR OF THE ELECTRON DENSITY PROFILE DURING LIMITER BIASING IN THE HYBTOK-2 TOKAMAK
S. Sasaki (Nagoya Univ., Japan.), Y. Uesugi (Nagoya Univ., Japan.), S. Takamura (Nagoya Univ., Japan.), H. Sanuki, and K. Kadota (Nagoya Univ., Japan.) Nov. 1993 16 p Sponsored by Ministry of Education, Science and Culture
(NIFS-257) Avail: CASI HC A03/MF A01

A rapid change in the detailed edge electron density profile during positively biased limiter experiment is obtained with high temporal resolution of approximately 20 microns using a laser blow-off lithium beam probe technique in HYBTOK-II tokamak. The transient change in the electron density profile and the movement of the position where a steep gradient is formed are experimentally observed. The temporal behavior of the electron density profile correlates well with reductions in the biasing current and the H-alpha emission in the scrape-off layer, and the suppression of electrostatic fluctuations near the edge of the core region.

PROPOSAL OF MODULAR HELIOTRON: ADVANCED MODULAR HELICAL SYSTEM COMPATIBLE WITH CLOSED HELICAL DIVERTOR
Kozo Yamazaki Nov. 1993 30 p
(NIFS-261) Avail: CASI HC A03/MF A01

A new modular helical configuration named 'Modular Heliotron' with clean and efficient helical magnetic divertor is proposed as an extension of the present conventional design of the continuous helical coil system. The sectored helical coils on one plane of the torus and the sectored returning vertical field coils on the other plane are combined. This coil system produces magnetic surfaces nearly equivalent to those of the $l=2$ helical system with one-pair of poloidal coils, and overcomes the defects of construction and maintenance difficulties of the continuous coil systems. This concept satisfies the compatibility between the coil modularity and the sufficient divertor-space utilization, different from previous modular coil designs. The allowable length of the gap between each modular coil is clarified to keep good magnetic surfaces. Typical examples of the reactor coil configuration are described as an extension of the LHD (Large Helical Device) configuration.

STABILIZATION OF THE EXTERNAL KINK AND OTHER MHD ISSUES
J. P. Freidberg (Massachusetts Inst. of Tech., Cambridge.), R. J. Goldston, S. C. Jardin (Princeton Univ., NJ.), G. H. Neilson (Oak Ridge National Lab., TN.), and M Rosenbluth 13 Aug. 1993 28 p Presented at the General Atomics Workshop, San Diego, CA, 23-25 Jun. 1993
(Contract W-7405-eng-48)
(DE94-001541; UCRL-JC-114754; CONF-9306267-1) Avail: CASI HC A03/MF A01

An MHD workshop entitled 'Stabilization of the External Kink and Other MHD Issues' was held 23-25 June 1993. This is a summary report of activities at that workshop, structured to respond to the three questions in the charge. The experimental and theoretical status of these issues, and the R&D needs in each area, are addressed. We discuss the potential impact on the TPX and ITER programs of these issues. The workshop participants came from a broad and diverse range of institutions in the fusion program, including international participants. As a result, we believe the summary here reflects some consensus of the community on these very important program issues, and that the TPX and ITER programs will benefit from these discussions. The title of the workshop was chosen to indicate both our knowledge and our uncertainty of MHD phenomena limiting (beta) and causing disruptions in tokamaks. The purpose was to bring together theorists and experimentalist in order to assess our current understanding of the external kink instability at high (beta) and to assess the potential for passive or active stabilization of the dominant modes. We also outlined the R&D needed for TPX and other future devices. Not only was the preworkshop theory clearly presented, but significant new theoretical results were described for the first time, emphasizing the roles of the resistivity of the cold edge plasma and of the plasma toroidicity in the stability criteria. Excellent reviews of the effects of the vessel walls on plasma stability were given as related to the D3-D, TFTR, JET, PBX-M, and HBT-EP experiments. These results are generally consistent with the more complete theory.

PLASMA INITIATION IN A TOKAMAK WITH CONDUCTING SUPERSTRUCTURE: FIRST RESULTS FROM ALCATOR C-MOD
I. Hutchinson, R. Boivin, P. Bonoli, C. Fiore, J. Goetz, S. Golovato, R. Granetz, M. Greenwald, S. Horne, and A. Hubbard et al Jul. 1993 4 p Presented at the 20th European Conference on Controlled Fusion and Plasma Physics, Lisbon, Portugal, 26-30 Jul. 1993
(Contract DE-AC02-78ET-51013)
(DE94-001565; DOE/ET-51013/303; PFC/CP-93-1; CONF-930720-22)
Avail: CASI HC A01/MF A01

Alcator C-MOD is a compact high field tokamak with capability for high current shaping and closed and open diverters. Full tokamak operation was begun in May 1993 at 5T toroidal field, and plasmas lasting up to 0.4 seconds have been obtained so far. The tokamak's design includes a thick stainless-steel vacuum vessel that is toroidally continuous with resistance about 40 micro-Ohms. The stainless-steel superstructure supporting the toroidal field coil is even more massive, and likewise has no toroidal breaks, primarily because structural strength would suffer. As a result, very large toroidal eddy currents are induced in the structures, especially during current initiation when the loop voltage is high. Future large experiments, such as ITER, are likely to adopt design approaches with comparable conducting structures. Despite the large eddy currents, which can reach 1 MA in Alcator C-MOD, reliable plasma initiation has been established by appropriate adjustment of the time evolution of the coil currents to cancel the passive contribution and obtain the desired field structure. Detailed diagnosis of the full magnetic field structure is necessary to do the adjustment; the field structure is then known in some detail, and its effects on the shape and stability during the current ramp have been studied. Flat-top plasma currents are presently up to 0.4 MA, and elongated and diverted plasmas have been obtained, as well as more circular limited configurations.

START-UP SIMULATIONS OF THE PULSAR PULSED TOKAMAK REACTOR
K. A. Werley and C. G. Bathke 1993 5 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract W-7405-eng-36)
(DE94-002634; LA-UR-93-3599; CONF-931018-56) Avail: CASI HC A01/MF A01

Start-up conditions are examined for a pulsed tokamak reactor that uses only inductively driven plasma current (and bootstrap current). A zero-dimensional (profile-averaged) model containing plasma power and particle balance equations is used to study several aspects of plasma start-up, including: (1) optimization of the start-up pathway; (2) tradeoffs of auxiliary start-up heating power versus start-up time; (3) volt-second consumption; (4) thermal stability of the operating point; (5) estimates of the diverter heat flux and temperature during the start-up transient; (6) the sensitivity of the available operating space to allowed values of the H confinement factor; and (7) partial-power operations.

THE CHEMISTRY OF PARTICULATE FORMATION IN FLUOROCARBON PLASMAS
Richard J. Buss and Willard A. Hareland 1993 16 p Presented at the North Atlantic Treaty Organization Advanced Research Workshop, Toulouse, France, 30 Aug. - 3 Sep. 1993
(Contract DE-AC04-94AL-85000)
(DE94-001500; SAND-93-2057C; CONF-9308151-2) Avail: CASI HC A03/MF A01

The production, suspension, and transport of fluorocarbon particulates in rf discharges have been studied using in situ laser light scattering and ex situ chemical analysis. The time evolution of the spatial distribution of suspended particles was obtained by 2-D imaging of the scattered light. The chemistry of the discharge was varied by the use of a range of pure fluorocarbon gases and mixtures with argon, oxygen, and hydrogen-containing molecules. The addition of hydrogen to a fluorocarbon discharge increases the rate of formation of particles, although these powders are found by FTIR to contain negligible hydrogen. Particle formation rates correlate with polymer deposition rates and are independent of apparatus history. It is proposed that this is a clear example of gas-phase rather than surface processes leading to particle nucleation and growth. DOE

DESIGN OF CENTRAL CONTROL SYSTEM FOR LARGE HELICAL DEVICE (LHD)
K. Yamazaki, H. Kaneko, S. Yamaguchi, K. Y. Watanabe, Y. Taniguchi, and O. Motojima et al Nov. 1993 16 p Presented at the International Conference on Accelerator and Large Experimental Physics Control Systems (ICALEPCS 1993), Berlin, Germany, 18-22 Oct. 1993
(NIFS-258) Avail: CASI HC A03/MF A01

The world's largest superconducting fusion machine, LHD (Large Helical Device), is under construction in Japan, aiming at steady state operations. Its basic control system consists of UNIX computers, FDDI/Ethernet LAN's, VME multiprocessors, and VxWorks real-time operating system. For flexible and reliable operations of the LHD machine, a cooperative distributed system with more than 30 pieces of experimental equipment is controlled by the central computer and the main timing system, and is supervised by the main protective interlock system. Intelligent control systems, such as applications of fuzzy logic and neural networks, are to be adopted for flexible feedback control of plasma configurations besides the classical PID control scheme. Design studies of the control system and related research and development programs with coil-plasma simulation systems are now being performed. The construction of the LHD Control Building on a new site will begin in 1995 after finishing the construction of the LHD Experimental Building, and the hardware construction of the LHD central control equipment will be started in 1996. A first plasma production by means of this control system is expected in 1997. Author (revised)

MEASUREMENT OF ELECTRON TEMPERATURE AND DENSITY IN THE DIII-D NEUTRAL BEAM ION SOURCE ARC CHAMBER
D. H. Kellman, J. Busath, and R. Hong Oct. 1993 5 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract DE-AC03-89ER-51114)
(DE94-001099; GA-A-21398; CONF-931018-4) Avail: CASI HC A01/MF A01

A swept-bias Langmuir probe diagnostic was employed with the DIII-D neutral beam ion source in an effort to study the effects of filament temperature, arc power, and backstreaming energetic electrons on the electron temperature and density of the arc discharge inside the ion source arc chamber. The arc chamber contains six Langmuir probes biased with a negative dc voltage. These probes provide a feedback signal for regulation of the arc power supply, and give a relative indication of plasma uniformity within the arc chamber. For this study, one probe was reconnected to a voltage-sweeping power supply, and probe current versus voltage characteristics were generated. These characteristics provided the information necessary to calculate electron temperature and density. With arc discharge only, the results demonstrated that an filament temperature increases, so does electron density. Electron temperature decreases at a faster rate, however, as required to maintain constant ion maturation current (regulated by the arc power supply). The results also demonstrated that increasing arc power (through control of the arc power supply) results in higher electron temperature and density. Experiments were also performed with probe voltage sweeps during beam extraction, at various accelerator voltage levels and at different delay times after beam turn-on with a fixed acceleration voltage. These results indicated an increase in electron temperature and density as acceleration voltage is increased. However, nearly identical trends result when arc discharges are produced at the same parameter settings as during these beams, but without beam extraction. This indicates minimal influence of backstreaming energetic electrons on electron temperature and density in the arc chamber. Temperature and density also remain fairly constant over time during a long beam pulse. DOE

INVESTIGATION OF THE HEAT HANDLING CAPABILITIES OF DIII-D NEUTRAL BEAMLINE INTERNAL COMPONENTS
J. C. Phillips, C. B. Baxi, and R. Hong Oct. 1993 6 p Presented at the Symposium on Fusion Engineering, Hyannis, MA, 11-15 Oct. 1993
(Contract DE-AC03-89ER-51114)
(DE94-001107; GA-A-21409; CONF-931018-17) Avail: CASI HC A02/MF A01

The current D3-D neutral beam system is a nominal five second pulse length upgrade of a previous design rated for only 500 msec operation. While the ion sources are rated for 60 sec operation, in practice pulse lengths are limited both by the beamline internal components ability to handle the fraction of the power which is scraped off and by the power supplies ability to provide pulse lengths of greater than 5 sec. This paper examines the capability of the existing D3-D neutral beamline heat removing components both in terms of present and desired operating parameters. To date, at 2.5 MW per ion source, pulses are limited to 3.5 sec by beamline internal components, while at lower ratings of 2.0 MW per ion source, up to 5 sec pulses have been achieved. Recent advances and demonstration of the extraction of 3.5 MW per D3-D ion source give an even wider window of operating conditions. A full series of beamline thermocouple data has been collected to determine the heat loading and implied surface temperatures for the various D3-D neutral beamline internal components. These data will be presented along with an analysis of the needs for specific component upgrades, given a desire for 10 sec operation. DOE

MECHANISMS OF ANODE POWER DEPOSITION IN A LOW PRESSURE FREE BURNING ARC Final Report
George C. Soulas and Roger M. Myers (Sverdrup Technology, Inc., Brook Park, OH.) Jan. 1994 28 p Presented at the 23rd International Electric Propulsion Conference, Seattle, WA, 13-16 Sep. 1993; sponsored by AIAA, AIDAA, DGLR, and JSASS
(Contract NAS3-25266; RTOP 506-42-31)
(NASA-CR-194442; E-8303; NAS 1.26:194442; IEPC-93-194) Avail: CASI HC A03/MF A01

Anode power deposition is a dominant power loss mechanism for arc jets and MPD thrusters. In this study, a free burning arc experiment was operated at pressures and current densities similar to those in arc jets and MPD thrusters in an attempt to identify the physics controlling this loss mechanism. Use of a free burning arc allowed for the isolation of

independent variables controlling anode power deposition and provided a convenient and flexible way to cover a broad range of currents, anode surface pressures, and applied magnetic field strengths and orientations using an argon gas. Test results showed that anode power deposition decreased with increasing anode surface pressure up to 6.7 Pa (0.05 torr) and then became insensitive to pressure. Anode power increased with increasing arc current while the electron number density near the anode surface increased linearity. Anode power also increased with increasing applied magnetic field strength due to an increasing anode fall voltage. Applied magnetic field orientation had an effect only at high currents and low anode surface pressures, where anode power decreased when applied field lines intercepted the anode surface. The results demonstrated that anode power deposition was dominated by the current carrying electrons and that the anode fall voltage was the largest contributor. Furthermore, the results showed that anode power deposition can be reduced by operating at increased anode pressures, reduced arc currents, and applied magnetic field strengths and with magnetic field lines intercepting the anode.

EXCITATION BALANCES AND TRANSPORT IN AN INDUCTIVELY COUPLED PLASMA Ph.D. Thesis
Franciscus Henricus Fey 1993 137 p
(ETN-94-95330) Avail: CASI HC A07/MF A02

A series of articles concerning the excitation balances, the transport processes, and their mutual influences in an Inductively Coupled Plasma (ICP) are presented. An ICP is a plasma that is fed with energy by means of an electromagnetic field. It is created in a torch that is placed inside an RF coil. A spectrochemical ICP is concentrated upon. The articles presented concern the following: an experimental study of the instantaneous and the delayed responses of line intensities to power interruption; the response of Li one line intensities to power interruption; a collisional radiative model of Li, which is extended with transport; a model for the evaporation of the droplets and a fluid model for the zone in which the droplets are injected; the characteristic features of free electrons in the active zone; the measurement of the drift velocity of the plasma and the corresponding energy losses. ESA

A RELATIVISTIC THEORY ON WAVE PROPAGATION IN INHOMOGENEOUS MAGNETOPLASMAS Ph.D. Thesis
Maria Johanna vanBruggen-Kerkhof 1992 80 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-94-95322) Avail: CASI HC A05

Several problems of wave propagation in inhomogeneous plasmas are discussed. All the topics stem from the physics of fusion plasmas, such as those studied in tokamaks. The mathematical modeling of such a plasma, including both relativistic effects as well as the inhomogeneity of the plasma, is considered. Some elementary concepts from the theory of plasma physics and wave propagation are treated. Solution methods for the time independent Vlasov-Maxwell system for an inhomogeneous relativistic plasma are considered. The starting point is a plasma model that allows different temperatures for electrons and ions. The possibility of multiple ionization is also taken into account. Wave properties in a homogeneous magnetic field and then in an inhomogeneous magnetic field are considered. ESA

N94-25300# Technische Univ., Eindhoven (Netherlands).
MODELLING OF THERMAL ARGON PLASMAS Ph.D. Thesis
Daniel Anton Benoy 1993 153 p
(ETN-94-95363) Avail: CASI HC A08/MF A02

The construction of a two dimensional time independent plasma simulation model is described. Conditions for the validity of the hydrodynamic approach in the modeling of plasmas are considered. A cut-off procedure for numerical collisional radiative (CR) models is developed and is based on knowledge of the excitation flow in the collision dominated part of an atomic system as revealed by analytical models. The model is applied to ionizing and recombining argon plasma. A CR model, in which a hybrid cut-off technique is used, is applied to recombining plasmas to study the atomic state distribution and the recombination effect. The total radiative loss in atmospheric argon plasmas is calculated, admitting for deviation from local thermal equilibrium. The source terms of the particle, momentum, and energy transport equations are expressed in such a way that they can be used in the numerical model. Physical transport equations for the macroscopic description of thermal plasmas are formulated. ESA

FLUID VELOCITY AND ELECTROMAGNETIC FORCES MEASURED BY A ROTATING LANGMUIR PROBE IN THE SCRAPE OFF LAYER OF JFT-2M
B. M. Annaratone, T. Shoji (Japan Atomic Energy Research Inst., Tokai.), H. Maeda (Japan Atomic Energy Research Inst., Tokai.), S. Ohdachi (Tokyo Univ., Japan.), and H. Tamai (Japan Atomic Energy Research Inst., Tokai.) 1992 24 p Sponsored in part by Japan International Science and Technology Exchange Center, Japan
(OUEL-1968/92; ETN-94-95154) Avail: CASI HC A03/MF A01

Measurements obtained by the technique of an assembly of planar Langmuir probes rotating in the scrape off layer of JFT-2M are described. The probes scan the radial direction and can rotate 360 deg around a radius so measuring the direction of the magnetic field and of the density of current in the magnetic surfaces. Experiments with and without divertor biasing show different configurations of the electric fields and of the ion saturation current. Results show that: the probe identifies the direction of the local ion density of current; electrons flow in the verse opposite to the ion flux; the ion current has an angle respect to the magnetic field; the j by B force is always confining; with a divertor negative bias the toroidal current flows opposite to the main plasma current in a narrow layer where high radial electric fields appear. The estimate of the amplitude of the ion density of current is deduced from the ratio of the upstream to the downstream ion saturation current. The fluid equation for electrons and ions can, to some extent, be solved in steady state and the value of fluid velocity for the electrons and pressure gradient for the ions are calculated.

THE ANOMALOUS TRANSPORT CAUSED BY PARTICLES TRANSVERSE DRIFT
Mao-Quan Wang (Academia Sinica, Beijing, China.) Jan. 1992 11 p
(DE93-613685; CNIC-00569; ASIPP-0028) Avail: CASI HC A03/MF A01 (US Sales Only)

The plasma anomalous transport caused by particles transverse drift in a system has been completed, in which the magnetic surfaces are disrupted by a stochastic perturbation of magnetic field. In ergodic region the motion equation can be written in Langevin equation and diffusion coefficient D perpendicular can be obtained from Fokker-Planck model. Comparing with another diffusion coefficient D perpendicular derived by the diffusion of field lines in the quasilinear approximation, the D perpendicular obtained from Fokker-Planck model has the similar form and same order of magnitude. The two D perpendicular's are supplement to each other. Only when they are combined into one, will the result be completed. DOE

(DE93-613719; CNIC-00513; IAPCM-0018) Avail: CASI HC A03/MF A01 (US Sales Only)

By using 3/2-D particle simulation code, the stimulated Raman scattering (SRS) in planar and Hohlraum targets is studied. Evaluations of linear growth rate of scattering electromagnetic waves and Langmuir waves and nonlinear saturation are obtained in detail. Other results such as electron distribution function, electron temperature, and the fraction of super hot-electrons produced by SRS are also given. The density distribution in the underdense coronal plasma region is determined by the analysis of SRS spectrum. These theoretical results are in agreement with experimental observations from the Shenguang-12 Nd-glass laser facility. DOE

N94-25331# China Nuclear Information Centre, Beijing.
LHCD (LOW HYBRID CURRENT DRIVE) EXPERIMENT ON THE HT-6B TOKAMAK
Jan. 1992 10 p Prepared in cooperation with Academia Sinica, Beijing, China
(DE93-613720; CNIC-00577; ASIPP-0030) Avail: CASI HC A02/MF A01 (US Sales Only)

LHCD (lower hybrid current drive) experiment was performed on the HT-6B tokamak recently. The RF (radio frequency) system consisted of a 100 kW, 2.45 GHz power source and a multi-junction antenna with relative narrow power spectrum. At relative high density, eta approximately = 0.2 (10(exp 19)m(exp -2) kA/kW) was achieved. The MHD modes and sawteeth were strongly affected by LHW (low hybrid wave). DOE

Zhao-Xing Ren (Academia Sinica, Beijing, China.), Yan-Ya Sheng (Academia Sinica, Beijing, China.), Yi-Cai Shi (Academia Sinica, Beijing, China.), Hai-Hu Wen (Academia Sinica, Beijing, China.), and Xiao-Wen Cao (Academia Sinica, Beijing, China.) Jun. 1991 15 p Limited Reproducibility: More than 20% of this document may be affected by poor print
(DE93-613909; CNIC-00511; ASIPP-0027) Avail: Issuing Activity (Department of Energy (DOE)) (US Sales Only)

The evaporating deposition of Ti film and Cu film by using microwave electron cyclotron resonance (ECR) technique was investigated. It deposition rate was about 50 nm/min and the temperature of the substrate was 50 to approximately 150 C. The thin amorphous films with strong adherent force were obtained. The sputtering deposition with ECR plasma was studied by employing higher plasma density and ionicity and negative substrate potential to make YBaCuO superconducting film. Its film was compact and amorphous with a thickness of 1.0 micron and the deposition rate was about 10 nm/min. The results show that this technique can initiate a high density and high ionicity plasma at lower gas pressure (10(exp -2) to approximately 10(exp -3)Pa). This plasma is the most suitable plasma source in thin film deposition process and surface treatment technique. DOE

MODIFICATION IN THE KINETIC SOLUTION FOR MAGNETIZED PLASMAS
C. Y. Chen Sep. 1992 6 p
(DE93-613687; IC-92/274) Avail: CASI HC A02/MF A01 (US Sales Only)

By relating to the guiding-center drift equation, effective forces are introduced into the linearized Vlavov equation, which leads to modification in the standard kinetic solution for uniformly magnetized plasmas. In the newly-proposed formalism, all the convective (drift) currents induced by E x B(sub 0), nabla B and (n(center dot)nabla)n are properly formulated. DOE

EFFECT OF LHCD (LOW HYBRID CURRENT DRIVE) ON TEARING MODE INSTABILITY
Zheng-Ming Sheng (Academia Sinica, Beijing, China.), Nong Xiang (Academia Sinica, Beijing, China.), and Guo-Yang Yu (Academia Sinica, Beijing, China.) Jan. 1992 8 p
(DE93-613700; CNIC-00576; ASIPP-0029) Avail: CASI HC A02/MF A01 (US Sales Only)

Effect of LHCD (low hybrid current drive) on tearing mode instability is investigated through both kinetic and MHD approaches. In linear kinetic theory, the response of the fast electrons driven by LHCD to the tearing mode perturbations results in reductions of both the growth rate and the width of the perturbative layer of tearing mode in collisional as well as semi-collisional regimes. From MHD theory and LHCD simulation in tokamak geometry, it is shown that LHCD leads to both modification of the current profile and outward shift of the rational surfaces and hence to variation of (delta) of the tearing mode. Mostly LHCD plays a stabilizing role against tearing modes. However, under some conditions considered, LHCD can stabilize tearing modes in higher-q(sub a) plasma while destabilize it in lower-q(sub a) case, which is in a qualitative agreement with some experimental observation. PLASMA SPRAYED THERMAL BARRIER COATINGS: PRODUCTION, CHARACTERIZATION AND TESTING Ph.D. Thesis
Adriaan Thomas Jacqu Verbeek 1992 253 p
(Contract IOP-TK-86.B051)
(ISBN-9-03-860082-8; ETN-94-95316) Avail: CASI HC A12/MF A03

A research program on thermal barrier coatings which covered the whole field of production, characterization, and testing of plasma sprayed thermal barrier coatings, consisting of a metallic bondcoat and a ceramic topcoat is described. The goal was to produce a thermal barrier coating with both a high thermal shock strength and a high erosion resistance. To obtain this goal, all factors influencing the characteristics and the properties of the ceramic topcoat were investigated by experiments on the basis of theoretical models. The behavior of single zirconia particles during the plasma spray process is described. The formation of cracks in plasma sprayed barrier coating is examined using acoustic emission evaluation, combined with the three point bending test. Results of thermal shock and erosion tests carried out on the different types of coatings are presented. ESA

ULTRAVIOLET PHOTOSULFIDATION OF III-V COMPOUND SEMICONDUCTORS FOR ELECTRONIC PASSIVATION
K. R. Zavadil, C. I. H. Ashby, A. J. Howard, and B. E. Hammons 1993 16 p Presented at the 40th National Symposium of the American Vacuum Society (AVS), Orlando, FL, 15-19 Nov. 1993
(Contract DE-AC04-94AL-85000)
(DE94-001417; SAND-93-1107C; CONF-9311104-2) Avail: CASI HC A03/MF A01

A new vacuum-compatible passivation technique for 3-5 compound semiconductors has been developed. Sulfur passivation of GaAs(100) is produced by ultraviolet photolytic deposition of a sulfide species from vapor phase elemental sulfur. Photoluminescence studies of the photosulfided GaAs reveal a degree of passivation greater than or equal to that produced by conventional (NH4)(sub 2)S solution treatment. X-ray Photoelectron Spectroscopy has shown that the sulfur resides on the surface as a single reduced sulfur species, either as sulfide of disulfide, indicating complete fragmentation of the S8 ring by UV light in proximity to the surface. The degree of photosulfidation depends strongly on surface preparation as demonstrated by the described surface oxide removal studies. DOE

A NONLINEAR DEGENERATING PARABOLIC PROBLEM FROM THE THEORY OF TYPE 2 SUPERCONDUCTORS
B. H. Gilding and M. Vallentgoed Jan. 1993 39 p Sponsored by Netherlands Organization for Scientific Research
(MEMO-1112; ETN-94-94748) Avail: CASI HC A03/MF A01

A boundary value problem for a nonlinear partial differential equation is studied. This problem arises as a model for the current distribution in a multifilamentary wire in which the filaments consist of a type 2 superconducting material. The equation is ostensibly of parabolic type, but displays two types of degeneracy. The derivation of the model is explained. The existence and the uniqueness of a solution of the boundary value problem are proved. A comparison principle and some regularity results for its solution are established. The physical interpretation of the different results is discussed. ESA

HIGH-T(c) SUPERCONDUCTING SUPERLATTICES
R. F. Wood Jun. 1993 17 p Presented at the International Symposium on High-Tc Superconductivity and Its Applications, Cairo, Egypt, 4-16 Apr. 1993 Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contract DE-AC05-84OR-21400)
(DE93-019200; CONF-9304191-3) Avail: Issuing Activity (Department of Energy (DOE))

Superlattices composed of YBa2CU3O7 and PrBa2Cu3O7 were studied extensively experimentally and several theoretical attempts to correlate the resistivity as a function of temperature with the superlattice structure have appeared in the literature. The theoretical interest in such structures comes about primarily because of insight into dimensionality effects, interlayer coupling, and interlayer charge redistribution in high-T(sub c) superconductors. On the experimental side, there are possibilities for device applications that are just now beginning to be explored. After an overview of the experimental work and a discussion of charge transfer calculations, a description of how the experimental data can be explained using a model that incorporates Kosterlitz-Thouless (vortex-antivortex unbinding) and Azlamazov-Larkin (fluctuation-enhanced conductivity) theories in the resistive transition region and charge-transfer effects, variable-range hopping, etc. in the normal state. Difficulty in disentangling charge transfer and dimensionality effects in determining the nominal transition temperature is pointed out and other mechanisms that influence the width of the resistive transition are considered. DOE

Civale (International Business Machines Corp., Yorktown Heights, NY.), and A. D. Marwick (International Business Machines Corp., Yorktown Heights, NY.) 1993 8 p Presented at the International Cryogenic Engineering Conference and International Cryogenic Materials Conference, Albuquerque, NM, 12-16 Jul. 1993
(Contract W-31-109-eng-38)
(DE93-017416; ANL/MCT/CP-80158; CONF-930703-9) Avail: CASI HC A02/MF A01

Silver-clad composite tapes of Bi(Pb)SrCaCuO-2223 were irradiated with 1 GeV Au(23+) ions perpendicular to the tape plane, creating columnar tracks with 10 nm diameter. Detailed transmission electron microscopy shows continuous columns, but with variations in the track thickness of +/- 2 nm. Magnetic hysteresis measurements show substantial enhancement of superconducting current density at most temperatures and fields. Granular and nongranular models for the origin of the magnetic signals are discussed. The results indicate the potential for further performance improvement in high temperature superconducting wire technology, as well as limits in the high-field performance at 77 K. DOE

FLOATING WELL BASED DESIGN METHODOLOGY AIMED TO IMPROVE LATCH-UP IMMUNITY IN A CMOS/DMOS SMART POWER TECHNOLOGY Ph.D. Thesis - Toulouse Univ. [IMMUNITE AU 'LATCH-UP' D'UNE TECHNOLOGIE DE PUISSANCE INTELLIGENTE CMOS/DMOS BASEE SUR UN CONCEPT DE PUITS FLOTTANT ET APPLICATIONS]
Manuel PuigVidal 1993 188 p In FRENCH Sponsored in part by Conseil Regional Midi-Pyrenees, France; Ministere de la Recherche et de la Technologie, Paris, France; and PROMETHEUS/PROCHIP program
(LAAS-93093; ETN-94-95187) Avail: CASI HC A09/MF A02

In order to improve the latch up immunity of Complementary Metal Oxide Semiconductors/Diffusion Metal Oxide Semiconductor (CMOS/DMOS) technology, a low cost solution based on a floating well concept is proposed. The deep P(plus) diffusion inherent to a DMOS structure is used to realize a ring that surrounds the NMOS transistor in the P well and slightly overlaps the source diffusion. A CMOS/DMOS technology was developed and a test vehicle designed and realized. Improvements in both static and dynamic latch up immunity with regard to standard CMOS structure are demonstrated by the experimental results. NMOS transistor analysis shows the deep P(plus) ring efficiency in evacuating parasitic currents and proper transistor performance. Two applications, photodetector and temperature detector, based on a floating well concept are proposed and validated in 2 micrometers CMOS technology. ESA

SPIN-POLARON THEORY OF HIGH-T(c) SUPERCONDUCTIVITY. 2: ELECTRONIC STRUCTURE OF THE CuO2 PLANES
R. F. Wood Jun. 1993 13 p Presented at the International Symposium on High-Tc Superconductivity and Its Applications, Cairo, Egypt, 4-16 Apr. 1993
(Contract DE-AC05-84OR-21400)
(DE93-019197; CONF-9304191-4) Avail: CASI HC A03/MF A01

After an introductory discussion of electronic structure calculations for the CuO2 planes in the copper-oxide based high-T(sub c) superconductors, the method suggested by Slater for studying antiferromagnetic (AF) metals is described. In this method, as applied here, the chemical unit cell is doubled to form a magnetic unit cell which contains one Cu ion with predominantly up spin and one with predominantly down spin. Down spins are kept off up-spin sites, and conversely, by the introduction of a Hubbard U term. As a result, the band structure obtained is typical of that for a Mott-Hubbard (M-H) or, more generally, a charge transfer insulator. Conductivity in the a-b plane results when holes are introduced into the M-H valence band. The band structure as a function of the parameters in Koster-Slater type calculations is discussed and the Fermi surface is described. A calculation of the delocalization energy for spin-polaron formation is carried out within the context of the band calculations. DOE

THE DE HAAS-VAN ALPHEN MEASUREMENTS IN Ba(0.6)K(0.4)BiO3
R. G. Goodrich (Louisiana State Univ., Baton Rouge.), C. Grienier (Louisiana State Univ., Baton Rouge.), and D. Hall (Louisiana State Univ., Baton Rouge.) Aug. 1993 9 p Presented at the Conference on Spectroscopies in Novel Superconductors, Santa Fe, NM, 17-19 Mar. 1993 Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contracts W-31-109-eng-38; W-7405-eng-36)
(DE93-041169; ANL/MSD/CP-80681; LA-UR-93-3127; CONF-930367-9)
Avail: Issuing Activity (Department of Energy (DOE))

Measurements of dHvA were made on the 32 K cubic superconductor Ba(0.6)K(0.4)BiO3 using a 50 Tesla pulsed field magnet at NHMFL (Los Alamos) and a 18 T superconducting magnet (LSU). Data were taken with the magnetic field aligned along the (001) direction, at 1.5 to 3.9 K. The pulsed fields were high enough to drive the system well into the normal state. Analysis shows that the frequencies of the observed dHvA oscillations arise from a several Fermi surface sheets. One cross section was nearly identical with that predicted by a new LDA calculation. DOE

CHARACTERIZATION OF CCD-BASED IMAGING X RAY DETECTORS FOR DIFFRACTION EXPERIMENTS
I. Naday, S. Ross, M. Kanyo, E. Westbrook, and M. Westbrook 1993 5 p Presented at the Synchrotron Radiation Instrumentation, Gaithersburg, MD, 23-26 Aug. 1993 Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contract W-31-109-eng-38)
(DE93-041343; ANL/ECT/CP-80138; CONF-930824-6) Avail: Issuing Activity (Department of Energy (DOE))

High resolution CCD-based imaging detectors are successfully used in

X ray diffraction experiments. Some of the detectors are commercially available, others have been developed by research groups around the world. Reliable comparison of the performance must be based on thorough testing of all relevant characteristics of these detectors. We describe methods of measurement of detector parameters such as conversion gain, linearity, uniformity, point spread function, geometrical uniformity, dark current, and detective quantum efficiency. As an example for the characterization, test results of a single module fiber optic taper/CCD X ray detector will be presented. The projected performance of a large area, array detector consisting of nine CCD's and fiberoptic taper modules, will be given. This new detector (the 'Gold' detector) will be installed on Beamline X8C at the Brookhaven National Laboratory at the NSLS Synchrotron. DOE

SPIN-HOLE DOPING IN THE KONDO INSULATOR Ce3Bi4Pt3 STUDIED BY NEUTRON SCATTERING
A. Severing (Institut Laue-Langevin, Grenoble, France.), T. Perring (Rutherford Appleton Lab., Chilton, England.), J. D. Thompson, Z. Fisk, and P. C. Canfield 1993 11 p Presented at the International Conference on Strongly Correlated Electron Systems, La Jolla, CA, 16-19 Aug. 1993
(Contract W-7405-eng-36)
(DE93-040107; LA-UR-93-2949; CONF-930865-4) Avail: CASI HC A03/MF A01

To investigate the effect of non-magnetic impurities on gap formation and stability in Kondo insulators, we have performed inelastic neutron scattering experiments on (Ce(1-x)La(x))3Bi4Pt3, with x = 0.0, 0.1, 0.25 and 1.0. Data were collected at the Rutherford spallation source using incident neutron energies of 30 and 100 MeV and with the sample temperature fixed at 10K, well below (Delta)g/k(sub B). The gap edge, defined from the rapid onset of scattering intensity, decreases quadratically with La content. However, the energy (Delta)(sub g) at which the magnetic intensity reaches one-half its maximum value scales with x and the temperature T(sub max) at which the static susceptibility is maximum. (Delta)g/k(sub B)T(sub max) is independent of x and equal to 2.5 +/- 0.1, a value curiously close to the total angular momentum of Ce(3+). Three important conclusions are drawn from these observations: (1) As suggested theoretically, T(sub max) does provide a measure of the gap produced in the spin-excitation spectrum of Kondo insulators. (2) Creation of spin holes by thermal excitation or La substitution has comparable effects on the gap. (3) The existence of a spin gap even with significant perturbation in the Ce-sublattice periodicity suggests that coherence effects are not important for the existence of the gap and that spin dynamics are determined locally. DOE

PHYSICS WITH CHEMICALLY AND ISOTOPICALLY PURE SEMICONDUCTORS
E. E. Haller May 1993 26 p Presented at the JASOWIEC 1993, Warsaw, Poland, 24-28 May 1993
(Contract DE-AC03-76SF-00098)
(DE93-040120; LBL-34280; CONF-9305280-1) Avail: CASI HC A03/MF A01

Chemically and isotopically pure semiconductors offer a wealth of interesting physics. We review a number of impurity complexes which were discovered in ultrapure Germanium. They have led the way to the widely pursued studies of hydrogen in numerous semiconductors. Isotope related effects and processes include neutron transmutation doping, a technique used for a number of silicon and germanium devices. Isotopically pure and deliberately mixed crystals of germanium have been grown recently and have been used to study the dependence of the indirect bandgap and phonon properties on the mass and mass disorder of the nuclei. The large number of stable isotopes of the various semiconductors present a great potential for basic and applied studies. Semi-conductor isotope engineering may become a reality because of the new economic and political world order. DOE

THE ELASTIC AND ELECTROMECHANICAL PROPERTIES OF BaTiO3 SINGLE CRYSTAL THROUGH THE FERROELECTRIC TRANSITION
Z. Li, M. Grimsditch, and S. K. Chan Jul. 1993 7 p Presented at the 8th International Meeting on Ferroelectricity, Gaithersburg, MD, 8-13 Aug. 1993
(Contract W-31-109-eng-38)
(DE94-001437; ANL/MSD/CP-78506; CONF-930852-3) Avail: CASI HC A02/MF A01

Using Brillouin scattering and impedance methods, the elastic, piezoelectric, and dielectric properties have been determined for monodomain single crystal BaTiO3 from 23 to 160 C. In the cubic phase (T greater than 130 C) only the compressional elastic constant C11 exhibits partial softening of about 6% upon cooling. During the tetragonal to cubic phase transition, most elastic constants show discontinuous changes; either stiffening or softening. These and other results are discussed in terms of precursive effects through the electromechanical interaction of the ferroelectric phase transformation. DOE

ANISOTROPIC UNIAXIAL PRESSURE EFFECTS IN YBa2Cu3O(7-DELTA)
U. Welp, M. Grimsditch, S. Fleshler, W. Nessler, B. Veal, and G. W. Crabtree Oct. 1993 20 p Presented at the Physics and Chemistry of Molecular and Oxide Superconductors, Eugene, OR, 27-31 Jul. 1993
(Contract W-31-109-eng-38)
(DE94-001456; ANL/MSD/CP-80962; CONF-930710-4) Avail: CASI HC A03/MF A01

We present measurements of the uniaxial pressure dependence of T(sub c) of untwinned YBa2Cu3O(7-delta) crystals with various oxygen stoichiometries. For all samples investigated, T(sub c) decreases for pressure along a, increases for pressure along b, and, in oxygen deficient samples, increases strongly for pressure along c. These results are compared to the behavior found in the La(2-x)Sr(x)CuO4 and YBa2Cu4O8 systems. Neither the model of pressure induced charge transfer nor coupling to orthorhombic distortions can explain all the data. However, presence of singularities in electronic density of states close to Fermi energy is a possible origin of the observed behavior. Preliminary data on pressure dependence of c-axis and in-plane resistivities in twinned crystals are consistent with this view. DOE

COHERENCE LOST? NOT-SO-FAST ESCAPES FROM THE IN-PHASE ATTRACTOR OF A SET OF GLOBALLY COUPLED NONLINEAR OSCILLATORS
J. Theiler and S. Nichols (Georgia Inst. of Tech., Atlanta.) 1 Sep. 1993 17 p Presented at the Fluctuations and Order: The New Synthesis Workshop, Los Alamos, NM, 9-12 Sep. 1993
(Contract W-7405-eng-36)
(DE94-000799; LA-UR-93-3241; CONF-9309185-2) Avail: CASI HC A03/MF A01

The sensitivity to noise of the coherent (or in-phase) attractor for a set of N globally coupled maps is studied; these discrete-time maps are associated with the continuous-time equations of motion for a series array of Josephson junction oscillators. We investigate both geometrical properties of the basin of attraction in the large N limit, and the implications of this geometry on the average time for the system to 'escape' from the coherently oscillating mode. Our main results are that the attractor basin maintains a box-shaped 'core' of finite radius even as N approaches infinity, and that the in-phase attractor of a large N array is much less vulnerable to noise than are the out-of-phase attractors. DOE

ANOMALOUS MAGNETORESISTANCE BEHAVIOR OF SUPERCONDUCTING Nd(2-x)Ce(x)CuO(4-y) SINGLE CRYSTAL
M. C. deAndrade, Y. Dalichaouch (California Univ., San Diego, La Jolla.), and M. B. Maple (California Univ., San Diego, La Jolla.) 1993 9 p Presented at the International Conference on Strongly Correlated Electronic Systems, San Diego, CA, 15-19 Aug. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-7405-eng-36)
(DE94-000806; LA-UR-93-3144; CONF-9308173-2) Avail: CASI HC A02

Magnetoresistance measurements on a superconducting Nd(2-x)Ce(x)CuO(4-y) single crystal with T(sub c) approximately 7 K were made with magnetic fields H applied parallel (H parallel c) and perpendicular (H perpendicular c) to the tetragonal c-axis. For H parallel c, the resistive superconductive transition curves exhibit a double transition at low temperatures and high magnetic fields. This double resistive transition has a maximum near T approximately 1.1 K, followed by an extremely sharp transition into the superconducting state. For applied fields of 1kOe, the resistivity first goes to zero, increases again to a finite value, and then goes through a second transition. In this region, the resistivity exhibits non-ohmic behavior for low current densities and ohmic behavior for larger measuring currents. The resistivity for H perpendicular c does not exhibit any anomalous behavior or a maximum for 0 less than or equal to H less than or equal to 60 kOe and 4 less than or equal to T less than or equal to 7 K. DOE

BRIDGMAN'S CONCERN
R. A. Graham 1993 10 p Presented at the 14th International Conference of the International Association for the Advancement of High Pressure Science and Technology, Colorado Springs, CO, 27 Jun. - 2 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-040900; SAND-93-1400C; CONF-930676-51) Avail: CASI HC A02/MF A01

In 1956 P.W. Bridgman published a letter to the editor in the Journal of Applied Physics reporting results of electrical resistance measurements on iron under static high pressure. The work was undertaken to verify the existence of a polymorphic phase transition at 130 kbar (13 GPa) reported in the same journal and year by the Los Alamos authors, Bancroft, Peterson and Minshall for high pressure, shock-compression loading. In his letter, Bridgman reported that he failed to find any evidence for the transition. Further, he raised some fundamental concerns as to the state of knowledge of shock-compression processes in solids. Later it was determined that Bridgman's static pressure scale was in error, and the shock observations became the basis for calibration of pressure values in static high pressure apparatuses. In spite of the error in pressure scales, Bridgman's concerns on descriptions of shock-compression processes were perceptive and have provided the basis for subsequent fundamental studies of shock-compressed solids. The present paper, written in response to receipt of the 1993 American Physical Society Shock-Compression Science Award, provides a brief contemporary assessment of those shock-compression issues which were the basis of Bridgman's 1956 concerns. LOW TEMPERATURE DIFFUSION OF HYDROGENIC SPECIES IN OXIDE CRYSTALS: RADIATION INDUCED DIFFUSION
Y. Chen and R. Gonzalez (Madrid Univ., Spain.) 1993 15 p Presented at the International Union of Materials Research Societies on Advanced Materials, Tokyo, Japan, 31 Aug. - 4 Sep. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract DE-AC05-84OR-21400)
(DE94-000374; CONF-9308122-9) Avail: Issuing Activity (Department of Energy (DOE))

Normally stable configurations of substitutional protons or deuterons in oxide crystal become highly unstable during ionizing radiation at room temperature, resulting in the displacements of these species. The cross section for radiation-induced-displacements of protons is exceedingly large and is a strong function of temperature. The displacement cross section of protons from cation sites is twice that of deuterons. Diffusion of these species can be induced at temperatures not otherwise possible by thermal means. For example, using electron irradiation near room temperature the O-H bond is readily broken and the hydrogenic species can be channeled along the c-axis in TiO2 by an applied electric field. Radiation induced displacements of protons from anion sites (hydride ions) at room temperature are also discussed. DOE

ATOMIC-SCALE STRUCTURE OF GRAIN BOUNDARIES: CORRELATIONS TO GRAIN BOUNDARY PROPERTIES
K. L. Merkle, M. I. Buckett, Y. Gao, S. J. Rozeveld, B. L. Vuchic, and D. Wolf Sep. 1993 7 p Presented at the International Union of Materials Research Societies on Advanced Materials, Tokyo, Japan, 31 Aug. - 4 Sep. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-31-109-eng-38)
(DE94-001289; ANL/MSD/CP-80905; CONF-9308122-10) Avail: CASI HC A02

It is generally believed that many properties of solid interfaces are ultimately determined by their structure and composition at the atomic level. We report here on work in two areas of grain boundary (GB) research in which structure-property correlations have been investigated recently. HREM observations in connection with computer modeling of GB's in fcc metals have given considerable insight into correlations between GB energy and atomic-scale GB structure. Efforts to understand and possibly control the supercurrent transport behavior across GB's in high-temperature superconductors require the combination of microstructure characterizations with investigations of electric transport properties. In both areas considerable progress is being made and has already lead to important insights concerning interfacial properties. DOE

DESIGN OF MICROCHANNELS FOR CRYOSTABILIZATION OF HIGH TEMPERATURE SUPERCONDUCTING MAGNETS
Y. S. Cha, J. R. Hull, and R. C. Niemann 1993 23 p Presented at the Annual Winter Meeting of the ASME, New Orleans, LA, 28 Nov. - 3 Dec. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-31-109-eng-38)
(DE94-001324; ANL/MCT/CP-78916; CONF-931121-28) Avail: CASI HC A03

Microchannel cooling using subcooled liquid nitrogen is proposed to cryogenically stabilize high-temperature superconducting magnets. Various design constraints and parameters are identified and summarized. A graphical method is proposed for the design of microchannel systems. This graphical method helps to reduce the amount of work towards achieving optimum design for a specific application because there are a large number of parameters involved in the design of a microchannel system. The proposed graphical method are illustrated by three examples. The results show that a design window may appear for a given application. Any point within this window is an acceptable design. Another advantage of the graphical method is that, by selecting a design point, the design margin against various design contrains can be easily identified. Any two of the design variables can be selected as the independent variables. The choice depends on specific application and, to a certain extent, on individual preference. The three examples revealed that, for high current density applications, the most scattering constraints are the coolant temperature rise and the fin tip temperatures provided that a moderate pressure drop can be tolerated. PROCESSING OF YBCO SUPERCONDUCTORS FOR IMPROVED LEVITATION FORCE
U. Balachandran and W. Zhong May 1993 5 p Presented at the Joint MMIJ/TMS International Conference on Processing Materials for Properties, Honolulu, HI, 7-10 Nov. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-31-109-eng-38)
(DE94-001326; ANL/ET/CP-78724; CONF-931103-4) Avail: CASI HC A01

One objective of the ANL superconductor program is to develop improved processing methods for production of YBCO superconductors with higher levitation forces suitable for low-friction, superconductor/permanent-magnet bearings and flywheel-energy-storage applications. From the standpoint of these applications, melt-processed bulk YBCO superconductors are of considerable interest. Levitation force and flux-pinning properties depend on microstructural features of the superconductors. We have added several chemical species to YBCO to alter the microstructure and have used a seeding technique to induce crystallization during melt processing. In this paper, we discuss the effects of various process parameters, additives, and a seeding technique on the properties of melt-processed bulk YBCO samples and compare the results with solid-state-sintered superconductors. PHOTO-INDUCED ANTIFERROMAGNETIC INTERLAYER COUPLING IN Fe SUPERLATTICES WITH IRON SILICIDE SPACERS
J. E. Mattson, E. E. Fullerton, S. Kumar, S. R. Lee, C. H. Sowers, M. Grimsditch, S. D. Bader, and F. T. Parker (California Univ., San Diego, La Jolla.) Sep. 1993 22 p Presented at the 38th Annual Conference on Magnetism and Magnetic Materials, Minneapolis, MN, 15-18 Nov. 1993
(Contract W-31-109-eng-38)
(DE94-001345; ANL/MSD/CP-79360; CONF-931133-5) Avail: CASI HC A03/MF A01

Sputtered Fe/FeSi films possessing antiferromagnetic (AF) interlayer coupling at room temperature develop ferromagnetic remanence when cooled below 100K, but the AF coupling can be restored at low temperature by exposure to visible light of sufficient intensity (greater than 10 mW/mm(exp 2)). We attribute these effects to charge carriers in the FeSi spacer layer which, when thermally or photo-generated, are capable of communicating spin information between the Fe layers. DOE

MUON SPIN RELAXATION STUDIES OF THE INTERPLAY BETWEEN MAGNETISM AND SUPERCONDUCTIVITY IN HEAVY FERMION SYSTEMS
R. H. Heffner 1993 15 p Presented at the 1993 Actinides, Santa Fe, NM, 19-24 Sep. 1993
(Contract W-7405-eng-36)
(DE94-000700; LA-UR-93-3449; CONF-930905-6) Avail: CASI HC A03/MF A01

The interplay between magnetism and superconductivity in heavy fermion systems is discussed and the role of muon spin relaxation in elucidating these properties is emphasized. Relevant properties of all six heavy fermion superconductors are briefly surveyed and instances where superconductivity and magnetism compete, coexist, and couple with one another are pointed out. Current theoretical concepts underlying these phenomena are highlighted. DOE

APPLICATION OF MAXIMUM ENTROPY AND IRREDUCIBLE CLUSTER INTEGRALS TO JOINT PROBABILITY DISTRIBUTIONS FOR X RAY STRUCTURE DETERMINATION Ph.D. Thesis
M. J. Kronenburg 5 Nov. 1992 89 p Sponsored by Netherlands Foundation for Chemical Research, and Nederlandse Organisatie voor WetenschAppelijk Onderzoek, The Hague Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-224152) Avail: CASI HC A05/MF A01

The physical theory of single crystal x-ray diffraction results in a Fourier transformation, as is demonstrated in section 1.1. Subject of the thesis is the derivation of joint probability distributions of the structure factors, and derivation of the corresponding estimates of invariants. The thesis provides a mathematical theory based on the maximum entropy method as applied in statistical gas theory. Using the maximum entropy method, combined with a mathematical tool from classical real gas theory, the irreducible cluster integrals, new expressions for joint probability distributions (jpd's) of invariant phase sums are derived. In chapter 2, a general outline of the standard derivation of jpd's is provided, and the importance of inequalities for jpd's is stressed. In chapter 3, Lagrange multipliers and general maximum entropy theory for continuous variables are introduced. In chapter 4, a theory for derivation of jpd's of structure factors based on maximum entropy theory is presented. In chapter 5, the normalization of crystallographic data is investigated in more detail. In chapter 6, the connection between jpd's and Patterson functions is stressed, and a new algorithm for iteratively finding better triplet values is outlined. NTIS

MODIFICATIONS TO 8X8 DYNAMICAL THEORY: POLARIZATIONS REDEFINED ACCORDING TO X RAY DIFFRACTION CONVENTION
A. T. Macrander and R. C. Blasdell Sep. 1993 9 p Presented at the Synchrotron Radiation Instrumentation, Gaithersburg, MD, 23-26 Aug. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-31-109-eng-38)
(DE94-001290; ANL/XFD/CP-80251; CONF-930824-13) Avail: CASI HC A02

Dynamical x-ray diffraction theory can be cast in matrix form. In recent years, an 8x8 matrix theory was developed that treated asymmetric reflections from strained crystals. The polarization of the incident, specularly reflected, reflected diffracted, transmitted diffracted, and transmitted electromagnetic wave fields were all defined as s or p. That is, polarizations were defined with respect to the plane containing the incident beam direction and the surface normal. The authors present modifications of the theory to treat (sigma) and (pi) polarizations for Bragg diffraction from asymmetric planes, that is, for polarizations defined with respect to the plane containing the incident beam direction and the reciprocal lattice vector for Bragg diffraction. They present results of this theory for unstrained crystals in the inclined geometry. In this geometry, the incident beam wavevector, the reciprocal lattice vector, and the surface normal are not coplanar. The inclined crystal geometry appears promising for use in a high-heat-load monochromator for undulator radiation at the Advanced Photon Source. As expected, they find a weak (pi)-polarization component in the diffracted beam when the polarization of the incident beam is pure sigma. DOE

PROPOSED ADDITIONS TO THE SHADOW RAY-TRACING CODE FOR GENERAL-ASYMMETRIC PERFECT-CRYSTAL OPTICS
R. C. Blasdell and A. T. Macrander Sep. 1993 14 p Presented at the Synchrotron Radiation Instrumentation, Gaithersburg, MD, 23-26 Aug. 1993 Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract W-31-109-eng-38)
(DE94-001291; ANL/XFD/CP-80250; CONF-930824-14) Avail: CASI HC A03

The dynamical theory of the diffraction of x-rays from perfect crystals is traditionally expressed in terms of Maxwell's equations using a semi-classical theory originally due to Ewald and von Laue. Combining the work of Batterman and Cole, Caticha and Caticha-Ellis, and Zachariasen, a formalism is obtained that treats the general asymmetric, thick and thin crystal, Laue and Bragg cases within the second order dispersion surface approximation. The authors have implemented this formalism with thick Bragg crystal E-field boundary value conditions in several routines they have added to one of the Advanced Photon Source (APS) versions of the SHADOW ray-tracing code in order to provide the ability to ray trace inclined double-crystal monochromators and high-resolution backscattering analyzers. These additions have been submitted to the University of Wisconsin Center for X-Ray Lithography for consideration for inclusion in the next version of SHADOW. DOE

GENERALIZED MELTING CRITERION FOR BEAM-INDUCED AMORPHIZATION
N. Q. Lam and Paul R. Okamoto Sep. 1993 22 p Presented at the 8th International Conference on Surface Modification of Metals By Ion Beams, Kanazawa, Japan, 13-17 Sep. 1993
(Contract W-31-109-eng-38)
(DE94-001333; ANL/MSD/CP-79942; CONF-9309251-1) Avail: CASI HC A03/MF A01

Recent studies have shown that the mean-square static atomic displacements provide a generic measure of the enthalpy stored in the lattice in the form of chemical and topological disorder, and that the effect of the displacements on the softening of shear elastic constants is identical to that of heating. This finding lends support to a generalized form of the Lindemann phenomenological melting criterion and leads to a natural interpretation of crystalline-to-amorphous transformations as defect-induced melting of metastable crystals driven beyond a critical state of disorder where the melting temperature falls below the glass-transition temperature. Application of the generalized Lindemann criterion to both the crystalline and amorphous phases indicates that the enthalpies of the two phases become identical when their shear moduli become equal. This thermoelastic rule provides a basis for predicting the relative susceptibility of compounds to amorphization in terms of their elastic properties as measured by Debye temperatures. The present approach can explain many of the basic findings on beam-induced amorphization of intermetallic compounds as well as amorphous phase formation associated with ion implantation, ion-beam mixing, and other solid-state processes. SENSORS FOR PROCESS CONTROL FOCUS TEAM REPORT
1993 10 p Presented at the Contamination Free Manufacturing Focus Technical Advisory Board Meeting, Austin, TX, 14-15 Jul. 1993
(Contract DE-AC04-76DP-00789)
(DE93-040897; SAND-93-1750C; CONF-9307140-1) Avail: CASI HC A02/MF A01

At the Semiconductor Technology Workshop, held in November 1992, the Semiconductor Industry Association (SIA) convened 179 semiconductor technology experts to assess the 15-year outlook for the semiconductor manufacturing industry. The output of the Workshop, a document entitled 'Semiconductor Technology: Workshop Working Group Reports,' contained an overall roadmap for the technology characteristics envisioned in integrated circuits (IC's) for the period 1992-2007. In addition, the document contained individual roadmaps for numerous key areas in IC manufacturing, such as film deposition, thermal processing, manufacturing systems, exposure technology, etc. The SIA Report did not contain a separate roadmap for contamination free manufacturing (CFM). A key component of CFM for the next 15 years is the use of sensors for (1) defect reduction, (2) improved product quality, (3) improved yield, (4) improved tool utilization through contamination reduction, and (5) real time process control in semiconductor fabrication. The objective of this Focus Team is to generate a Sensors for Process Control Roadmap. Implicit in this objective is the identification of gaps in current sensor technology so that research and development activity in the sensor industry can be stimulated to develop sensor systems capable of meeting the projected roadmap needs. Sensor performance features of interest include detection limit, specificity, sensitivity, ease of installation and maintenance, range, response time, accuracy, precision, ease and frequency of calibration, degree of automation, and adaptability to in-line process control applications. RESEARCH ON POLYCRYSTALLINE THIN-FILM CuInGaSe2 SOLAR CELLS
W. S. Chen, J. M. Stewart, R. A. Mickelsen, W. E. Devaney, and B. J. Stanbery Oct. 1993 25 p Prepared for Midwest Research Inst., Golden, CO
(Contract DE-AC02-83CH-10093)
(DE94-000203; NREL/TP-413-5835) Avail: CASI HC A03/MF A01

This report describes work to fabricate high-efficiency CdZnS/CuInGaSe2, thin-film solar cells and to develop improved transparent conductor window layers such as ZnO. The specific technical milestone for Phase 1 was to demonstrate an air mass (AM) 1.5 global 13% , 1-cm(exp 2) total-area CuInGaSe2 (CIGS) thin-film solar cell. For Phase 2, the objective was to demonstrate an AM1.5 global 13.5%, 1-cm(exp 2) total-area efficiency. We focused our activities on three areas. First, we modified the CIGS deposition system to double its substrate capacity. Second, we developed new tooling to enable investigation of a modified aqueous CdZnS process in which the goal was to improve the yield of this critical step in the device fabrication process. Third, we upgraded the ZnO sputtering system to improve its reliability and reproducibility. A dual rotatable cathode metallic source was installed, and the sputtering parameters were further optimized to improve ZnO's properties as a transparent conducting oxide (TCO). Combining the refined CdZnS process with CIGS from the newly fixtured deposition system enable us to fabricate and deliver a ZnO/Cd(0.08)Zn(0.20)S/CuIn(0.74)Ga(0.26)Se2 cell on alumina with I-V characteristics, as measured by NREL under standard test conditions, of 13.7% efficiency with V(proportional to) = 0.5458 V, J(sub sc) = 35.48 mA/cm(exp 2), FF = 0.688, and efficiency = 14.6%. DENSITY FUNCTIONAL STUDIES: FIRST PRINCIPLES AND SEMI-EMPERICAL CALCULATIONS OF CLUSTERS AND SURFACES Ph.D. Thesis
S. Susan 30 Apr. 1993 165 p
(Contract W-7405-eng-82)
(DE94-002836; IS-T-1649) Avail: CASI HC A08/MF A02

Theoretical electronic structure techniques are used to analyze widely different systems from Si clusters to transition metal solids and surfaces. For the Si clusters, first principles density functional methods are used to investigate Si(sub N) for N=2-8. The goal is to understand the different types of bonding that can occur in such small clusters where the atomic coordination differs substantially from tetrahedral bonding; such uncoordinated structures can test approximate models of Si surfaces. For the transition metal systems, non-self-consistent electronic structure methods are used to understand the driving force for surface relaxations. In-depth analysis of results is presented and physical basis of surface relaxation within the theory is discussed. Limitations inherent in calculations of metal surface relaxation are addressed. Finally, in an effort to understand approximate methods, a novel non-self-consistent density functional electronic structure method is developed that is about 1000 times faster than more sophisticated methods; this method is tested for various systems including diatomics, mixed clusters, surfaces, and bulk lattices. Ga DELTA-DOPING LAYERS IN SILICON Ph.D. Thesis
P. M. Zagwijn 22 Feb. 1993 100 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-224632) Avail: CASI HC A05

Experimental studies of Ga delta-doping layers in silicon are described. The layers are mainly investigated by medium-energy ion scattering (MEIS). The measurement technique is greatly improved by the introduction of a new detection system for backscattered ions. In Chapter 1 the subject of delta-doping layers is introduced and the principles of MEIS are discussed. Compared with other surface science measurements techniques, it is shown that MEIS is an excellent technique to measure delta-doping profiles with high depth resolution. The design and the performance of the detection system are described in Chapter 2. Chapter 3 describes the fabrication of a Ga delta-doping layer in Si using a solid phase epitaxial growth (SPEG) method. The growth method is followed step-by-step by MEIS. In Chapter 4 the redistribution of Ga in amorphous silicon (a-Si) is investigated by MEIS. In Chapter 5 the incorporation of Ga in crystalline Si (c-Si) during the fabrication of delta-doping layers is studied in more detail. With the preparation method described, it is possible to bury a delta-doping Ga layer deep inside a Si crystal. NTIS

MAGNETIC RESONANCE STUDY OF ZINC-RELATED DEFECTS IN SILICON WITH OPTIMIZED EPR SPECTROMETER Ph.D. Thesis
H. E. Altink 25 Feb. 1993 116 p
(PB93-224640) Avail: CASI HC A06/MF A02

The work described can be divided into two major parts: the construction of a very sensitive electron paramagnetic resonance (EPR) spectrometer and EPR investigations with this spectrometer of silicon samples doped with zinc. In Chapter 1 the construction of the spectrometer is described where a lot of attention is paid to the noise sources and these were, where possible, removed or minimized. In Chapter 2 an overview of the electron nuclear double resonance (ENDOR) method is given. This method was not used in the investigations described. The work on zinc-related defects starts in Chapter 3 where the early results are presented and the chemical identification of two of these centers Si:ZnCu and Si:ZnCr are given. Chapter 4 is a review of the double acceptor zinc in silicon and data like solubility, diffusion, ionization levels, and acceptor states are given. In Chapter 5 the photo-EPR method is described, which in principal can give information of the energy level, and electron (or hole) capture processes, of the paramagnetic center under study. In Chapter 6 all new paramagnetic centers, that were found during these investigations are given in much more detail including details of the sample preparations. NTIS

CONDUCTORS WITH SMALL FERMI ENERGIES AND SMALL GAP ENERGIES
R. J. Thorn 1993 16 p
(Contract W-31-109-eng-38)
(DE93-040887; ANL/CHM/PP-77001) Avail: CASI HC A03/MF A01

If the Fermi energy is of the order of meV's, the usual treatment of the density of free electrons is not valid, but use can be made of an averaged density of states that depends weakly on temperature, so that the temperature variation of the conductivity can be expressed by the equation: sigma is approximately CT(exp 1-s) 1n(((exp ((beta)E(sub f)) + 1)/2)(exp -(beta)(E(sub g) - E(sub f)) + 1)) in which E(sub f) is the Fermi energy, E(sub g) is the top of the energy gap for thermal activation, and s is the exponent of the temperature-dependent scattering. This equation serves to define a class of solids consisting of a microcomposite with a narrow conduction band for which E(sub f) of the order of ceV's or less and a thermal activated conduction for which E(sub g) is of the order of ceV's. It describes quantitatively the conductivity, (sigma)(T;(Delta)), for YBa2Cu3O(7-delta) and (sigma)(T;p) as the hydrostatic pressure p is varied for (kappa)-(BEDT-TTF)(sub 2)CuN(CN)(sub 2)Br. DOE

OBSERVATION OF NON-CENTROSYMMETRY AND DETERMINATION OF POLARITY IN III-V SEMICONDUCTORS
K. Marthinsen and R. Hoeier (Norges Tekniske Hoegskole, Trondheim.) 8 Dec. 1992 5 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-201416; STF19-A92018) Avail: CASI HC A01

A simple method for determining polarity in III-V semiconductors is considered. It is based on comparison of two conjugate four-beam CBED patterns tilted away from the (011) zone axis. It is shown that with carefully chosen diffraction conditions strong effects of non-centrosymmetry may be observed both for GaAs and InP, and the polarity can be uniquely determined. The general conditions for strong asymmetry effects are that the structure factor magnitudes of the reflections involved are of the same size, and that the three-phase invariants involved are as close to + or - pi/2 as possible. The asymmetry effect is rather insensitive to thickness, but weakens as the thickness approaches the extinction lengths of the reflections involved. It is shown that the 200 structure factor for GaAs (sensitive to bonding) may be determined from the gap between the black lines in one of the 200 disks, if the other parameters can be controlled. However, the 200 structure factor is probably equally well determined from the strong variations in 2,0,0 oscillations itself using recently developed quantitative CBED methods. NTIS

CHARACTERIZATION OF 3-D PARTICLE DISTRIBUTIONS AND EFFECTS ON RECRYSTALLIZATION STUDIED BY COMPUTER SIMULATION

J. M. Fridy (Aluminum Co. of America, Alcoa Center, PA.), K. Marthinsen, T. N. Rouns (Aluminum Co. of America, Alcoa Center, PA.), K. B. Lippert (Aluminum Co. of America, Alcoa Center, PA.), and E. Nes (Norges Tekniske Hoegskole, Trondheim.) 8 Dec. 1992 10 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-201408; STF19-A91017) Avail: Issuing Activity (National Technical Information Service (NTIS))

Artificial particle distributions in three dimensions with different degree of clustering have been generated and used as nucleation sites for the simulation of particle stimulated recrystallization with site saturation nucleation kinetics. The clustering has a strong effect on both the Avrami exponent and the resulting sectioned grain size distributions. The Avrami exponent decreases rapidly from the expected value of 3 with the degree of clustering. A value of less than 1.5 is obtained for the Avrami exponent with a strongly clustered distribution of nucleation sites. The size distributions of sectioned grain areas are considerably broadened with clustering, but are still far from the log-normal distributions observed experimentally. A computer program has been developed to generate particle distributions whose pair correlation functions (PCF) match experimentally measured PCF's. The procedure has been applied to an H19 gauge Al-alloy similar to 3004. The PCF's calculated exhibited clear anisotropy, especially in the longitudinal direction. However, when the particle distribution was used to define nucleation sites for the recrystallization simulations, the effects on the kinetics and resulting grain size distribution was not significantly different from random site saturated results. PARTICLE SIZE MEASUREMENT FOR THE CONTROL OF INDUSTRIAL CRYSTALLIZERS Ph.D. Thesis

A. Boxman 1992 186 p
(PB94-119104; ISBN-90-6275-790-1) Copyright Avail: CASI HC A09/MF A02

The need for on-line sensors to monitor particulate processes is rapidly increasing. Such systems are a necessity to understand the complex phenomena of particle formation, growth, and breakage. Some aspects of the design of an on-line sensor for particle size analysis are discussed. The technique used is based on forward light scattering, which covers a size range from about 1 to 2,000 micrometers. The observations are used to develop a physical model and subsequently an effective control strategy for a 970 liter continuous crystallizer. The purpose of the controller is to manipulate the dynamics of the size distribution. Therefore, a firm relation between process inputs and outputs (i.e., the crystal size distribution) must first be established. Secondly, an intelligent interpretation of the recorded data, in this case a light scattering pattern, is required. Chapter headings include the following: Validation of Light Scattering Models for Polydisperse Particle Systems; Deconvolution Algorithm for the Recovery of Particle Size Distributions; Automated Measurement and Interpretation of Scattering Patterns; On-line Measurement of Crystal Size Distribution in Industrial Crystallizers. EXACT TRANSFORMATION OF THE ANISOTROPIC GINZBURG-LANDAU MODEL AND ITS CONSEQUENCES

R. A. Klemm Oct. 1993 50 p Presented at the Joint Summer Research Conferences in the Mathematical Sciences: Mathematics of Superconductivity, Seattle, WA, 24-30 Jul. 1993
(Contract W-31-109-eng-38)
(DE94-002208; ANL/MSD/CP-81086; CONF-930738-1) Avail: CASI HC A03/MF A01

Line energy of a single magnetic vortex at an arbitrary direction in an anisotropic superconductor is evaluated in three different phenomenological models: anisotropic London, anisotropic Ginzburg-Landau, and Lawrence-Doniach models. Vortex line energy in anisotropic London can be solved by Fourier transformation, but core cutoff is not present. Using the Klemm-Clem transformations of the free energy and vortex coordinates in the anisotropic Ginzburg-Landau model, a theorem relating shape of effective core cross-section in anisotropic London model to that in anisotropic Ginzburg-Landau model is presented. This theorem allows the anisotropic London model to be used in the entire regime H(sub c1) less than or equal to H much less than H(sub c2) regardless of anisotropy and field direction. Resulting lower critical field H(sub c1) ((theta)(sub H)) can exhibit a discontinuity, a kink, or monotonic angular dependence. The transformations are applied to the case of a core cross-section of a single vortex in Lawrence-Doniach model, and angular dependence of magnetic torque is calculated. The torque exhibits the expected dimensional crossover, having an angular dependence which reduces to an anisotropic Ginzburg-Landau superconductor near Tc, and to a lattice of decoupled, parallel Josephson junctions well below dimensional crossover temperature T*. In the vicinity of T*, however, dramatic oscillations in angular dependence of torque are predicted. DOE

PULSED ION BEAM SURFACE ANALYSIS (PIBSA) AS A MEANS OF IN-SITU REAL-TIME ANALYSIS OF THIN FILMS DURING GROWTH

A. R Krauss, G. J. Lamich, D. M. Gruen, Y. Lin, R. P. H. Chang (Northwestern Univ., Evanston, IL.), O. Auciello (Microelectronics Center of North Carolina, Research Triangle Park.), and J. A. Schultz (Ionwerks, Houston, TX.) 1993 23 p Presented at the 40th National Symposium of the American Vacuum Society (AVS), Orlando, FL, 15-19 Nov. 1993
(Contract W-31-109-eng-38)
(DE94-001276; ANL/CHM/CP-80915; CONF-9311104-1) Avail: CASI HC A03/MF A01

Low energy (5-15 keV) pulsed ion beam surface analysis (PIBSA) comprises several different surface spectroscopies which provide a wide range of information relevant to growth of single and multi-component semiconductor, metal, and metal oxide thin films and layered structures. Ion beam methods have not been widely used as an in-situ monitor of thin film growth. PIBSA was developed as a non-destructive, in-situ, real-time probe of thin film composition and structure which does not physically interfere with deposition. Several PIBSA versions are exceptionally surface-specific, yet can yield high resolution data at ambient pressures in excess of 1 m Torr (4-5 orders of magnitude higher than conventional surface analytic methods). Therefore, PIBSA is ideal for studying ultra-thin layers and atomically abrupt interfaces. PIBSA instrumentation designed for use as an in-situ, real-time monitor of growth processes for single and multi-component thin films and layered structures is described. Representative data are shown for in-situ analysis of Pb and Zr layers at room temperature and high vacuum, as well as under conditions for growth of PZT perovskite films on MgO and RuO2 substrates. Silicon and metal are coevaporated onto a silicon substrate in a molecular beam epitaxy system with a larger than stoichiometric amount of silicon so as to epitaxially grow particles of metal silicide embedded in a matrix of single crystal epitaxially grown silicon. The particles interact with incident photons by resonant optical absorption at the surface plasmon resonance frequency. Controlling the substrate temperature and deposition rate and time allows the aspect ratio of the particles to be tailored to desired wavelength photons and polarizations. The plasmon energy may decay as excited charge carriers or phonons, either of which can be monitored to indicate the amount of incident radiation at the selected frequency and polarization. INVESTIGATION OF THE OPTICAL AND LASER PROPERTIES OF Tm AND Ho IN YAG ANF YLF Final Report
Alexey A. Nikitichev (Academy of Sciences, USSR, Saint Petersburg.) Jan. 1994 37 p
(Rept-94-001) Avail: CASI HC A03/MF A01

The spectral-luminescence and laser properties of YAG and YLF crystals doped with Ho(3+) and Tm(3+) as active media for diode pumped lasers are examined. The processes of nonradiative excitation energy transfer (self-quenching sensitization and upconversion) providing the inverse population of working levels are studied. The intensity parameters are calculated for the YLF: Tm Crystal using the Judd-Offelt method. The energy transfer processes are experimentally studied in Ho(3+) and Tm(3+) doped YAG and YLF crystals. The spectroscopic amplifier model at laser diode pumping is proposed and optimization of the Ho(3+) and Tm(3+) concentrations is made. Author

THE MECHANICAL PROPERTIES OF SINGLE CRYSTAL (ALPHA)-SI3N4
I. E. Reimanis, H. Suematsu, J. J. Petrovic, and T. E. Mitchell 1993 8 p Presented at the 1st Meeting of the Pacific Rim Ceramic Societies, Honolulu, HI, 7-10 Nov. 1993
(Contract W-7405-eng-36)
(DE94-002632; LA-UR-93-3531; CONF-931142-3) Avail: CASI HC A02/MF A01

The ambient and high temperature mechanical properties of single crystal alpha-Si3N4 synthesized by chemical vapor deposition are reported. Crack patterns in the as-grown crystals and around Vicker's indentations reveal that significant residual stresses develop during growth. Indentation studies indicate that the cleavage is essentially isotropic in alpha-Si3N4 at 25 C as well as at 1400 C. Transmission electron microscopy on crystals deformed at high temperatures, confirmed previous observation that high-temperature slip occurs primarily on the (1011)(bracket)1120(bracket) system. DOE

(Contract DE-FG02-85ER-13438)
(DE94-001727; DOE/ER-13438/T1) Avail: CASI HC A02

A critical theme has been to understand the role of intrinsic cyanometalate overlayers in modulating interfacial photoinduced charge transfer processes occurring at the Cd chalconide/aqueous ferri-ferrocyanide interface. Structural and charge transfer studies of (CdFe(CN)(sub 6))(sup 2-/1-) overlayers have been undertaken. It is reiterated that the focus of attention on the Cd ferrocyanide overlayer as a critical element in II-VI semiconductor based photoelectrochemical cells, is correct. A new project on metallization of solid supports, using photodeposition of Pt, has been initiated. A project has also been started in the area of visible light, molecular, charge transfer photochemistry. DOE

THE TORSION SPACE NUCLEIC ACIDS MOLECULAR MECHANICS PROGRAM DUPLEX: SURVEYING CONFORMATION SPACE BY POTENTIAL ENERGY MINIMIZATION
B. E. Hingerty and S. Broyde (New York Univ., New York.) 1993 11 p Presented at the 8th Conversation in the Discipline Biomolecular Stereodynamics, Albany, NY, Jun. 1993
(Contracts DE-AC05-84OR-21400; DE-FG02-90ER-60931)
(DE94-002441; CONF-9306237-4) Avail: CASI HC A03/MF A01

It has been 21 years since the inception of the program DUPLEX. Now that 'molecular modeling' (encompassing quantum mechanics, molecular mechanics and dynamics, and computer graphics) has become something of a trade, the time seems ripe for us to offer a brief perspective of our efforts since the beginnings of the field. The purpose in writing the program was to solve the crystal structure of Ca(++)-GpC, an RNA subunit for which x-ray diffraction data had been collected by T. Sato. No trial structure was available to aid us in solving the phase problem in the Fall of 1972, and we hoped to generate one by potential energy minimization. We hoped to compute not only the conformation of the GpC molecule, but also its packing scheme in the unit cell, a feat that had never before been performed for a nucleic acid subunit. Indeed, only one dinucleoside monophosphate crystal structure, that of UpA, had been previously solved, and its structure was very different from that of GpC. DOE

DIRECT OBSERVATION OF CRYSTAL GROWTH FROM SOLUTION USING OPTICAL INVESTIGATION OF A GROWING CRYSTAL FACE Annual Technical Report No. 1, 1 Jan. - 31 Dec. 1993
Ravindra Lal Feb. 1994 22 p
(Grant NAG3-1429)
(NASA-CR-195141; NAS 1.26:195141) Avail: CASI HC A03/MF A01

The first technical report for the period 1 Jan. 1993 till 31 Dec. 1993 for the research entitled, 'Direct observation of crystal growth from solution using Optical Investigation of a growing crystal Face' is presented. The work on the project did not start till 1 June 1993 due to the non-availability of the required personnel. The progress of the work during the period 1 June 1993 till the end of 1993 is described. Significant progress was made for testing various optical diagnostic techniques for monitoring crystal solution. Some of the techniques that are being tested are: heterodyne detection technique, in which changes in phase are measured as a interferometric function of time/crystal growth; a conventional technique, in which a fringe brightness is measured as a function of crystal growth/time; and a Mach-Zehnder interferometric technique in which a fringe brightness is measured as a function of time to obtain information on concentration changes. During the second year it will be decided to incorporate the best interferometric technique along with the ellipsometric technique, to obtain real time in-situ growth rate measurements. A laboratory mock-up of the first two techniques were made and tested. Author (revised)

THERMOMECHANICAL PROCESSING OF Ag-CLAD Bi2Sr2CaCu2O(x) SUPERCONDUCTORS
C. T. Wu, K. C. Goretta, M. T. Lanagan, A. C. Biondo, and R. B. Poeppel Oct. 1993 13 p Presented at the Fall Meeting of the Minerals, Metals and Materials Society: Physical Metallurgy and Materials, Pittsburgh, PA, 17-21 Oct. 1993
(Contract W-31-109-eng-38)
(DE94-002347; ANL/ET/CP-78614; CONF-931009-8) Avail: CASI HC A03/MF A01

Bi2Sr2CaCu2O(x) (2212) powders were synthesized by solid-state reaction, loaded into Ag tubes, and processed into tapes by various combinations of drawing, rolling, and heat treatment. Critical current densities at 4.2 K of greater than 10(exp 5) A/sq cm were achieved from microstructures consisting of large, highly textured 2212 grains. Optimal microstructures were produced by specific mechanical-working conditions and heat-treatment schedules that incorporated solid-state and partial-melt sintering. The relationships between processing, microstructure, and critical current density are discussed. DOE

Ge-Au EUTECTIC BONDING OF Ge (100) SINGLE CRYSTALS
W. B. Knowlton, J. W. Beeman, J. H. Emes, D. Loretto, K. M. Itoh, and E. E. Haller Aug. 1993 6 p Presented at the 5th International Workshop on Low Temperature Particle Detectors, Berkeley, CA, 29 Jul. - 3 Aug. 1993
(Contract DE-AC03-76SF-00098)
(DE94-002281; LBL-34447; CONF-930751-1) Avail: CASI HC A02/MF A01

We present preliminary results on eutectic bonding between two (100) Ge single crystal surfaces using thin films of Au ranging from 900 A/surface and Pd (10% the thickness of Au). Following bonding, plan view optical microscopy (OM) of the cleaved interface of samples with Au thicknesses less than or = 500 A/surface show a eutectic morphology more conducive to phonon transmission through the bond interface. High resolution transmission electron microscopy (HRTEM) cross sectional interface studies of a 300 A/surface Au sample show group of zone axes (100) epitaxial growth of Ge. In sections of the bond, lattice continuity of the Ge is apparent through the interface. TEM studies also reveal group of zone axes (110) heteroepitaxial growth of Au with a Au-Ge lattice mismatch of less than 2%. Eutectic bonds with 200 A/surface Au have been attained with characterization pending. An optical polishing technique for Ge has been optimized to insure intimate contact between the Ge surfaces prior to bonding. Interferometry analysis of the optically polished Ge surface shows that surface height fluctuations lie within +/- 150 A across an interval of 1 mm. Characterization of phonon transmission through the interface is discussed with respect to low temperature detection of ballistic phonons. DOE

INFLUENCES OF NITROGEN ABSORPTION ON THE MAGNETIC PROPERTIES OF YFe2, YFe3 AND Y6Fe23
Isao Yamamoto, Fumitaka Sugaya, Satoshi Takabatake, Masuhiro Yamaguchi, Tsuneaki Goto, and Mikhail I. Bartashevich Feb. 1993 32 p Sponsored by Ministry of Education, Science and Culture, Tokyo, Japan and Inoue Science Foundation, Tokyo, Japan
(Rept-A-2654; JTN-94-80525) Avail: CASI HC A03/MF A01

The formation of the nitrides YFe2N(x), YFe3N(x) and Y6Fe23N(x) and their magnetic properties have been investigated. The nitrides are formed up to the composition of YFe2N(0.3), YFe3N(0.4) and Y6Fe23N6, retaining the original crystal structures. For all the compounds, nitrogen absorption leads to an apparent decrease in the low-field magnetization, whereas the Fe moment in high magnetic fields is not changed at all. The Curie temperature is almost independent of the nitrogen concentration although it varies by less than 1 percent. Anomalous dips in the magnetization-temperature curves occur around 230 K for Y6Fe23N(x) and around 200 K for YFe3N(x). These two nitrides also exhibit metamagnetic transitions at low temperatures. For Y6Fe23N5 the critical temperature above which the metamagnetism disappears is 250 K. The nitrogen-induced changes in the magnetic properties are explained by the modification of exchange interactions or the occurrence of strong local anisotropy. Author (NASDA)

THE ROLE OF EMITTER STATES IN MAGNETOTUNNELING THROUGH DOUBLE-BARRIER RESONANT-TUNNELING DIODES AT HIGH MAGNETIC FIELDS
Norihiko Kamata, Koji Yamada, Noboru Miura, and Laurence Eaves Mar. 1993 31 p
(Rept-A-2658; JTN-94-80529) Avail: CASI HC A03/MF A01

By applying pulsed high magnetic fields up to 40 T perpendicular (B(sub perpendicular)) and parallel (B(sub parallel) is parallel to I) to the current direction, a distinct role of emitter states in the magneto-tunneling processes through resonant tunneling diodes has been investigated. The B(sub perpendicular) dependence of the threshold voltage in current vs. voltage (one - five) curves has been explained consistently by tunneling from a combined magneto-electric state of a one-dimensional (1 D) emitter to that of a zero-dimensional (0 D) m well state. A drastic current decrease above B(sub parallel) = 10 T under constant applied voltage below the negative differential conductivity region together with multi-peaked one - five curves with hysteresis at above B(sub parallel) = 30 T was observed. These distinct features were analyzed by a self-consistent model of the charge build-up effect and the energy configuration of the 0 D emitter, 1 D emitter and 0 D well states. Author (NASDA)

GGA STUDY OF THE MAGNETIC AND COHESIVE PROPERTIES OF bcc, fcc AND hcp Mn
Toshio Asada and Kiyoyuki Terakura Mar. 1993 17 p Sponsored by Ministry of Education, Science and Culture, Tokyo, Japan
(Rept-A-2662; JTN-94-80533) Avail: CASI HC A03/MF A01

Magnetic and cohesive properties of bcc (body centered cubic), fcc (face centered cubic), and ideal hcp (hexagonal closest packing) Mn are calculated by use of the Generalized Gradient Approximation (GGA) proposed by Perdew and Wang. Calculated results predict correctly an antiferromagnetic ground state for the fcc structure with lattice constant and magnetic moment in good agreements with experimental values. Investigation of the contribution to the free energy from lattice vibration by use of quasi-harmonic approximation removes apparent difficulties involving an hcp ground state in the calculated total energies of three structures. ON SUPERCONDUCTIVITY OF ALPHA-(BEDT-TTF)2KHg(SCN)4
Hiroshi Ito, Hiroshi Kaneko, Takehiko Ishiguro, Hidehiko Ishimoto, Kimitoshi Kono, Sachio Horiuchi, Tokutaro Komatsu, and Gunji Saito Mar. 1993 18 p Sponsored by Ministry of Education, Science and Culture, Tokyo, Japan
(Rept-A-2660; JTN-94-80531) Avail: CASI HC A03/MF A01

The resistivity decrease in alpha-(BEDT (Bis(ethyleneclithio)) - TTF (Tetrathiafulvalene)) 2KHg(SCN)4 appearing in the temperature region below 300 mK was found to be suppressed by a magnetic fields of less than 0.1 T. The decrease in resistivity is due to the superconductivity occurring in a fibril-like structure. The observed behavior is in part due to the inhomogeneous molecular arrangement, but is also related to the subtle interplay between magnetism and superconductivity in this system. Author (NASDA)

EXCITED STATE DYNAMICS OF THULIUM IONS IN YTTRIUM ALUMINUM GARNETS
G. Armagan, A. M. Buoncristiani, and B. DiBartolo (Boston Coll., Chestnut Hill, MA.) 1991 10 p Repr. from Optic Materials (Elsevier Science Publishers B.V.) p 1-10
(Grants NAG1-796; NAG1-955)
(NASA-CR-195159; NAS 1.26:195159) Copyright Avail: CASI HC A02/MF A01

The processes that take place in the excited states of a trivalent Thulium (Tm) ion in an Yttrium Aluminum Garnet (YAG) crystal, being relevant to the use of this system for laser applications, have been the object of several studies. We have reexamined this system focusing our attention on the dynamics of Tm following its excitation in the H-3(sub 4) level. Under these conditions the system relaxes through a cross-relaxation process. H-3(sub 4) yields F-3(sub 4), H-3(sub 6) yields F-3(sub 4), whose rate depends upon both the concentration of the Tm ion and the temperature of the crystal. The excitation spectrum obtained by monitoring the 1.8 micron emission of Tm (due to the F-3(sub 4) yields H-3(sub 6) transition) indicates an increase in the contribution to this emission from the H-3(sub 4) level relative to the H-3(sub 5) level as the Tm concentration increases; this shows the increased role played by the H-3(sub 4) level in pumping the infrared emission. Correspondingly, the duration of the luminescence originating in the H-3(sub 4) level is shortened as the concentration of Tm increases. The concentration quenching of this lifetime can be fit to a model which assumes that the cross-relaxation is due to a dipole-dipole interaction; from this fit, the intrinsic Tm lifetime in the absence of cross relaxation can be derived. We have used this lifetime to calculate the rate of the cross-relaxation process. We have evaluated this rate as a function of the temperature and found it to be fastest at 77 K. We have also calculated the microscopic interaction parameters for the cross-relaxation process by using two independent experimental features: (1) the time evolution of the emission from the H-3(sub 4) level; and (2) the spectral overlap between the H-3(sub 4) yields F-3(sub 4) emission and the H-3(sub 6) yields F-3(sub 4) absorption. We have also considered the migration of excitation among the Tm ions in the F-3(sub 4) level and calculated the relevant microparameter by the use of the relevant spectral overlap. The data are consistent with the model in which the Tm ions, once excited into the H-3(sub 4) level decay by cross-relaxation to the F-3(sub 4), and then transfer rapidly their energy to other Tm ions. TWO MICRON STIMULATED EMISSION OF ACTIVATED INSULATING CRYSTALS

Alexander A. Kaminskii (Academy of Sciences, USSR, Moscow.) Jan. 1994 13 p

(Rept-94-002) Avail: CASI HC A03/MF A01

Two micron stimulated emission (SE) has potential for a variety of applications due to its relatively low physiological activity. Since the end of the 1960's, our laboratory has carried out systematic studies of crystalline laser materials that are suitable for 2 micron SE generation. Most of the research has focused on the generating properties of Ho(sup 3+), Tm(sup 3+), and Er(sup 3+) activator ions in different oxide and fluoride crystals with ordered and disordered structures. The crystals that were used in the spectroscopic and laser experiments were grown from the melt. Garnet Gd3Ga5O12 single crystals were grown by the Czochralski method using iridium crucibles. Alumina based crystals--garnets and perovskites--and fluoride crystals were grown by the Bridgman-Stockbarger method using molybdenum and graphite containers, respectively. A fluoridizing atmosphere was used for the latter processes. Two micron SE of these ions was realized by using new laser-action excitation schemes as well as through different laser pumping methods. This symposium showcased the advancement in processing technology and basic scientific understanding of ferroelectric thin films. The conference highlighted the use of novel material science analysis techniques to characterize ferroelectric thin film materials and devices and to relate the nanoscale features and responses detected by these techniques to ferroelectric, electrooptic, and piezoelectric properties. Examples of newer material analysis techniques included atomic force microscopy, electron spin resonance, high resolution transmission electron microscopy, combined Rutherford backscattering-nuclear reaction analysis, and the use of optical interferometry to provide a three dimensional representation of field induced displacement. QUANTUM TUNNELING TRANSPORT OF ELECTRONS IN DOUBLE-BARRIER HETEROSTRUCTURES: THEORY AND MODELING Ph.D. Thesis

Henricus Joseph Mari Noteborn 1993 177 p Sponsored by Netherlands Organization for the Advancement of Scientific Research

(ETN-94-95332) Avail: CASI HC A09/MF A02

The Double Barrier Resonant Tunneling (DBRT) diode model chosen to describe the heterofunction superlattices having two or more barriers is presented. Both the charge accumulation and depletion in the electrodes and the electrostatic feedback due to charge storage in the well are studied. The coherent tunneling method is described. Special emphasis is given to the determination of the position and width of the transmission peak. The theoretical background for the wave mechanical approach to tunneling in semiconductors is provided. Applications of the DBRT model are given. The stability of the current solutions obtained from the static model, its relation to the DBRT impedance, and the equivalent circuit that describes the diode are discussed. The application of quantizing magnetic fields, both perpendicular and parallel to the barriers, are covered. ESA

SIMULATION STUDIES FOR SURFACES AND MATERIALS STRENGTH Final Technical Report, 1 May 1984 - 31 Jan. 1994

Timur Halicioglu and Grant D. Smith 7 Mar. 1994 14 p

(Contract NCC2-297)

(NASA-CR-195185; NAS 1.26:195185) Avail: CASI HC A03/MF A01

Computer simulation studies were conducted to investigate materials properties. All the calculations were carried out using atomic level simulation techniques which are based on semiempirical or model functions. During this project, functions with varying degrees of complexity were derived and employed in simulations. Investigations include covalently bonded materials as well as systems involving metal atoms. For small clusters calculated results provided information on various energy- and structure-related properties along with vibrational characteristics. Also, energy barriers for configurational transitions were calculated for selected cases. Simulation calculations for surfaces produced new results in areas related to surface energies, reconstructions and relaxations, surface defects, surface stresses as well as adsorption and nucleation processes. Simulations were also performed on bulk materials. Calculated results provided an atomic level understanding on energetics and structures of point defects, crystal stability, elastic properties, and materials strength for various systems. Calculations involving polymeric materials include studies of polar polymer melts and polymer/solid interfaces. Simulations employing specially developed codes provided significant information about energetics and conformational characteristics of different polymeric chains. Author (revised)

TUNNELLING IN METALLIC CONTACTS ON HIGH-T(c) SUPERCONDUCTORS: A STORY OF CHARGE CARRIERS IN YBa2Cu3O(7-DELTA) AND Bi2CaSr2Cu2O(8+DELTA) Ph.D. Thesis

Henk Jan vanSchevicoven 1992 148 p Sponsored by Netherlands Foundation for Technical Sciences

(ISBN-9-03-860142-5; ETN-94-95304) Avail: CASI HC A07/MF A02

Electrical properties of contacts fabricated on the surface layer of polycrystalline YBCO and of single crystalline BiCaSCO are described. For polycrystalline YBCO pellets several fabrication methods are described, but only one method, silver paint on a gold layer deposited on the pellet, resulted in contacts yielding reproducible electrical characteristics after several thermal cycles of cooling down to 4.2K and warming up to room temperature. Other methods, such as bonding or (mechanical) point contacts, had the disadvantage of damaging the surface layer. The contacts to YBCO are relatively high ohmic and the associated voltages therefore are relatively high. As a result superconductive features are not visible. In fact, a model describing the contact as an N-I-N junction, predicts I-V curves that are in good agreement with the experiments, even though totally disregarding superconductivity. In contrast to the YBCO measurements, single crystalline BiCaSCO yields contacts that are relatively low ohmic. Superconductive features then become evident. The model used to describe the contacts of YBCO is extended to include Andreev reflection. This enables good agreement to be obtained with most of the electrical characteristics of contacts to BiCaSCO, but not with all. The merits of this model are critically evaluated. The main differences and similarities between contacts fabricated on the two superconductors are summarized. ESA

IMAGE ANALYSIS TECHNOLOGY APPLIED TO PROBLEMS IN CRYSTALLOGRAPHY Final Report, 1 Jul. 1991 - 30 Jun. 1992
Daniel Gordon 30 Jun. 1993 8 p
(Contract F49620-91-C-0058)
(AD-A273516; AFOSR-93-0865TR) Avail: CASI HC A02/MF A01

This work summarizes the procedures accomplished toward the objective of developing a demonstration capability (Proof-of-Concept) of three dimensional object modeling using close range photogrammetric techniques. Static stereo views and three-dimensional perspective scenes of crystals were to be developed using the same technology that is applied in displaying three dimensional earth surfaces. The work included the creation of close range photogrammetric capabilities to work along with various existing display capabilities. The imagery for this project was provided by the 3M Co. It was acquired using a Scanning Electron Microscope (SEM). The softcopy concept was demonstrated to the Office of Commercial Programs National Aeronautics and Space Administration at Autometric (Alexandria, VA headquarters). DTIC

ON THE ORIGIN OF 1/f NOISE IN EPITAXIAL GaAs Ph.D. Thesis
Lin Ren 1993 110 p Sponsored by Netherlands Organization for the Advancement of Scientific Research Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ISBN-9-09-006067-7; ETN-94-95334) Avail: CASI HC A06

A series of papers covering investigations into electrical 1/f noise is presented. Experimental results of 1/f noise and its temperature dependence in epitaxial n-GaAs, with the thickness and the dope concentration as parameters, are presented. A study of 1/f noise in Hall voltage of molecular beam epitaxy (MBE) grown n-GaAs is presented. A study of low frequency noise in electron irradiated n-GaAs epitaxial layers is presented. For the interpretation a simple formalism was needed which is presented. Investigations of 1/f noise in proton irradiated n-GaAs epitaxial layers are reported. A study of 1/f noise in an Al(x)Ga(1-x)As/GaAs heterostructure with a two dimensional gas is presented. ESA

INVESTIGATION OF THE SOLID-SOLID SURFACE ADSORPTION OF Eu2O3 ON AMORPHOUS Al2O3
Rong-Chuan Liu (Nanjing Univ., China.), Qi-Jie Yan (Nanjing Univ., China.), Hai-Hua Qi (Nanjing Univ., China.), Yuan-Fu Xia (Nanjing Univ., China.), Ya Zhai, J. Jiang (Saarland Univ., Saarbrucken, Germany.), and U. Gonser (Saarland Univ., Saarbrucken, Germany.) Nov. 1991 14 p
(DE93-613824; CNIC-00567; NU-0007) Avail: CASI HC A03/MF A01 (US Sales Only)

Solid-solid surface adsorption of Eu2O3 of amorphous Al2O3 was investigated by Moessbauer spectroscopy, x-ray diffraction analysis, and a Laser Raman Spectra. No x-ray diffraction peak of crystalline Eu2O3 can be found for all samples studied. With increasing Eu2O3 content the isomer shift and line width increase continuously and gradually approach to those of bulk Eu2O3. The Laser Raman Spectra show that two peaks at 998 and 1051 cm(exp -1) assigned to two-dimensional surface europium-oxygen species appear at Eu2O3 content of 18.7 wt.%. The peak at 1068 cm(exp -1) due to the surface species and another peak at 342 cm(exp -1) due to crystalline Eu2O3 content start to appear for the sample with Eu2O3 content of 36.5 wt.%. The dispersity of Eu2O3 on the surface of amorphous Al2O3 was compared with that of gamma-Al2O3, eta-Al2O3 and SiO2 gel. The change of isomer shift for the different support results from their distinct electronegativity. The results of these studies indicate that the structure of Eu2O3 dispersed onto the support surface depends on the structure of support and that there is an inductive effect of support on the structure of the Eu2O3. DUAL-PURPOSE RTOF DIFFRACTOMETER FACILITY AT THE ET-RR-1 REACTOR
R. M. A. Maayouf, P. E. Hiismaeki, O. K. Antson, and A. T. Tiitta Nov. 1992 17 p
(VTT-TIED-1425; ISBN-9-51-384319-X; ETN-94-95257) Copyright Avail: CASI HC A03/MF A01

The reverse time of flight (RTOF) diffractometer facility, to be installed at the ET-RR-1 reactor, is discussed. The facility is a dual purpose instrument: it can be used for high resolution crystallography utilizing transmission diffraction technique and for strain measurements of technical components using a scattering geometry with a detector at 90 degrees. The RTOF diffractometer is an efficient tool for basic and applied research in material science. The proposed device allows transmission diffractometry and strain measurements. The resolution level at d equal to 2 angstroms for the transmission diffractometry is 0.2, and is 0.5 for strain diffractometry. The transmission geometry allows the resolution to be improved by a factor of three at a maximum. ESA

THE EFFECT OF A TRANSPORT CURRENT ON THE SURFACE BARRIER OF A UNIAXIAL ANISOTROPIC SUPERCONDUCTING SLAB
A. G. Saif Oct. 1992 9 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-617135; IC-92/360) Avail: CASI HC A02 (US Sales Only)

The role of a transport current on the annihilation of the surface barrier for high temperature type II superconducting infinite slab of arbitrary thickness is investigated. The London penetrating field, the vortex fields, and the Gibbs potential are calculated. The barrier depends on the external field strength, the value of the transport current flowing through the slab and the orientation of the external field. An agreement of our results with the previous one in some cases is found. DOE

EFFECTS OF A VIBRATING WIRE CARRYING DC CURRENT ON A MOVING TYPE 2 SUPERCONDUCTING SLAB OF ARBITRARY THICKNESS
A. G. Saif Oct. 1992 8 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-617136; IC-92/361) Avail: CASI HC A02 (US Sales Only)

A modified London equation is developed to study the system of a vibrating wire (two vibrating wires) carrying a direct current parallel to a moving type II superconducting infinite slab of arbitrary thickness. Exact solutions of the magnetic vector potential inside and outside the superconducting sample are obtained. Moreover, exact integral expression of power losses is obtained. These analytical solutions can be used for testing of the superconducting slabs in motion and the related problems of losses of moving superconductors. A good agreement with previous results is found in some limited cases. DOE

SIMULATION OF THE VORTEX MOTION IN THE HIGH T(c) SUPERCONDUCTORS
Jin-Ming Dong Nov. 1992 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-617138; IC-92/373) Avail: CASI HC A03 (US Sales Only)

One-d and 2D simulations of the single vortex dynamics in the presence of random pinning potential and periodical one were carried out. It is shown that the randomness of the pinning sites distribution does not have considerable effect on the transport properties such as I-V characteristics of the high T(sub c) superconductors, which was widely discussed in the approximation of a periodical pinning potential using analytical method. The randomness effect probably only reduces the vortex diffusing mobility more below the depinning current value, which is more obvious at lower temperature. DOE

MAGNETIC PROPERTIES OF NdCo3 AND ITS GAMMA PHASE HYDRIDE NdCo3H(4.1)
M. I. Bartashevich, K. Koui, T. Goto, M. Yamaguchi (Yokohama National Univ., Japan.), I. Yamamoto (Yokohama National Univ., Japan.), and F. Sugaya (Yokohama National Univ., Japan.) Feb. 1993 25 p Sponsored by Inoue Science Foundation, Tokyo, Japan and Ministry of Education, Science and Culture, Tokyo, Japan
(Rept-A-2655; JTN-94-80526) Avail: CASI HC A03/MF A01

Magnetization measurements have been carried out for an aligned powder sample NdCo3 and for an isotropic one of the hydride NdCo3H(4.1). NdCo3 is a ferromagnet with T(sub c) = 381 K and exhibits a spin reorientation transition of easy direction from the basal plane to the c-axis in the temperature range 220 to 255 K. NdCo3 shows a field induced phase transition in low fields below 0.7 T along the c-axis from the collinear to noncollinear structure at temperatures below 115 K. NdCo3H(4.1) is an antiferromagnet with T(sub N) = 214 K and exhibits a metamagnetic transition to the ferromagnetic structure in applied magnetic fields. The transition field of NdCo3H(4.1) is significantly decreased compared with the hydride with nonmagnetic Y instead of Nd by the positive exchange field acting on the Co sublattice from the Nd sublattice. TRANSIENT FLOWS OCCURRING DURING THE ACCELERATED CRUCIBLE ROTATION TECHNIQUE
Atara Horowitz and Yigal Horowitz (Ben Gurion Univ. of the Negev, Beersheva, Israel.) Nov. 1992 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-617049; NRCN-533) Avail: CASI HC A03 (US Sales Only)

The transient flows occurring after a change in the angular velocity of the cylindrical container are described. The dependence of the transient (known as spin-up or spin-down time) on experimental parameters as kinematic viscosity, cylinder dimensions, and the cylinder's initial and final angular velocities are elucidated by a review of the literature. It is emphasized that with large Rossby numbers the spin-up time is longer and the amount of fluid mixing is greater than small and moderate Rossby numbers. It is also elucidated that most crystal growth crucibles cannot be considered as infinitely-long cylinders for the evaluation of the fluid dynamics. DOE

ELECTRONIC STRUCTURE AND HIGH PRESSURE PHASE TRANSITION IN LaSb AND CeSb
S. Mathi Jaya and S. P. Sanyal Sep. 1992 20 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-617051; IC-92/287) Avail: CASI HC A03 (US Sales Only)

The electronic structure and high pressure structural phase transition in cerium and lanthanum antimonides were investigated using the tight binding Linear Muffin-Tin Orbitals (LMTO) method. The calculation of total energy reveals that the simple tetragonal structure is found to be stable at high pressures for both the compounds. In the case of LaSb, the calculated value of the equilibrium cell volume and the cell volume at which phase transition occurs are found to have a fairly good agreement with the experimental results. However, in the case of CeSb, the agreement is not as good as in LaSb. The most favored c/a value in the high pressure phase (simple tetragonal) for these compounds was also predicted. Further the calculated results on the electronic structure of these systems at the equilibrium as well as at the reduced cell volumes are presented. DOE

LATTICE DYNAMICS OF Ba(1-x)K(x)BiO3 AS STUDIED BY NEUTRON SCATTERING AND COMPUTER SIMULATION
A. V. Belushkin, A. V. Vagov, M. G. Zemlyanov, and P. P. Parshin 1991 15 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-617053; JINR-E-14-91-519) Avail: CASI HC A03 (US Sales Only)

A time-of-flight neutron inelastic scattering study of the lattice dynamics of Ba(1-x)K(x)BiO3 for x = 0.0 and x = 0.4 was performed for the temperatures 10, 80, and 290 K. No temperature effects were found for the generalized phonon density of states. The phonon spectrum of a superconducting sample reveals less in number van Hove singularities and softens in comparison with that of the nonsuperconducting one. On the basis of the simple model for interatomic potential the lattice dynamics of this system was calculated. Some features of the structural phase diagram and the optical spectroscopy data were explained using this model. The calculated phonon density of states was found to be in good agreement with experiment. DOE

THE HALDANE ENERGY GAP OF A DOPED LINEAR-CHAIN HEISENBERG ANTIFERROMAGNET
Zhong-Yi Lu, Zhao-Bin Su, and Lu Yu Nov. 1992 14 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-617130; IC-92/378) Avail: CASI HC A03 (US Sales Only)

Using the valence-bond-solid (VBS) approach and the Schwinger boson mean field approximation, the dependence of the Haldane gap of a spin-1 linear chain Heisenberg antiferromagnet on impurity doping with different spins was studied. The impurity spins affect the singlet pairing order parameter (Delta) and the constraint factor (lambda). As a result, the Haldane gap is reduced by a factor approximately n(sub i)(sup 2/3), with n(sub i) as the impurity concentration, and eventually collapses at n(sub i) approximately 1/(xi) with (xi) as the VBS correlation length. This theoretical prediction can be verified by neutron scattering experiments. DOE

(AD-A273686; WL-TR-93-4088) Avail: CASI HC A03/MF A01

The structure of cholesteryl-4-vinylbenzoate was determined by x ray diffraction. The molecule is elongated, with the benzoate group oriented out of the plane of the tetracyclic core. Molecules pack antiparallel, with overlap between either aliphatic tails or tetracyclic cores. These two types of interactions (overlap) are similar to the two packing modes that coexist in the liquid crystalline phase. DTIC

EFFECT OF HIGH FREQUENCY FIELD ON THE TRANSPORT PROPERTIES OF SUPERLATTICE
S. Y. Mensah Oct. 1992 9 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-617047; IC-92/299) Avail: CASI HC A02 (US Sales Only)

Theoretical study of the transport properties of semiconductor superlattice (SL) in the presence of external electric field E(t) has been investigated with the help of Boltzmann's equation. The model adopted agrees fairly well with experimental work as well as Monte Carlo simulation. Among the phenomena observed are the induced self transparency, absolute negative conductivity and the negative differential conductivity. In the case of negative differential conductivity (NDC) it is observed that it does also occur under the a.c. and d.c electric field but appears only when (omega)(tau) is much less than than 1. It does appear in the vicinity where the d.c field E(sub 0) is equal to the amplitude of the a.c. field E(sub 1) and the peak decreases with an increase in E(sub 1). DOE

CONTRIBUTION OF ALL EXCITED STATES TO ZFS OF A (SUP 6) S-STATE
Wang Kangying Oct. 1992 11 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-617007; IC-92/348) Avail: CASI HC A03 (US Sales Only)

The rank-four spin-Hamiltonian parameter b(sup 0)(sub 4) and the rank-two term b(sup 0)(sub 2) of a 3d(sup 5) ion are examined by diagonalizing the complete energy matrices using SO mechanism in tetragonal symmetry. It is shown that the parameter b(sup 0)(sub 2) arises mainly from the interaction of a (sup 6)S-state with the spin quartets, but the calculation b(sup 0)(sub 4) must consider the contribution of the spin doublets. It makes no difference in the cubic field, where the quartets only play the role of a bridge. Numerical calculation for Mn(2+) ions in CaWO4 show that EPR zero-field splitting parameters might have uniformly been interpreted by using SO mechanism. DOE

MAGNETIC FIELD-INDUCED SADDLE POINT IN GaAs/AlGaAs SHORT PERIOD SUPERLATTICES
Satoshi Sasaki, Noboru Miura, and Yoshiji Horikoshi (Nippon Telegraph and Telephone Public Corp., Tokyo, Japan.) Feb. 1993 15 p
(Rept-A-2656; JTN-94-80527) Avail: CASI HC A03/MF A01

Interband magneto-absorption spectra of (GaAs)(6)/(Al(0.51)Ga(0.49)As)(6) = (6, 6) and (GaAs)(14)/(AlAs)(6) = (14, 6) under pulsed high magnetic fields up to 150 T was measured. In sample (6, 6), drastic broadening of the exciton peak due to a magnetic field-induced saddle point was observed when high magnetic fields were applied in the direction parallel to the layer planes and the cyclotron radius became smaller than the superlattice period. The line shape of the broadened exciton resonance was qualitatively understood as an effect of the Coulomb interaction between electrons and holes. The exciton binding energy of sample (6, 6) was estimated as 7.0 meV using the perturbational theory, which reflects an intermediate nature of the superlattice between bulk crystals and two-dimensional quantum wells. QUANTUM MECHANICS, LOCALITY AND REALISM
Jowi W. deRoever and Martin Streng Feb. 1993 21 p
(MEMO-1117; ETN-94-94757) Avail: CASI HC A03/MF A01

The question of whether the theory of quantum mechanics is a local realistic theory is addressed. The concept of locality is shown to be independent of the postulates of quantum mechanics. In particular, under the assumption that nature is local, the quantum mechanical predictions concerning experiments on correlated systems are shown to satisfy Bell's inequalities. ESA

ON SPONTANEOUS SYMMETRY BREAKING MECHANISM IN LIGHT-FRONT QUANTIZED FIELD THEORY
P. P. Srivastava 1992 11 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-633211; CBPF-NF-004/92) Avail: CASI HC A03 (US Sales Only)

Following the (standard) Dirac procedure, the spontaneous symmetry breaking in light-front quantized scalar field theory is described. The zero mode operator of the field is shown to commute with the nonzero mode operators, and thus may be looked upon as a background field. In the light-front framework a nonlocal constraint must be satisfied. The values of the background field at the tree level, as a consequence, are shown to follow from the minimization of the light-front energy functional. We are thus led to a description parallel to the one made in equal-time-framework where we appeal to physical considerations and minimize the energy. These values characterize the various (non-perturbative) vacua over which the corresponding physical sectors may be built by applying the non-zero mode operators. DOE

FULLY COUPLED NONLINEAR THERMOMECHANICAL ANALYSIS INCLUDING GENERAL CONTACT IN PALM2D
B. E. Engelmann and R. G. Whirley Oct. 1993 7 p Presented at the Annual Winter Meeting of the American Society of Mechanical Engineers,

New Orleans, LA, 28 Nov. - 3 Dec. 1993
(Contract W-7405-eng-48)
(DE94-001661; UCRL-JC-115418; CONF-931121-27) Avail: CASI HC A02/MF A01

Fully coupled thermomechanical analysis solves the thermal problem on the deforming geometry and incorporates thermal loads into the mechanical problem. In contrast, traditional thermal stress analysis is based on an uncoupled approach in which the thermal problem is solved on a fixed geometry, and the resulting temperatures are then used to load a mechanical problem. Thermal contact, in which heat flow paths depend on the mechanical deformations of adjacent surfaces, is a major component of many fully coupled thermomechanical analyses. This paper presents the development of a thermomechanical finite element formulation, including contact. The proposed approach accommodates arbitrarily large relative motions of contact surfaces, fully unstructured meshes, pressure-dependent contact resistance, conduction across small gaps, and approximate models for convection and radiation. The theory described herein has been implemented in the Lawrence Livermore National Laboratory public code PALM2D and has been used to solve a diverse set of thermomechanical problems. Examples illustrating the performance of this code on large deformation thermomechanical problems are presented and discussed. DOE

CALCULATIONS OF BOSE-EINSTEIN CORRELATIONS FROM RELATIVISTIC QUANTUM MOLECULAR DYNAMICS

J. P. Sullivan, M. Berenguer, D. E. Fields, B. V. Jacak, M. Sarabura, J. Simon-Gillo, H. Sorge, H. vanHecke, and S. Pratt (Michigan State Univ., East Lansing.) 1993 5 p Presented at the 10th International Conference on Ultra-Relativistic Nucleus-Nucleus Collisions, Borlaenge, Sweden, 20-24 Jun. 1993 Limited Reproducibility: More than 20% of this document may be affected by poor print
(Contracts W-7405-eng-36; W-31-109-eng-38)
(DE94-000794; LA-UR-93-3334; CONF-930636-4) Avail: Issuing Activity (Department of Energy (DOE))

Bose-Einstein correlation functions which are in good agreement with pion data can be calculated from an event generator. Here, pion and (preliminary) kaon data from CERN experiment NA44 are compared to the calculations. The dynamics of 200 GeV/nucleon (sup 32)S + Pb collisions are calculated, without correlations due to interference patterns of a many-body wavefunction for identical particles, using the Relativistic Quantum Molecular Dynamics model (RQMD). The model is used to generate the phase-space coordinates of the emitted hadrons at the time they suffer their last strong interaction (freeze-out). Using the freeze-out position and momentum of pairs of randomly selected identical particles, a two-particle symmetrized wave-function is calculated and used to add two-body correlations. Details of the technique have been described previously. The method is similar to that used in the Spacer program. DOE

ENERGY AND MAXIMUM NORM ESTIMATES FOR NONLINEAR CONSERVATION LAWS

Pelle Olsson and Joseph Oliger Jan. 1994 28 p
(Contract NAS2-13721)
(NASA-CR-195091; NAS 1.26:195091; RIACS-TR-94-01) Avail: CASI HC A03/MF A01

We have devised a technique that makes it possible to obtain energy estimates for initial-boundary value problems for nonlinear conservation laws. The two major tools to achieve the energy estimates are a certain splitting of the flux vector derivative f(u)(sub x), and a structural hypothesis, referred to as a cone condition, on the flux vector f(u). These hypotheses are fulfilled for many equations that occur in practice, such as the Euler equations of gas dynamics. It should be noted that the energy estimates are obtained without any assumptions on the gradient of the solution u. The results extend to weak solutions that are obtained as point wise limits of vanishing viscosity solutions. As a byproduct we obtain explicit expressions for the entropy function and the entropy flux of symmetrizable systems of conservation laws. Under certain circumstances the proposed technique can be applied repeatedly so as to yield estimates in the maximum norm. Author (revised)

DENSITY ESTIMATION BY MAXIMUM QUANTUM ENTROPY

R. N. Silver, T. Wallstrom, and H. F. Martz 1993 14 p Presented at the Maximum Entropy and Bayesian Methods 1993, Santa Barbara, CA, 1-4 Aug. 1993
(Contract W-7405-eng-36)
(DE94-002626; LA-UR-93-3550; CONF-9308188-1) Avail: CASI HC A03/MF A01

A new Bayesian method for non-parametric density estimation is proposed, based on a mathematical analogy to quantum statistical physics. The mathematical procedure is related to maximum entropy methods for inverse problems and image reconstruction. The information divergence enforces global smoothing toward default models, convexity, positivity, extensivity and normalization. The novel feature is the replacement of classical entropy by quantum entropy, so that local smoothing is enforced by constraints on differential operators. The linear response of the estimate is proportional to the covariance. The hyperparameters are estimated by type-II maximum likelihood (evidence). The method is demonstrated on textbook data sets. (PB93-204477; RAL-93-010; UFIFT-93-06) Avail: Issuing Activity (National Technical Information Service (NTIS))

The authors develop a systematic analysis of quark mass matrices which, starting with the measured values of quark masses and mixing angles, allows for a model independent search for all possible (symmetric or hermitian) mass matrices having texture zeroes at the unification scale. A survey of all six and five texture zero structures yields a total of five possible solutions which may be distinguished by improved measurements of the CKM matrix elements and which may readily be extended to include lepton masses with the Georgi-Jarlskog texture. The solutions naturally suggest a parameterization for the mass matrices based on a perturbative expansion and the authors present some speculations concerning the origin of such structure. NTIS

SOME MAXIMALITY RESULTS FOR EFFECT-VALUED MEASURES

S. V. Dorofeev and J. deGraaf Jun. 1993 28 p Limited Reproducibility: More than 20% of this document may be affected by poor print and microfiche quality
(PB94-111176; RANA-93-08) Avail: Issuing Activity (National Technical Information Service (NTIS))

An approach is provided to the theory of effect-valued measures taking their values in the positive operators on a Hilbert space. The concept of operator-valued measure is fundamental in modern theories of quantum measurements. In the paper we introduce and study relations of dominance and equivalence between two effect-valued measures and concepts of maximal and minimal effect-valued measures. Characterizations of maximal effect-valued measures are obtained in the discrete case and in the case of commutative range. As an example, we study the so-called Bargman measure which can be interpreted as a simultaneous non-ideal measurement of position and momentum. NTIS

A STUDY OF ELEMENT INTERACTION IN THERMOACOUSTIC ENGINES Annual Report, 1 Oct. 1992 - 30 Sep. 1993

Richard Raspet and Henry E. Bass 13 Nov. 1993 11 p
(Contract N00014-93-1-0077)
(AD-A273228; PARGUM-93-04) Avail: CASI HC A03/MF A01

The physical understanding of thermoacoustic engines has progressed rapidly in the past five years. The general performance of prime movers and refrigerators is now reasonably well understood and documented. There are, however, notable discrepancies between theory and experiment, especially at large acoustic amplitudes. The discrepancies are typically attributed to non-linear terms not included in the theory. Acoustic streaming is often mentioned as the culprit and this may well be the case. There is evidence, however, that interactions between elements in the engine are at least partially responsible for the differences. This is illustrated, for example, by Swift's observation that the heat exchanger appears to be effective over larger acoustic displacements than simple geometric arguments predict. Additional element interactions will arise when a thermoacoustic prime mover and a refrigerator are placed in the same acoustic cavity. This three year project centers on studies of different thermoacoustic element geometries. DTIC

QUANTUM OPTICAL ASPECTS OF TOPOLOGICAL PHASES, SUCH AS BERRY'S PHASE Final Report, Jan. 1988 - Dec. 1991

Raymond Y. Chiao 10 Nov. 1993 6 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-88-K-0126)
(AD-A273632) Avail: Issuing Activity (Defense Technical Information Center (DTIC))

The contract was for performing experiments on a recently discovered topological phase factor known as 'Berry's phase.' We proposed to examine this phase at both the quantum and classical levels, in its various manifestations. The goals of this contract were successfully accomplished; in particular, we succeeded in demonstrating this phase at the single photon level, thereby demonstrating that this phase did not originate at the classical level. Possible applications of this phase were explored. A two-photon light source, in the form a parametric down-converter of ultraviolet laser photons into highly correlated red photons was successfully constructed, and coincidence counting techniques were successfully applied to the detection of the conjugate signal and idler red photons. This formed the experimental basis for the examination of not only Berry's phase, but of the energy-time uncertainty relations, the Franson experiment, the measurement of the tunneling time of the photon, the quantum eraser, and other optical phenomena closely related to the Einstein-Podolsky-Rosen 'paradox.' AN ATTEMPT AT A MACROREALISTIC QUANTUM WORLDVIEW

G. C. Ghirardi Nov. 1992 29 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616821; IC-92/392) Avail: CASI HC A03 (US Sales Only)

Many scientists agree that various difficulties arise when one tries to build up a worldview incorporating some form of realism which can accommodate our knowledge about natural phenomena. Whether quantum mechanics (Q.M.), in the standard interpretation or in some of its more widely known and accepted variants, can be taken as a basis for such a program was investigated. Having pointed out that, in our opinion, this is not the case, an attempt to overcome the difficulties by accepting stochastic and nonlinear modifications of the evolution equation of the theory is presented. ON THE CONNECTION OF CLASSICAL MECHANICS, PHYSICAL KINETICS AND QUANTUM THEORY

V. I. Gordelij and A. E. Savelev 1991 16 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616823; JINR-R-17-91-269) Avail: CASI HC A03 (US Sales Only)

The Schroedinger equation was generalized to consideration of the particles interaction with vacuum. The generalized Schroedinger ratio turned out to be a one-to-one correspondence between classical mechanics and physical kinetics. It is important that all results which follow from the Schroedinger equation are reproduced. The analytical solution of the generalized Schroedinger equation was found under the next conditions: (1) the potential external forces exerted over all parameters and with the whole space; and (2) classical mechanics Hamilton-Yacobi's equation has an ideal solution, i.e. the dependence of particle velocity on time only. The analytical solution of the generalized Schroedinger equation turned out to be coherent. The coherent properties of a wave function do not depend on symmetries by which the Hamiltonian determining the particle motion can be characterized. The investigation was performed at the Laboratory of Neutron Physics, JINR. DOE

APPLICATIONS OF SUPERSYMMETRIC QUANTUM MECHANICS Ph.D. Thesis

Rachel Heloise Rietdijk 1992 115 p Sponsored by Stichting voor Fundamenteel Onderzoek der Materie, Netherlands Prepared in cooperation with Nationaal Inst. voor Kernfysica en Hoge Energiefysica, Amsterdam, Netherlands Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(ETN-94-95385) Avail: Issuing Activity (European Space Agency (ESA))

One of the simplest physical theories exhibiting supersymmetry, the spinning particle model, is considered. The symmetries of the spinning particle on an arbitrary Riemannian manifold are investigated. From the point of view of the one dimensional field theory global symmetries are looked for (that is constant on the world line) which correspond to conserved quantities which can be used to solve the equations of motion. Attention is also drawn to the application of supersymmetric quantum mechanical models (that is spinning particle models) defined on an arbitrary Riemannian manifold to the calculation of anomalies in quantum field theories defined on the same manifold. ON BRST QUANTIZATION OF CONSTRAINED SYSTEMS Ph.D. Thesis

Wolfgang Kalau 1992 102 p Sponsored by Graduiertenfoerderung NRW, and Stichting voor Fundamenteel Onderzoek der Materie, Netherlands Prepared in cooperation with Nationaal Inst. voor Kernfysica en Hoge Energiefysica, Amsterdam, Netherlands
(ETN-94-95386) Avail: CASI HC A06/MF A02

The Hamiltonian analysis of a classical system with constraints is introduced and canonical quantization discussed. This method is illustrated by the example of Yang-Mills (YM) theory. The BRST quantization procedure is introduced and discussed for the case of YM theory. A formulation of general relativity, where the attempt is made to construct a system which avoids non-polynomial constraints without introducing complex variables, is presented. However, it turned out, that there are second class constraints. General aspects of BRST cohomology and a gauge fixing based on harmonic gauges are studied. The cohomology of a nontrivial example taken from the theory of higher spin particles is discussed. Systems with second class constraints are considered. The Gupta-Bleuler quantization method is introduced in order to formulate a necessary nontrivial condition for the applicability of this method to systems with second class constraints. A proof that this condition holds in any classical system is given. The BRST method is generalized to systems which allow for Gupta-Bleuler quantization. This method is applied to the four dimensional superparticle and developed to a system with an anomaly, two dimensional YM theory. The general structure of the cohomology for this system is discussed. The cohomology of SU(2)-YM theory is analyzed. ESA

THE 2D SUPERGRAVITY AND INTEGRABLE SYSTEMS

R. Ch. Rashkov Nov. 1992 10 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616848; IC-92/372) Avail: CASI HC A02 (US Sales Only)

In this letter, we consider a realization of Osp (2/2) Kac-Moody algebra and its connection with the integrable systems. Integrable hierarchy based on the constrained Osp (2/2) connection is constructed. Using zero-curvature formulation we elucidate the connection between the integrable hierarchy and 2D supergravity. It is shown that super-Virasoro transformations are symmetries of our hierarchy. The analogies with W(sup 2)(sub 3) algebra are given. DOE

PHASE STRUCTURE OF THE TWO-DIMENSIONAL PHI(4) FIELD THEORY WITHIN THERMO-FIELD DYNAMICS

G. V. Efimov and S. N. Nedelko (Tomsk State Univ., USSR.) 1991 36 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616850; JINR-E-2-91-464) Avail: CASI HC A03 (US Sales Only)

Phase structure of the two-dimensional phi(sup 4) field theory is investigated at arbitrary coupling constant and temperature. The critical values of the coupling constant and temperature, corresponding to symmetry rearrangement in the system, are calculated by the method of canonical transformations within the formalism of thermo-field dynamics. The Hamiltonians describing the system in each phase are obtained straightforwardly. DOE

N94-25339 Joint Inst. for Nuclear Research, Dubna (USSR). Lab. of Theoretical Physics.
DEVIATION EQUATIONS OF SYNGE AND SCHILD IN SPACES WITH AFFINE CONNECTION AND METRIC, AND EQUATIONS FOR GRAVITATIONAL WAVES DETECTORS
S. Manoff 1992 16 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616852; JINR-E-2-92-19) Avail: CASI HC A03 (US Sales Only)

Deviation equation of Synge and Schild has been investigated in spaces with affine connection and metric. By means of a non-isotropic u vector field and the orthogonal to it, metric h(sub u), a projected deviation equation of Synge and Schild has been obtained for the orthogonal to u vector field. For a given non-isotropic, autoparallel, and normalized u vector field, this equation could have in some special cases the form of an oscillator equation. DOE

CORRELATIONS IN THE ACTIONS OF PERIODIC ORBITS DERIVED FROM QUANTUM CHAOS
N. Argaman, E. Doron, J. Keating (Manchester Univ., England.), A. Kitaev (Landau Inst. for Theoretical Physics, Moscow, USSR.), M. Sieber, and U. Smilansky Sep. 1992 11 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616866; WIS-PH-92-73) Avail: CASI HC A03 (US Sales Only)

Based on semiclassical considerations, we derive universal expressions for a weighted two-point correlation function of actions of classical periodic orbits in chaotic systems. The derivation is based on the assumption that the semiclassical approximation succeeds in reproducing the results of Random Matrix Theory for the level statistics, even for times which exceed the Heisenberg time. A numerical study confirms the presence of these unexpected action correlations in three classically chaotic systems. We finally discuss the intimate relationship with the correlation between pairs of primes. DOE

HYDRIDE THERMODYNAMIC MACHINES [HYDRIDILAEMPOEVOIMAKONEET]
Seppo Taehtinen Oct. 1992 59 p In FINNISH Sponsored by Ministry of Trade and Industry, Finland; Technical Research Centre of Finland, Espoo; Imatran Voima Oy, Finland; and Rauma-Repola Oy, Tampere, Finland
(VTT-JULK-768; ISBN-951-38-4116-2; ETN-94-95241) Copyright Avail: CASI HC A04/MF A01

The operating principles of periodically operated thermodynamic machines based on connected metal hydride reaction beds are demonstrated. Temperature differences of 7.3 and 3.8 C for heating and cooling were measured for hydride heat pump operating at temperature levels of 20 and 80 C. For hydride heat transformer operating at temperature levels of 80 and 20 C the measured temperature differences were 8.9 and 5.6 C for heating and cooling. The continuous heating power of the hydride thermodynamic machine was 8.5 W/kg metal alloy. Based on the experimental results, the metal hydride reaction beds did not reach the chemical equilibrium during the operating cycles and measured dynamic equilibrium was used to evaluate the operation of the hydride thermodynamic machines. EFFECT OF LONGITUDINAL VIBRATION ON THE CAPILLARY LIMIT OF A WRAPPED SCREEN WICK COPPER/WATER HEAT PIPE M.S. Thesis
Neil F. Huber Dec. 1993 103 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(AD-A273830; AFIT/GAE/ENY/93D-18) Avail: CASI HC A06

The effect of longitudinal vibration on the capillary limit of a copper/water heat pipe with a tightly wrapped screen wick was investigated. The capillary limit was measured over a range of operating temperatures under static conditions. A benchtop shaker was used to provide vibration in the longitudinal axis of the heat pipe. The capillary limit was measured at vibration frequencies of 10, 30, and 50 Hz. At each of these frequencies, tests were run at vibration amplitudes of 0.2 and 2.0 g. The pipe was maintained at a constant inclination angle and power throughput was increased until dryout occurred. The power throughput at dryout was considered the capillary limit. The measured capillary limit for each vibration test was compared to the static tests to determine the effect of the vibration. The results covered operating temperatures from 41.4 to 96.6 C. A vibration amplitude of 0.2 g caused a 2.3 percent decrease in the capillary limit. However, there is a 3.7 percent uncertainty in the data. A vibration amplitude of 2.0 g at 30 and 50 Hz caused a 9.6 and 6.1 percent degrade in capillary heat transport limit, respectively. At 2.0 g and 10 Hz, there is a 1.8 percent decrease in capillary heat transport limit. DTIC

This document is a collection of technical reports on research conducted by the participants in the 1993 NASA/ASEE Summer Faculty Fellowship Program at KSC. The basic common objectives of the Program are: to further the professional knowledge of qualified engineering and science faculty members; to stimulate an exchange of ideas between participants and NASA; to enrich and refresh the research and teaching activities of participants' institutions; and to contribute to the research objectives of the NASA centers. 1993 topics include wide band fiber optic communications, a prototype expert/information system for examining environmental risks of KSC activities, alternatives to premise wiring using ATM and microcellular technologies, rack insertion end effector (RIEE) automation, FTIR quantification of industrial hydraulic fluids in perchloroethylene, switch configuration for migration to optical fiber network, and more. For individual titles, see N94-23231 through N94-23250.

WIDE BAND FIBER-OPTIC COMMUNICATIONS c32
Harry E. Bates *In* NASA. Kennedy Space Center, NASA/ASEE Summer Faculty Fellowship Program Oct. 1993 p 1-25 (For primary document see N94-23230 06-80)
Avail: CASI HC A03/MF A04

A number of optical communication lines are now in use at the Kennedy Space Center (KSC) for the transmission of voice, computer data and video signals. At the present time most of these channels utilize a single carrier wavelength centered near 1300 nm. As a result of previous work the bandwidth capacity of a number of these channels is being increased by transmitting another signal in the 1550 nm region on the same fiber. This is accomplished by means of wavelength division multiplexing (WDM). It is therefore important to understand the bandwidth properties of the installed fiber plant. This work developed new procedures for measuring the bandwidth of fibers in both the 1300nm and 1550nm region. In addition, a preliminary study of fiber links terminating in the Engineering Development Laboratory was completed. Author

CONTROL OF A SERPENTINE MANIPULATOR WITH COLLISION AVOIDANCE c37
Robert M. Byers *In* NASA. Kennedy Space Center, NASA/ASEE Summer Faculty Fellowship Program Oct. 1993 p 27-46 (For primary document see N94-23230 06-80)
Avail: CASI HC A03/MF A04

The robotics lab at the Kennedy Space Center is investigating the possibility of using a 'serpentine' manipulator for Shuttle inspection and payload processing. Serpentine manipulators are characterized by a large number of degrees of freedom giving them a high degree of redundancy. This redundancy allows them to be used to reach confined areas while avoiding collisions with their environment. In this paper, the author describes a new approach to controlling the joint rates for an n degree of freedom robot such that it moves its end effector to a desired position while simultaneously avoiding collision of any part of the robot arm with obstacles. Joint rates which move the end effector toward the target are found via a Lyapunov stability function. The gradient of an obstacle cost function indicates the direction toward obstacle collision in the joint space. The component of the end effector joint rates orthogonal to the obstacle gradient becomes the commanded joint rates. A notional eleven DOF model is used to numerically demonstrate the efficacy of the control law. Author

EVALUATION OF INORGANIC ZINC-RICH PRIMERS USING ELECTROCHEMICAL IMPEDANCE SPECTROSCOPY (EIS) c25
Luz M. Calle *In* NASA. Kennedy Space Center, NASA/ASEE Summer Faculty Fellowship Program Oct. 1993 p 47-76 (For primary document see N94-23230 06-80)
Avail: CASI HC A03/MF A04

This investigation explores the use of Electrochemical Impedance Spectroscopy (EIS) in combination with beach exposure as a short term method for analyzing the performance of twenty-one zinc-rich primers. The twenty-one zinc-rich primers were: Carboline CZ-11, Ameron Devoe-Marine Catha-Coat 304, Briner V-65, Ameron D-21-9, Sherwin Williams Zinc Clad II, Carboline CZ-D7, Ameron D-4, Dupont Ganicin 347WB, Porter TQ-4374H, Inorganic Coatings IC-531, Subox Galvanox IV, Southern Coatings Chemtec 600, Glidden Glidzinc 5530, Byco SP-101, Tnemec 90E-75, Devoe Catha-Coat 302H, Glidden Glidzinc 5536, Koppers 701, Ameron D-21-5, Coronado 935-152, and Subox Galvanoz V. Data were also collected on galvanized steel for comparison purposes. A library of Bode magnitude plots was generated for each coating including curves for the initial time and after each week of atmospheric exposure as Beach Corrosion Test Site near the Space Shuttle launch pad at the Kennedy Space Center for up to three weeks. An examination of the variation of the Bode magnitude plots with atmospheric exposure revealed no clearly identifiable trend at this point that could distinguish between the good and the poor coatings. The test will be continued by including EIS measurements after six months and one year of atmospheric exposure. Author

A FRAMEWORK FOR SFC/DC SYSTEM DATA ANALYSIS c66
Martha A. Centeno *In* NASA. Kennedy Space Center, NASA/ASEE Summer Faculty Fellowship Program Oct. 1993 p 77-90 (For primary document see N94-23230 06-80)
Avail: CASI HC A03/MF A04

The Shop Floor Control/Data Collection (SFC/DC) system is one of four major modules of the Integrated Work Control System being implemented at the NASA Kennedy Space Center. The SFC/DC system, which has been in operation approximately one and a half years, collects detailed information regarding the duration of tasks as well as work stoppages duration. This information needs to be effectively analyzed, so as be able to manage the shuttle processing activities under the continuous improvement philosophy. We have studied the contents and form of the SFC/DC database, and based on the results of such study, we have designed a Shop floor Modeling, Analysis, and Reporting Tool (SMART). SMART is a collection of compatible tools (off-the-shelf as well as customized C-based tools) that work cohesively to prepare inputs for the analysis models and process the various models. The feasibility of SMART has been demonstrated through an initial prototype. Author

LIGHTNING STUDIES USING LDAR AND LLP DATA c47
Gregory S. Forbes *In* NASA. Kennedy Space Center, NASA/ASEE Summer Faculty Fellowship Program Oct. 1993 p 165-194 (For primary document see N94-23230 06-80)
Avail: CASI HC A03/MF A04

This study intercompared lightning data from LDAR and LLP systems in order to learn more about the spatial relationships between thunderstorm electrical discharges aloft and lightning strikes to the surface. The ultimate goal of the study is to provide information that can be used to improve the process of real-time detection and warning of lightning by weather forecasters who issue lightning advisories. The Lightning Detection and Ranging (LDAR) System provides data on electrical discharges from thunderstorms that includes cloud-ground flashes as well as lightning aloft (within cloud, cloud-to-cloud, and sometimes emanating from cloud to clear air outside or above cloud). The Lightning Location and Protection (LLP) system detects primarily ground strikes from lightning. Thunderstorms typically produce LDAR signals aloft prior to the first ground strike, so that knowledge of preferred positions of ground strikes relative to the LDAR data pattern from a thunderstorm could allow advance estimates of enhanced ground strike threat. Studies described in the report examine the position of LLP-detected ground strikes relative to the LDAR data pattern from the thunderstorms. The report also describes other potential approaches to the use of LDAR data in the detection and forecasting of lightning ground strikes. Author

REDUCED COST ALTERNATIVES TO PREMISE WIRING USING ATM AND MICROCELLULAR TECHNOLOGIES c33
Raghvendra R. Gejji *In* NASA. Kennedy Space Center, NASA/ASEE Summer Faculty Fellowship Program Oct. 1993 p 195-227 (For primary document see N94-23230 06-80)
Avail: CASI HC A03/MF A04

The cost of premises wiring keeps increasing due to personnel moves, new equipment, capacity upgrades etc. It would be desirable to have a wireless interface from the workstations to the fixed network, so as to minimize the wiring changes needed. New technologies such as microcellular personal communication systems are promising to bring down the cost of wireless communication. Another promising technology is Code Division Multiple Access (CDMA), which could dramatically increase the bandwidth available for wireless connections. In addition, Asynchronous Transfer Mode (ATM) technology is emerging as a technique for integrated management of voice, data, and video traffic on a single network. The focus of this investigation will be to assess the future utility of these new technologies for reducing the premise wiring cost at KSC. One of the issues to be studied is the cost comparison of 'old' versus 'new,' especially as time and technology progress. An additional issue for closer study is a feasible time-line for progress in technological capability. Author (revised)

COST BENEFITS OF ADVANCED SOFTWARE: A REVIEW OF METHODOLOGY USED AT KENNEDY SPACE CENTER c61
Prafulla N. Joglekar *In* NASA. Kennedy Space Center, NASA/ASEE Summer Faculty Fellowship Program Oct. 1993 p 229-268 (For primary document see N94-23230 06-80)
Avail: CASI HC A03/MF A04

To assist rational investments in advanced software, a formal, explicit, and multi-perspective cost-benefit analysis methodology is proposed. The methodology can be implemented through a six-stage process which is described and explained. The current practice of cost-benefit analysis at KSC is reviewed in the light of this methodology. The review finds that there is a vicious circle operating. Unsound methods lead to unreliable cost-benefit estimates. Unreliable estimates convince management that cost-benefit studies should not be taken seriously. Then, given external demands for cost-benefit estimates, management encourages software enginees to somehow come up with the numbers for their projects. Lacking the expertise needed to do a proper study, courageous software engineers with vested interests use ad hoc and unsound methods to generate some estimates. In turn, these estimates are unreliable, and the cycle continues. The proposed methodology should help KSC to break out of this cycle. Author (revised)

CHEMICAL CHARACTERIZATION OF SOME AEROBIC LIQUIDS IN CELSS c51
Brooks C. Madsen *In* NASA. Kennedy Space Center, NASA/ASEE Summer Faculty Fellowship Program Oct. 1993 p 269-299 (For primary document see N94-23230 06-80)
Avail: CASI HC A03/MF A04

Untreated aqueous soybean and wheat leachate and aerobically treated wheat leachate prepared from crop residues that are produced as a component of the Controlled Ecological Life Support System program designed to support long duration space missions were compared, and a general chemical characterization was accomplished. Solid phase extraction and high performance liquid chromatography were used to accomplish comparisons based on chromatographic and ultraviolet absorption properties of the components that are present. Specific compounds were not identified; however, general composition related to the initial presence of phenol-like compounds and their disappearance during aerobic treatment was explored. RACK INSERTION END EFFECTOR (RIEE) AUTOMATION c37
Narasimha Malladi *In* NASA. Kennedy Space Center, NASA/ASEE Summer Faculty Fellowship Program Oct. 1993 p 301-326 (For primary document see N94-23230 06-80)
Avail: CASI HC A03/MF A04

NASA is developing a mechanism to manipulate and insert Racks into the Space Station Logistic modules. The mechanism consists of the following: a base with three motorized degrees of freedom, a 3 section motorized boom that goes from 15 to 44 feet in length, and a Rack Insertion End Effector (RIEE) with 5 hand wheels for precise alignment. The robotics section was tasked with the automation of the RIEE unit. In this report, for the automation of the RIEE unit, application of the Perceptics Vision System was conceptually developed to determine the position and orientation of the RIEE relative to the logistic module, and a MathCad program is written to display the needed displacements for precise alignment and final insertion of the Rack. The uniqueness of this report is that the whole report is in fact a MathCad program including text, derivations, and executable equations with example inputs and outputs. Author (revised)

The purpose of this summer research project was to investigate whether perchloroethylene can be used as a solvent for the quantitative analysis of industrial hydraulic fluids by infrared spectroscopy employing Beer's law. Standard calibration curves using carbon-hydrogen stretching (generic) and ester absorption peaks were prepared for a series of standard dilutions at low ppm levels of concentration of seven hydraulic fluids in perchloroethylene. The absorbance spectras were recorded with 1.5-10 mm fixed and variable path length sample cells made of potassium bromide. The results indicate that using ester infrared spectral peak, it is possible to detect about 20 ppm of the hydraulic fluid in perchloroethylene. Author

STRESS CORROSION CRACKING PROPERTIES OF 15-5PH STEEL c26
Ferdinand Rosa *In* NASA. Kennedy Space Center, NASA/ASEE Summer Faculty Fellowship Program Oct. 1993 p 375-402 (For primary document see N94-23230 06-80)
Avail: CASI HC A03/MF A04

Unexpected occurrence of failures, due to stress corrosion cracking (SCC) of structural components, indicate a need for improved characterization of materials and more advanced analytical procedures for reliably predicting structures performance. Accordingly, the purpose of this study was to determine the stress corrosion susceptibility of 15-5PH steel over a wide range of applied strain rates in a highly corrosive environment. The selected environment for this investigation was a highly acidified sodium chloride (NaCl) aqueous solution. The selected alloy for the study was a 15-5PH steel in the H900 condition. The slow strain rate technique was selected to test the metals specimens. Author (revised)

Avail: CASI HC A03/MF A04

Many helium mass spectrometer leak detectors at KSC employ sampling systems that feature hand held sniffer probes. Authors of general leakage-testing literature recommend sniffer probes for leak location but not for quantitative leakage measurement. Their use in the latter application at KSC involves assumptions that may be subtle. The purpose of the research effort reported herein was to establish the significance of indicated leak rates displayed by sniffer-probe equipped leak detectors and to determine whether the use of alternative hardware or testing procedures may reduce the uncertainty of leakage measurements made with them. The report classifies probe-type sampling systems for helium leak detectors according to their internal plumbing (direct or branched), presents a basic analysis of the fluid dynamics in the sampling system in the branched-conduit case, describes the usual test method for measuring the internal supply-to-sample flowrate ratio (a.k.a permeation ratio), and describes a concept for a sponge-tipped probe whose external supply-to-sample flowrate ratio promises to be lower than that of a simple-ended probe. One conclusion is that the main source of uncertainty in the use of probe-type sampling systems for leakage measurement is uncertainty in the external supply-to-sample flowrate ratio. In contrast, the present method for measuring the internal supply-to-sample flowrate ratio is quantitative and satisfactory. The implication is that probes of lower external supply-to-sample flowrate ratio must be developed before this uncertainty may be reduced significantly. Author (revised)

The stated objectives for the summer of 1993 were: to review the Individual Development Plan Surveys for 1994 in order to automate the analysis of the Needs Assessment effort; and to develop and implement evaluation methodologies to perform ongoing program-wide course-to-course assessment. This includes the following: to propose a methodology to develop and implement objective, performance-based assessment instruments for each training effort; to mechanize course evaluation forms and develop software to facilitate the data gathering, analysis, and reporting processes; and to implement the methodology, forms, and software in at lease one training course or seminar selected among those normally offered in the summer at KSC. Section two of this report addresses the work done in regard to the Individual Development Plan Surveys for 1994. Section three presents the methodology proposed to develop and implement objective, performance-based assessment instruments for each training course offered at KSC. Derived from text

EXPANDING THE KATE TOOLBOX c63
Stan J. Thomas *In* NASA. Kennedy Space Center, NASA/ASEE Summer Faculty Fellowship Program Oct. 1993 p 467-486 (For primary document see N94-23230 06-80)
Avail: CASI HC A03/MF A04

KATE (Knowledge-based Autonomous Test Engineer) is a model-based software system developed in the Artificial Intelligence Laboratory at the Kennedy Space Center for monitoring, fault detection, and control of launch vehicles and ground support systems. In order to bring KATE to the level of performance, functionality, and integratability needed for firing room applications, efforts are underway to implement KATE in the C++ programming language using an X-windows interface. Two programs which were designed and added to the collection of tools which comprise the KATE toolbox are described. The first tool, called the schematic viewer, gives the KATE user the capability to view digitized schematic drawings in the KATE environment. The second tool, called the model editor, gives the KATE model builder a tool for creating and editing knowledge base files. Design and implementation issues having to do with these two tools are discussed. It will be useful to anyone maintaining or extending either the schematic viewer or the model editor. HURRICANE RISK ASSESSMENT: ROLLBACK OR RIDE OUT c47
Richard A. Wohlman *In* NASA. Kennedy Space Center, NASA/ASEE Summer Faculty Fellowship Program Oct. 1993 p 487-519 (For primary document see N94-23230 06-80)
Avail: CASI HC A03/MF A04

Winds in excess of 74.5 knots could cause severe damage to a space shuttle on the launch pad. Current plans exist for rollback to the Vehicle Assembly Building, but require 48 hour leadtime to implement. Decisions based upon cost/loss are evaluated to ascertain whether predetermined forecast probabilities for rollback/rideout decisions can be made far in advance of hurricane seasons for use in decision making. FLAME TRENCH ANALYSIS OF NLS VEHICLES c15
Nuri Zeytinoglu *In* NASA. Kennedy Space Center, NASA/ASEE Summer Faculty Fellowship Program Oct. 1993 p 521-550 (For primary document see N94-23230 06-80)
Avail: CASI HC A03/MF A04

The present study takes the initial steps of establishing a better flame trench design criteria for future National Launch System vehicles. A three-dimensional finite element computer model for predicting the transient thermal and structural behavior of the flame trench walls was developed using both I-DEAS and MSC/NASTRAN software packages. The results of JANNAF Standardized Plume flowfield calculations of sea-level exhaust plume of the Space Shuttle Main Engine (SSME), Space Transportation Main Engine (STME), and Advanced Solid Rocket Motors (ASRM) were analyzed for different axial distances. The results of sample calculations, using the developed finite element model, are included. The further suggestions are also reported for enhancing the overall analysis of the flame trench model. SWITCH CONFIGURATION FOR MIGRATION TO OPTICAL FIBER NETWORK c60
George W. Zobrist *In* NASA. Kennedy Space Center, NASA/ASEE Summer Faculty Fellowship Program Oct. 1993 p 551-579 (For primary document see N94-23230 06-80)
Avail: CASI HC A03/MF A04

The purpose is to investigate the migration of an Ethernet LAN segment to fiber optics. At the present time it is proposed to support a Fiber Distributed Data Interface (FDDI) backbone and to upgrade the VAX cluster to fiber optic interface. Possibly some workstations will have an FDDI interface. The remaining stations on the Ethernet LAN will be segmented. The rationale for migrating from the present Ethernet configuration to a fiber optic backbone is due to the increase in the number of workstations and the movement of applications to a windowing environment, extensive document transfers, and compute intensive applications. [ACTIVITIES INVOLVING AERONAUTICAL, SPACE SCIENCE, AND TECHNOLOGY SUPPORT FOR MINORITY INSTITUTIONS] Final Report
1993 4 p
(Contract NCCw-26)
(NASA-CR-195095; NAS 1.26:195095) Avail: CASI HC A01/MF A01

The Final Report addressed the activities with which the Interracial Council for Business Opportunity (ICBO) was involved over the past 12 months. ICBO was involved in the design and development of a CARES Student Tracking System Software (CARES). Cares is intended to provide an effective means of maintaining relevant current and historical information on NASA-funded students through a range of educational program initiatives. ICBP was extensively involved in the formation of a minority university consortium amd implementation of collaborative research activities by the consortium as part of NASA's Mission to Planet Earth/Earth Observing System. ICBO was involved in the formation of an HBCU/MI Consortium to facilitate technology transfer efforts to the small and minority business community in their respective regions. CASI

(NASA-CR-193862; NAS 1.26:193862) Avail: CASI HC A12/MF A03

For the 29th consecutive year, a NASA/ASEE Summer Faculty Fellowship Program was conducted at the Marshall Space Flight Center (MSFC). The program was conducted by the University of Alabama in Huntsville and

MSFC during the period of 6-1-93 through 8-6-93. Operated under the auspices of the American Society for Engineering Education, the MSFC program, as well as those at other NASA centers, was sponsored by the Office of Educational Affairs, NASA Headquarters, Washington, DC. The basic objectives of the programs, which are in the 30th year of operation nationally, are (1) to further the professional knowledge of qualified engineering and science faculty members; (2) to stimulate an exchange of ideas between participants and NASA; (3) to enrich and refresh the research and teaching activities of the participants' institution; and (4) to contribute to the research objectives of the NASA centers. For individual titles, see N94-24406 through N94-24455.

INTEROPERABILITY THROUGH STANDARDIZATION: ELECTRONIC MAIL, AND X WINDOW SYSTEMS c82
Ashok T. Amin *In its* The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

Since the introduction of computing machines, there has been continual advances in computer and communication technologies and approaching limits. The user interface has evolved from a row of switches, character based interface using teletype terminals and then video terminals, to present day graphical user interface. It is expected that next significant advances will come in the availability of services, such as electronic mail and directory services, as the standards for applications are developed and in the 'easy to use' interfaces, such as Graphical User Interface for example Window and X Window, which are being standardized. Various proprietary electronic mail (email) systems are in use within organizations at each center of NASA. Each system provides email services to users within an organization, however the support for email services across organizations and across centers exists at centers to a varying degree and is often easy to use. A recent NASA email initiative is intended 'to provide a simple way to send email across organizational boundaries without disruption of installed base.' The initiative calls for integration of existing organizational email systems through gateways connected by a message switch, supporting X.400 and SMTP protocols, to create a NASA wide email system and for implementation of NASA wide email directory services based on OSI standard X.500. A brief overview of MSFC efforts as a part of this initiative are described. Window based graphical user interfaces make computers easy to use. X window protocol has been developed at Massachusetts Institute of Technology in 1984/1985 to provide uniform window based interface in a distributed computing environment with heterogenous computers. It has since become a standard supported by a number of major manufacturers. Z Windows systems, terminals and workstations, and X Window applications are becoming available. However impact of its use in the Local Area Network environment on the network traffic are not well understood. It is expected that the use of X Windows systems will increase at MSFC especially for Unix based systems. An overview of X Window protocol is presented and its impact on the network traffic is examined. It is proposed that an analytical model of X Window systems in the network environment be developed and validated through the use of measurements to generate application and user profiles. Author

VISCOELASTIC ANALYSIS OF SEALS FOR EXTENDED SERVICE LIFE c37
Mark V. Bower *In its* The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

The space station is being developed for a service life of up to thirty years. As a consequence, the design requirements for the seals to be used are unprecedented. Full scale testing to assure the selected seals can satisfy the design requirements are not feasible. As an alternative, a sub-scale test program (2) has been developed by MSFC to calibrate the analysis tools to be used to certify the proposed design. This research has been conducted in support of the MSFC Integrated Seal Test Program. The ultimate objective of this research is to correlate analysis and test results to qualify the analytical tools which in turn, are to be used to qualify the flight hardware. Seals are simple devices, in wide spread use. The most common type of seal is the O-ring. O-ring seals are typically rings of rubber with a circular cross section. The rings are placed between the surfaces to be sealed, usually in a groove of some design. The particular design may differ based on a number of different factors. This research is focused on O-rings that are staticly compressed by perpendicular clamping forces, commonly referred to as face seals. In this type of seal the O-ring is clamped between the sealing surfaces by loads perpendicular to the circular cross section. Author

CAPE FOR CaPE c47
Joni Brooks *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

In an effort to improve short-term forecasting for the Kennedy Space Center region, Holle et al. (1992) investigated the effects of low level wind regimes on the distribution of cloud-to-ground lightning in central Florida. With a study period of 455 days, Holle et al. (1992) found 'southwest flow contributed 66 percent of the total network flashes while also occurring on the most days (142).' Relationships among mesoscale thermodynamic variables and precipitation and/or lightning have been addressed in previous studies in Canada and the Tennessee valley. Zawadzki et al. (1981) found 'soundings, surface pressure, temperature and humidity obtained from a standard observation network were correlated with rain rates given by raingages and radar.' Buechler et al. (1990) found 'a fair relationship between CAPE (convective available potential energy) and daily cloud-to-ground activity' with a correlation coefficient of $r = 0.68$. The present research will investigate the relationships among rainfall, cloud-to-ground (CG) lightning, CAPE, and low level wind flow using data collected during the CaPE (Convection and Precipitation/Electrification Experiment) field program. The CaPE field program was conducted in east central Florida from July 8, 1991 to August 18, 1991. Derived from text

A REVIEW OF ISEAS DESIGN c61
Alex Bykat *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 6 p (For primary document see N94-24405 06-80)
Avail: CASI HC A02/MF A03

The Space Station Freedom will offer facilities for experimentation and testing not available and not feasible or possible on earth. Due to a restricted space availability on board, the experimentation equipment and its organization will be frequently changing. This requires careful attention to electromagnetic compatibility between experimentation and other SSF equipment. To analyze the interactions between different equipment modules, a software system ISEAS is under development. Development of ISEAS was approached in two phases. In the 1st phase a PC version prototype of ISEAS was developed. In the 2nd phase, the PC prototype will be adapted to a VAX range of computers. The purpose of this paper is to review the design of the VAX version of ISEAS, and to recommend any suitable changes. Author

FINITE ELEMENT BASED ELECTRIC MOTOR DESIGN OPTIMIZATION c33

C. Warren Campbell *In its* The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

The purpose of this effort was to develop a finite element code for the analysis and design of permanent magnet electric motors. These motors would drive electromechanical actuators in advanced rocket engines. The actuators would control fuel valves and thrust vector control systems. Refurbishing the hydraulic systems of the Space Shuttle after each flight is costly and time consuming. Electromechanical actuators could replace hydraulics, improve system reliability, and reduce down time. Author

CHARACTERISTICS OF PRODUCTS GENERATED BY SELECTIVE SINTERING AND STEREOLITHOGRAPHY RAPID PROTOTYPING PROCESSES **c27**
Vikram Cariapa *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

The trend in the modern global economy towards free market policies has motivated companies to use rapid prototyping technologies to not only reduce product development cycle time but also to maintain their competitive edge. A rapid prototyping technology is one which combines computer aided design with computer controlled tracking of focussed high energy source (eg. lasers, heat) on modern ceramic powders, metallic powders, plastics or photosensitive liquid resins in order to produce prototypes or models. At present, except for the process of shape melting, most rapid prototyping processes generate products that are only dimensionally similar to those of the desired end product. There is an urgent need, therefore, to enhance the understanding of the characteristics of these processes in order to realize their potential for production. Currently, the commercial market is dominated by four rapid prototyping processes, namely selective laser sintering, stereolithography, fused deposition modelling and laminated object manufacturing. This phase of the research has focussed on the selective laser sintering and stereolithography rapid prototyping processes. A theoretical model for these processes is under development. Different rapid prototyping sites supplied test specimens (based on ASTM 638-84, Type I) that have been measured and tested to provide a data base on surface finish, dimensional variation and ultimate tensile strength. Further plans call for developing and verifying the theoretical models by carefully designed experiments. This will be a joint effort between NASA and other prototyping centers to generate a larger database, thus encouraging more widespread usage by product designers. Author

PERFORMANCE OF THE ENGINEERING ANALYSIS AND DATA SYSTEM 2 COMMON FILE SYSTEM **c82**
Linda S. DeBrunner *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

The Engineering Analysis and Data System (EADS) was used from April 1986 to July 1993 to support large scale scientific and engineering computation (e.g. computational fluid dynamics) at Marshall Space Flight Center. The need for an updated system resulted in a RFP in June 1991, after which a contract was awarded to Cray Grumman. EADS II was installed in February 1993, and by July 1993 most users were migrated. EADS II is a network of heterogeneous computer systems supporting scientific and engineering applications. The Common File System (CFS) is a key component of this system. The CFS provides a seamless, integrated environment to the users of EADS II including both disk and tape storage. UniTree software is used to implement this hierarchical storage management system. The performance of the CFS suffered during the early months of the production system. Several of the performance problems were traced to software bugs which have been corrected. Other problems were associated with hardware. However, the use of NFS in UniTree UCFM software limits the performance of the system. The performance issues related to the CFS have led to a need to develop a greater understanding of the CFS organization. This paper will first describe the EADS II with emphasis on the CFS. Then, a discussion of mass storage systems will be presented, and methods of measuring the performance of the Common File System will be outlined. Finally, areas for further study will be identified and conclusions will be drawn. Author

WATER CYCLE RESEARCH ASSOCIATED WITH THE CaPE HYDROMETEOROLOGY PROJECT (CHymP **c47**
Claude E. Duchon *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

One outgrowth of the Convection and Precipitation/Electrification (CaPE) experiment that took place in central Florida during July and August 1991 was the creation of the CaPE Hydrometeorology Project (CHymP). The principal goal of this project is to investigate the daily water cycle of the CaPE experimental area by analyzing the numerous land and atmosphere in situ and remotely sensed data sets that were generated during the 40-days of observations. The water cycle comprises the atmospheric branch. In turn, the atmospheric branch comprises precipitation leaving the base of the atmospheric volume under study, evaporation and transpiration entering the base, the net horizontal fluxes of water vapor and cloud water through the volume and the conversion of water vapor to cloud water and vice-versa. The sum of these components results in a time rate of change in the water and liquid water (or ice) content of the atmospheric volume. The components of the land branch are precipitation input to and evaporation and transpiration output from the surface, net horizontal fluxes of surface and subsurface water, the sum of which results in a time rate of change in surface and subsurface water mass. The objective of CHymP is to estimate these components in order to determine the daily water budget for a selected area within the CaPE domain. This work began in earnest in the summer of 1992 and continues. Even estimating all the budget components for one day is a complex and time consuming task. The discussions below provides a short summary of the rainfall quality assessment procedures followed by a plan for estimating the horizontal moisture flux. Author

FOIL BEARINGS **c37**
David A. Elrod *In its* The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

The rolling element bearings (REB's) which support many turbomachinery rotors offer high load capacity, low power requirements, and durability. Two disadvantages of REB's are: (1) rolling or sliding contact within the bearing has life-limiting consequences; and (2) REB's provide essentially no damping. The REB's in the Space Shuttle Main Engine (SSME) turbopumps must sustain high static and dynamic loads, at high speeds, with a cryogenic fluid as lubricant and coolant. The pump end ball bearings limit the life of the SSME high pressure oxygen turbopump (HPOTP). Compliant foil bearing (CFB) manufacturers have proposed replacing turbopump REB's with CFB's CFB's work well in aircraft air cycle machines, auxiliary power units, and refrigeration compressors. In a CFB, the rotor only contracts the foil support structure during start up and shut down. CFB damping is higher than REB damping. However, the load capacity of the CFB is low, compared to a REB. Furthermore, little stiffness and damping data exists for the CFB. A rotordynamic analysis for turbomachinery critical speeds and stability requires the input of bearing stiffness and damping coefficients. The two basic types of CFB are the tension-dominated bearing and the bending-dominated bearing. Many investigators have analyzed and measured characteristics of tension-dominated foil bearings, which are applied principally in magnetic tape recording. The bending-dominated CFB is used more in rotating machinery. This report describes the first phase of a structural analysis of a bending-dominated, multileaf CFB. A brief discussion of CFB literature is followed by a description and results of the present analysis. Author

DESIGN AND SPECIFICATION OF A CENTRALIZED MANUFACTURING DATA MANAGEMENT AND SCHEDULING SYSTEM **c81**

Phillip A. Farrington *In its* The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 6 p (For primary document see N94-24405 06-80)

Avail: CASI HC A02/MF A03

As was revealed in a previous study, the Materials and Processes Laboratory's Productivity Enhancement Complex (PEC) has a number of automated production areas/cells that are not effectively integrated, limiting the ability of users to readily share data. The recent decision to utilize the PEC for the fabrication of flight hardware has focused new attention on the problem and brought to light the need for an integrated data management and scheduling system. This report addresses this need by developing preliminary designs specifications for a centralized manufacturing data management and scheduling system for managing flight hardware fabrication in the PEC. This prototype system will be developed under the auspices of the Integrated Engineering Environment (IEE) Oversight team and the IEE Committee. At their recommendation the system specifications were based on the fabrication requirements of the AXAF-S Optical Bench. Author

NASA Headquarters is placing a high priority on the transfer of NASA and NASA contractor developed technologies and expertise to the private sector and to other federal, state and local government organizations. The ultimate objective of these efforts is positive economic impact, an improved quality of life, and a more competitive U.S. posture in international markets. The Technology Utilization Office (TUO) currently serves seven states with its technology transfer efforts. Since 1989, the TUO has handled over one-thousand formal requests for NASA related technologies assistance. The technology transfer process requires promoting public awareness of NASA related soliciting requests for assistance, matching technologies to specific needs, assuring appropriate technology transfer, and monitoring and evaluating the process. Each of these activities have one very important aspect in common: the success of each is dissemination of appropriate high quality information. The purpose of the research was to establish the requirements and develop a preliminary design for a database system to increase the effectiveness and efficiency of the TUO's technology transfer function. The research was conducted following the traditional systems development life cycle methodology and was supported through the use of modern structured analysis techniques. The next section will describe the research and findings as conducted under the life cycle approach. Author

A MINIMUM COST TOLERANCE ALLOCATION METHOD FOR ROCKET ENGINES AND ROBUST ROCKET ENGINE DESIGN **c20**

Richard J. Gerth *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)

Avail: CASI HC A01/MF A03

Rocket engine design follows three phases: systems design, parameter design, and tolerance design. Systems design and parameter design are most effectively conducted in a concurrent engineering (CE) environment that utilize methods such as Quality Function Deployment and Taguchi methods. However, tolerance allocation remains an art driven by experience, handbooks, and rules of thumb. It was desirable to develop and optimization approach to tolerancing. The case study engine was the STME gas generator cycle. The design of the major components had been completed and the functional relationship between the component tolerances and system performance had been computed using the Generic Power Balance model. The system performance nominals (thrust, MR, and Isp) and tolerances were already specified, as were an initial set of component tolerances. However, the question was whether there existed an optimal combination of tolerances that would result in the minimum cost without any degradation in system performance. Author

This work is the continuation of an optical technique development program initiated as part of the 1992 Summer Faculty Fellowship Program. The 1992 work consisted of the formulation and implementation of a technique ivolving the spatial deconvolution of fluorescence data from a uniformly illuminated, seeded densed spray to obtain quantitative measurements of the liquid density profiles. This measurement approach largely overcomes substantial scattering problems associated with other optical approaches for two-phase flows. However, to apply this measurement approach with confidence to unknown flows, the technique must be validated. Consequently, technique validation using classical grid patternator techniques has been focus of the current work. This work has included the design and construction of a patternator rig and the implementation of a test program designed for the comparison of patternator data with the deconvolved optical data. The flow field used for the validation is the plume of an axisymetric swirl coaxial LOX injector being considered for use in the Space Transportation System Main Engine. The flow facility is an improved version of the test rig which was constructed in 1992 for the initial technique development. This report includes a brief description of the optical measurement technique and the patternator rig and a presentation of the data comparisons. Author

IMPACT DAMAGE IN FILAMENT WOUND COMPOSITE BOTTLES **c24**

Alton L. Highsmith *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)

Avail: CASI HC A01/MF A03

Increasingly, composite materials are being used in advanced structural applications because of the significant weight savings they offer when compared to more traditional engineering materials. The higher cost of composites must be offset by the increased performance that results from reduced structural weight if these new materials are to be used effectively. At present, there is considerable interest in fabricating solid rocket motor cases out of composite materials, and capitalizing on the reduced structural weight to increase rocket performance. However, one of the difficulties that arises when composite materials are used is that composites can develop significant amounts of internal damage during low velocity impacts. Such low velocity impacts may be encountered in routine handling of a structural component like a rocket motor case. The ability to assess the reduction in structural integrity of composite motor cases that experience accidental impacts is essential if composite rocket motor cases are to be certified for manned flight. While experimental studies of the post-impact performance of filament wound composite motor cases haven been proven performed (2,3), scaling impact data from small specimens to full scale structures has proven difficult. If such a scaling methodology is to be achieved, an increased understanding of the damage processes which influence residual strength is required. The study described herein was part of an ongoing investigation of damage development and reduction of tensile strength in filament wound composites subjected to low velocity impacts. The present study, which focused on documenting the damage that develops in filament wound composites as a result of such impacts, included two distinct tasks. The first task was to experimentally assess impact damage in small, filament wound pressure bottles using x-ray radiography. The second task was to study the feasibility of using digital image processing techniques to assist in determining the 3-D distribution of damage from stereo x-ray pairs. Author

OCTAVE: A MARSYAS POST-PROCESSOR FOR COMPUTER-AIDEED CONTROL SYSTEM DESIGN **c61**
A. Scottedward Hodel *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

MARSYAS is a computer-aided control system analysis package for the simulation and analysis of dynamic systems. In the summer of 1991 MARSYAS was updated to allow for the analysis of sampled-data systems in terms of frequency response, stability, etc. This update was continued during the summer of 1992 in order to extend further MARSYAS commands to the study of sampled data systems. Further work was done to examine the computation of openat transfer functions, root-locii and omega-plane frequency response plots. At the conclusion of the summer of 1992 work, it was proposed that control-system design capability be incorporated into the MARSYAS package. It was decided at that time to develop a separate 'stand-alone' computer-aided control system design (CACSD) package. This report is a brief description of such a package. Author

ON THE ANALYSIS OF CLEAR AIR RADAR ECHOES SEVERELY CONTAMINATED BY CLUTTER **c32**
H. Mario Ierkic *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 6 p (For primary document see N94-24405 06-80)
Avail: CASI HC A02/MF A03

Many radar systems work in environments where clutter return overwhelm the atmospheric echoes. Sometimes by as much as 50 dB. At the Arecibo Observatory (AO), for example, clutter levels are conspicuously high. This situation greatly reduces its usefulness for lower atmospheric studies. It is not possible in general, to observe height profiles of the vertical component of the wind velocity. This parameter is important to understand planetary scale circulation, mountain and lee waves, turbulence, troprospheric and stratorspheric interactions and vertical transport of horizontal momentum. The topics discussed include the following: clutter propagation characteristics, knowledge-based spectral analysis system, and signal analysis system. Author

A COMPILATION OF TECHNOLOGY SPINOFFS FROM THE US SPACE SHUTTLE PROGRAM **c85**
David Jeff Jackson *In its* The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

As the successful transfer of NASA-developed technology is a stated mission of NASA, the documentation of such transfer is vital in support of the program. The purpose of this report is to document technology transfer, i.e. 'spinoffs', from the U.S. Space Shuttle Program to the commercial sector. These spinoffs have their origin in the many scientific and engineering fields associated with the shuttle program and, as such, span many diverse commercial applications. These applications include, but are not limited to, consumer products, medicine, industrial productivity, manufacturing technology, public safety, resources management, materials processing, transportation, energy, computer technology, construction, and environmental applications. To aide to the generation of this technology spinoff list, significant effort was made to establish numerous and complementary sources of information. The primary sources of information used in compiling this list include: the NASA 'Spinoff' publication, NASA Tech Briefs, the Marshall Space Flight Center (MSFC) Technology Utilization (TU) Office, the NASA Center for Aerospace Information (CASI), the NASA COSMIC Software Center, and MSFC laboratory and contractor personnel. A complete listing of resources may be found in the bibliography of this report. Additionally, effort was made to insure that the obtained information was placed in electronic database form to insure that the subsequent updating would be feasible with minimal effort. Author

WELD FRACTURE CRITERIA FOR COMPUTER SIMULATION **c26**
Wartan A. Jemian *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

Due to the complexity of welding, not all of the important factors are always properly considered and controlled. An automatic system is required. This report outlines a simulation method and all the important considerations to do this. As in many situations where a defect or failure has occurrred, it is freqently necessary to trouble shoot the system and eventually identify those factors that were neglected. This is expensive and time consuming. Very frequently the causes are materials-related that might have been anticipated. Computer simulation can automatically consider all important variables. The major goal of this presentation is to identify the proper relationship to design, processing and materials variables to welding. Author

MEASURING THE DYNAMICS OF STRUCTURAL CHANGES IN BIOLOGICAL MACROMOLECULES FROM LIGHT SCATTERING DATA **c51**
Adriel D. Johnson *In its* The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 3 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

Examining techniques to study the dynamics of structural changes in various molecules has been an ongoing goal of the space program. Knowing how these phenomena occur in biological systems is fundamental to understanding what is necessary for life to remain functional in the space environment. A hierarchy of biological organization is functionally described when cells join together small organic molecules to form larger and more complex molecules. Characterizing the architecture of a particular macromolecule helps determine how that molecule works in the living cell and is basic to the diversity of life. Understanding this arrangement involves the correlation of the structure of macromolecules with their functions. A light scattering photometer was developed for detecting continuous measurement of the angular spectrum of light scattered by dynamically changing systems. The analysis of light scattered by biological macromolecules can be used to determine concentration, size, shape, molecular weight, and structural changes of cells, such as erythrocytes. Some light scattering photometers can collect and store 120 angular scattering spectra per minute, with an angular resolution of 0.2 deg which can be displayed with computer graphics. The light scattering photometer does the following: functions to produce and detect scattered light; determines scatter angles; and collects, stores, and analyzes data. Author (revised)

WELD JOINT CONCEPTS FOR ON-ORBIT REPAIR OF SPACE STATION FREEDOM FLUID SYSTEM TUBE ASSEMBLIES **c37**
Steven D. Jolly *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

Because Space Station Freedom (SSF) is an independent satellite, not depending upon another spacecraft for power, attitude control, or thermal regulation, it has a variety of tubular, fluid-carrying assemblies on-board. The systems of interest in this analysis provide breathing air (oxygen and nitrogen), a working fluid (two-phase anhydrous ammonia) for thermal control, and a monopropellant (hydrazine) for station reboost. The tube assemblies run both internally and externally with respect to the habitats. They are found in up to 50 ft. continuous lengths constructed of mostly AISI 316L stainless steel tubing, but also including some Inconel 625 nickel-iron and Monel 400 nickel-copper alloy tubing. The outer diameters (OD) of the tubes range from 0.25-1.25 inches, and the wall thickness between 0.028-.095 inches. The system operational pressures range from 377 psi (for the thermal control system) to 3400 psi (for the high pressure oxygen and nitrogen supply lines in the ECLSS). SSF is designed for a fifteen to thirty year mission. It is likely that the tubular assemblies (TA's) will sustain damage or fail during this lifetime such that they require repair or replacement. The nature of the damage will be combinations of punctures, chips, scratches, and creases and may be cosmetic or actually leaking. The causes of these hypothetical problems are postulated to be: (1) faulty or fatigued fluid joints--both QD's and butt-welds; (2) micro-meteoroid impacts; (3) collison with another man-made object; and (4) over-pressure strain or burst (system origin). While the current NASA baseline may be to temporarily patch the lines by clamping metal c-sections over the defect, and then perform high pressure injection of a sealing compound, it is clear that permanent repair of the line(s) is necessary. This permanent repair could be to replace the entire TA in the segment, or perhaps the segment itself, both alternatives being extremely expensive and risky. The former would likely require extensive EVA to release TA clamps and pose great risk to other engineering subsystems, and the latter would require major de-servicing of the Station. DIFFUSION ON Cu SURFACES c26
Majid Karimi *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

Understanding surface diffusion is essential in understanding surface phenomena, such as crystal growth, thin film growth, corrosion, physisorption, and chemisorption. Because of its importance, various experimental and theoretical efforts have been directed to understand this phenomena. The Field Ion Microscope (FIM) has been the major experimental tool for studying surface diffusion. FIM have been employed by various research groups to study surface diffusion of adatoms. Because of limitations of the FIM, such studies are only limited to a few surfaces: nickel, platinum, aluminum, iridium, tungsten, and rhodium. From the theoretical standpoint, various atomistic simulations are performed to study surface diffusion. In most of these calculations the Embedded Atom Method (EAM) along with the molecular static (MS) simulation are utilized. The EAM is a semi-empirical approach for modeling the interatomic interactions. The MS simulation is a technique for minimizing the total energy of a system of particles with respect to the positions of its particles. One of the objectives of this work is to develop the EAM functions for Cu and use them in conjunction with the molecular static (MS) simulation to study diffusion of a Cu atom on a perfect as well as stepped Cu(100) surfaces. This will provide a test of the validity of the EAM functions on Cu(100) surface and near the stepped environments. In particular, we construct a terrace-ledge-kink (TLK) model and calculate the migration energies of an atom on a terrace, near a ledge site, near a kink site, and going over a descending step. We have also calculated formation energies of an atom on the bare surface, a vacancy in the surface, a stepped surface, and a stepped-kink surface. Our results are compared with the available experimental and theoretical results. Author (revised)

J-INTEGRAL PATCH FOR FINITE ELEMENT ANALYSIS OF DYNAMIC FRACTURE DUE TO IMPACT OF PRESSURE VESSELS c39
Boris I. Kunin *In its* The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

Prediction of whether a pressurized cylinder will fail catastrophically when impacted by a projectile has important applications ranging from perforation of an airplane's skin by a failed turbine blade to meteorite impact of a space station habitation module. This report summarizes the accomplishment of one task for a project whose aim is to simulate numerically the outcome of a high velocity impact of pressure vessels. A finite element patch covering the vicinity of a growing crack has been constructed to estimate the J-integral (crack driving force) during the impact. Explicit expressions for the J-integral through the nodal values of displacement, strain, and stress have been written. The patch is to be used repeatedly to estimate the amount of crack growth during the time of the impact. The resulting crack size is to be compared to an estimated critical crack size for the pressurized cylinder. Author (revised)

CFD SIMULATION OF COAXIAL INJECTORS c34
D. Brian Landrum *In its* The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 6 p (For primary document see N94-24405 06-80)
Avail: CASI HC A02/MF A03

The development of improved performance models for the Space Shuttle Main Engine (SSME) is an important, ongoing program at NASA MSFC. These models allow prediction of overall system performance, as well as analysis of run-time anomalies which might adversely affect engine performance or safety. Due to the complexity of the flow fields associated with the SSME, NASA has increasingly turned to Computational Fluid Dynamics (CFD) techniques as modeling tools. An important component of the SSME system is the fuel preburner, which consists of a cylindrical chamber with a plate containing 264 coaxial injector elements at one end. A fuel rich mixture of gaseous hydrogen and liquid oxygen is injected and combusted in the chamber. This process preheats the hydrogen fuel before it enters the main combustion chamber, powers the hydrogen turbo-pump, and provides a heat dump for nozzle cooling. Issues of interest include the temperature and pressure fields at the turbine inlet and the thermal compatibility between the preburner chamber and injector plate. Performance anomalies can occur due to incomplete combustion, blocked injector ports, etc. The performance model should include the capability to simulate the effects of these anomalies. The current approach to the numerical simulation of the SSME fuel preburner flow field is to use a global model based on the MSFC sponsored FNDS code. This code does not have the capabilities of modeling several aspects of the problem such as detailed modeling of the coaxial injectors. Therefore, an effort has been initiated to develop a detailed simulation of the preburner coaxial injectors and provide gas phase boundary conditions just downstream of the injector face as input to the FDNS code. This simulation should include three-dimensional geometric effects such as proximity of injectors to baffles and chamber walls and interaction between injectors. This report describes an investigation into the numerical simulation of GH2/LOX coaxial injectors. The following sections will discuss the physical aspects of injectors, the CFD code employed, and preliminary results of a simulation of a single coaxial injector for which experimental data is available. It is hoped that this work will lay the foundation for the development of a unique and useful tool to support the SSME program. Author (revised)

STRUCTURE IN GAMMA RAY BURST TIME PROFILES: CORRELATIONS WITH OTHER OBSERVABLES c93
John Patrick Lestrade *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

One of the current debates raging in the world of gamma-ray burst physics is whether the sources of these enigmatic bursts arise from a single or from multiple distributions. Several authors contend that the histograms of GRB observables imply the latter. The two most-likely candidate components are galactic and cosmological. For example, some researchers claim that a dip in the V/V max distribution is a result of such a two-component source distribution. Others have used a parameter called the 'burst variability' calculated by dividing the maximum count rate on the 64-msec timescale by that from the 1024-msec timescale to show that a correlation of this parameter with bursts brightness implies a two-component model. This method has met vigorous criticism. We have developed two parameters that measure the variability or structure in the time profiles of BATSE gamma-ray bursts. Both parameters ('structure' and 'spike height') are based on the statistics of 'runs up' and 'runs down.' In short, the structure parameter is the observed number of runs (at several lengths) minus the number expected in a chance distribution. The 'spike height' is the sum of all run heights minus the expected sum. These two are straight-forward to calculate, robust, and measure the variability over the complete profile--not just at the peak. We have applied this algorithm to the profiles of 156 GRB's. In this paper we present graphs of the two parameters as functions of the following: (1) burst duration, (2) burst hardness ratio, (3) V/V max, (4) source galactic longitude, and (5) source galactic latitude. We seek correlations as well as groupings in the data that might indicate a multi-component source distribution. Author (revised)

SPATIAL INTERPRETATION OF NASA'S MARSHALL SPACE FLIGHT CENTER PAYLOAD OPERATIONS CONTROL CENTER USING VIRTUAL REALITY TECHNOLOGY c14
Patricia F. Lindsey *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

In its search for higher level computer interfaces and more realistic electronic simulations for measurement and spatial analysis in human factors design, NASA at MSFC is evaluating the functionality of virtual reality (VR) technology. Virtual reality simulation generates a three dimensional environment in which the participant appears to be enveloped. It is a type of interactive simulation in which humans are not only involved, but included. Virtual reality technology is still in the experimental phase, but it appears to be the next logical step after computer aided three-dimensional animation in transferring the viewer from a passive to an active role in experiencing and evaluating an environment. There is great potential for using this new technology when designing environments for more successful interaction, both with the environment and with another participant in a remote location. At the University of North Carolina, a VR simulation of a the planned Sitterson Hall, revealed a flaw in the building's design that had not been observed during examination of the more traditional building plan simulation methods on paper and on computer aided design (CAD) work station. The virtual environment enables multiple participants in remote locations to come together and interact with one another and with the environment. Each participant is capable of seeing herself and the other participants and of interacting with them within the simulated environment.

ACCESS TO SPACE STUDIES c15
James A. Martin *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 4 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

The National Aeronautics and Space Administration is currently considering possible directions in Earth-to-orbit vehicle development under a study called 'Access to Space.' This agency-wide study is considering commercial launch vehicles, human transportation, space station logistics, and other space transportation requirements over the next 40 years. Three options are being considered for human transportation: continued use of the Space Shuttle; development of a small personnel carrier (personnel logistics system (PLS)); or development of an advanced vehicle such as a single-stage-to-orbit (SSTO). Several studies related to the overall Access to Space study are reported in this document. Author (revised)

FLUX MEASUREMENTS USING THE BATSE SPECTROSCOPIC DETECTORS c93
Bernard McNamara *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

Among the Compton Gama-Ray Observatory instruments, the BATSE Spectroscopic Detectors (SD) have the distinction of being able to detect photons of energies less than about 20 keV. This is an interesting energy range for the examination of low mass X-ray binaries (LMXB's). In fact, Sco X-1, the prototype LMXB, is easily seen even in the raw BATSE spectroscopic data. The all-sky coverage afforded by these detectors offers a unique opportunity to monitor this source over time periods never before possible. The aim of this investigation was to test a number of ways in which both continous and discrete flux measurements can be obtained using the BATSE spectroscopic datasets. A instrumental description of a SD can be found in the Compton Workshop of Apr. 1989, this report will deal only with methods which can be used to analyze its datasets. Many of the items discussed below, particularly in regard to the earth occultation technique, have been developed, refined, and applied by the BATSE team to the reduction of BATSE LAD data. Code written as part of this project utilizes portions of that work. The following discussions will first address issues related to the reduction of SD datasets using the earth occultation technique. It will then discuss methods for the recovery of the flux history of strong sources while they are above the earth's limb. The report will conclude with recommended reduction procedures. INTEGRATION AND EVALUATION OF A SIMULATOR DESIGNED TO BE USED WITHIN A DYNAMIC PROTOTYPING ENVIRONMENT c14
Loretta A. Moore *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

The human computer interface (HCI) prototyping environment is designed to allow developers to rapidly prototype systems so that the interface and functionality of a system can be evaluated and iteratively refined early in the development process. This keeps development costs down by modifying the interface during the requirements definition phase, thus minimizing changes that need to be made during and after flight code development. Problems occur within a system when the user interface is not adequately developed and when designers and developers have an incomplete understanding of the system requirements. A process has been developed for prototyping on-board payload displays for Space Station Freedom. This prototyping process consists of five phases: identification of known requirements, analysis of the requirements, development of a formal design representation and specification, development of the prototype, and evaluation of the prototype. The actual development of the prototype involves prototyping the displays, developing a low fidelity simulator, building of an interface (or communication) between the displays and the simulator, integration of these components, and testing to ensure that the interface does what the developer expects. This research integrates and evaluates a software tool which has been developed to serve as a simulator within the prototyping environment. The tool is being evaluated to determine whether or not it meets the basic requirements which are needed for a low fidelity simulator within this environment. In order to evaluate the architecture and its components, a human computer interface for and a simulator of an automobile have been developed as a prototype. The individual components (i.e., the interface and simulator) have been developed, and the current research was designed to integrate and test the complete working system within the prototyping environment. The following sections will describe the architecture and components of the rapid prototyping environment, the development of a system to assess the environment, and the integration and evaluation of PERCNET.

EVALUATION OF OVOSTATIN AND OVOSTATIN ASSAY c51
Debra M. Moriarity *In its* The 1993 NASA/ASEE Summer Faculty

Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

Ovostatin is a 780,000 MW protein, originally isolated from chicken egg white, which is active as a protease inhibitor. Structural studies indicate that the protein is a tetramer of identical subunits of 165,000 MW which can be separated upon reduction with beta- mercaptoethanol. Chicken ovostatin is an inhibitor of metalloproteases such as collagenase and thermolysin, and of acid proteases such as pepsin and rennin. Ovostatin isolated from duck eggs and from crocodile eggs appears to be similar to chicken egg ovostatin, but with significant differences in structure and function. Duck ovostatin contains a reactive thiol ester which is not found in the chicken protein, and duck and crocodile ovostatin inhibit serine protease such as trypsin and chymotrypsin, while chicken ovostatin does not. Electron microscopy of ovostatin indicates that two subunits associated near the middle of each polypeptide to form a dimer with four arms. Two of these dimers then associate to produce a tetramer with eight arms, with the protease binding site near the center of the molecule. Upon binding of the protease, a conformational change causes all eight arms to curl toward the center of the molecule, effectively trapping the protease and sterically hindering access of the substrates to its active site. The structural organization and mechanism of action proposed for ovostatin are nearly identical to that proposed for alpha(sub 2)- macroglobulin, a serum protease inhibitor which may play an important role in regulation of proteases in animal tissues. Although the general arrangement of subunits appears to be the same for all ovostatins studied, some differences have been observed, with chicken ovostatin more closely resembling reptilian ovostatin than the duck protein. This is a surprising result, given the evolutionary relatedness of chickens and ducks. It is possible that the differences in structures may be due to deformed subunit arrangements which occur during the processing and fixing necessary for electron microscopy. Examination of the native structure of these proteins using X-ray crystallography would help clarify these discrepancies. Derived from text

EVALUATION OF COMPUTER-AIDED INSTRUCTION TECHNIQUES FOR THE CREW INTERFACE COORDINATION POSITION c53
Gary P. Moynihan *In its* The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

The Crew Interface Coordinator (CIC) is responsible for real-time voice and procedural communication between the payload crew on the orbiter and the payload operations team on the ground. This function is dedicated to science activities and operations, and may also include some responsibilities for crew training. CIC training at Marshall Space Flight Center (MSFC) consists of mission-independent training, mission simulations, and line-organization training. As identified by Schneider, the program provides very good generic training; however position-specific training may be obtained in a very unstructured way. A computer-based training system, identified as Mac CIC, is currently under development to address this issue. Mac CIC is intended to provide an intermediate level of training in order to prepare the CIC for the more intensive mission simulations. Although originally intended as an intelligent tutoring system, Mac CIC currently exists as a hypertext-based application. The objectives of this research is to evaluate the current system and to provide both recommendations and a detailed plan for Mac CIC's evolution into an intelligent tutoring system. ERROR CODING SIMULATIONS c32
Viveca K. Noble *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

There are various elements such as radio frequency interference (RFI) which may induce errors in data being transmitted via a satellite communication link. When a transmission is affected by interference or other error-causing elements, the transmitted data becomes indecipherable. It becomes necessary to implement techniques to recover from these disturbances. The objective of this research is to develop software which simulates error control circuits and evaluate the performance of these modules in various bit error rate environments. The results of the evaluation provide the engineer with information which helps determine the optimal error control scheme. The Consultative Committee for Space Data Systems (CCSDS) recommends the use of Reed-Solomon (RS) and convolutional encoders and Viterbi and RS decoders for error correction. The use of forward error correction techniques greatly reduces the received signal to noise needed for a certain desired bit error rate. The use of concatenated coding, e.g. inner convolutional code and outer RS code, provides even greater coding gain. The 16-bit cyclic redundancy check (CRC) code is recommended by CCSDS for error detection. Derived from text

SIMULATION OF CRYOGENIC TURBOPUMP ANNULAR SEALS c37
Alan B. Palazzolo *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

San Andres employed the NBS software package MIPROPS to account for density's dependence on pressure in the simulation of liquid annular seals. His example on a LH2 seal showed a significant change in the mass coefficient compared to a constant density model. San Andres, Yang, and Childs extended this analysis by including the pressure and temperature dependence of density, specific heat, viscosity, volumetric expansion, and thermal conductivity in a coupled solution of the energy, momentum, and continuity equations. Their example showed very significant changes in stiffness and inertia for a high speed (38,000 rpm), large L/D ratio (0.5) LOX seal, as compared to their constant temperature results. The current research rederived the San Andres-Yang-Childs (SYC) analysis and extended it to include not only the Moody friction model of SYC but also the Hir's friction model. The derivation begins with obtaining the local differential equations of continuity, momentum, and energy conservation in the seal. These equations are averaged across the film thickness to obtain the resulting 'bulk flow' differential equations. Shear stress and convective heat loss through the stator (seal) and rotor are related to the Moody and Hir's friction factor model. The Holman analogy is employed to relate heat conduction in or out of the fluid film's boundary layer to the friction induced shear stress. Derived from text

CONTROLLER MODELING AND EVALUATION FOR PCV ELECTRO-MECHANICAL ACTUATOR c37
Joey K. Parker *In its* The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

Hydraulic actuators are currently used to operate the propellant control valves (PCV) for the space shuttle main engine (SSME) and other rocket engines. These actuators are characterized by large power to weight ratios, large force capabilities, and rapid accelerations, which favor their use in control valve applications. However, hydraulic systems are also characterized by susceptibility to contamination, which leads to frequent maintenance requirements. The Control Mechanisms Branch (EP34) of the Component Development Division of the Propulsion Laboratory at the Marshall Space Flight Center (MSFC) has been investigating the application of electromechanical actuators as replacements for the hydraulic units in PCV's over the last few years. This report deals with some testing and analysis of a PCV electromechanical actuator (EMA) designed and fabricated by HR Textron, Inc. This prototype actuator has undergone extensive testing by EP34 personnel since early 1993. At this time, the performance of the HR Textron PCV EMA does not meet requirements for position tracking. THE MEASUREMENT AND ANALYSIS OF LEAF SPECTRAL REFLECTANCE OF TWO STANDS OF LOBLOLLY PINE POPULATIONS c43
Anthony D. Paul *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 2 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

My research was conducted under the mentorship of Dr. Jeff Luvall. I worked at Marshall from June 1 through August 6, 1993. My proposal is titled 'The Measurement and Analysis of Leaf Spectral Reflectance of Two Stands of Loblolly Pine Populations.' The populations for this study were chosen from a larger population of 31 families managed by the International Forest Seed Company, Odenville, Alabama. The technology for mobile ground base spectral detecting is new and therefore the majority of time, June 2 through July 9, was spent on learning the techniques of the Spectrometer 2 spectroradiometer used in the gathering of spectra information. The activities included in the learning process were as follows: calibration of the equipment, programming the associated computer for data management, operation of the spectral devices, and input and output of data. From July 12 through August 3 the time was spent on learning the 'STATGRAP' computer software. This software will be used in the analysis of the data retrieved by the Spectrometer 2 spectroradiometer. Dr. Greg Carter, at Stennis, a colleague of Dr. Luvall, has been conducting similar work with different instruments and procedures and has agreed to host us for a training session on data gathering and analysis. This visit, which has previously planned for July 9, 1993, but had to be postponed because of schedule conflicts, is now confirmed for August 18-22, 1993. This trip to Stennis will provide the knowledge for conducting the field operations in my study, i.e., gathering of data and file conversions.

LRAT: LIGHTNING RADIATIVE TRANSFER **c47**

Dieudonne D. Phanord *In its* The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)

Avail: CASI HC A01/MF A03

In this report, we extend to cloud physics the work done for single and multiple scattering of electromagnetic waves. We consider the scattering of light, visible or infrared, by a spherical cloud represented by a statistically homogeneous ensemble of configurations of N identical spherical water droplets whose centers are uniformly distributed in its volume V. The ensemble is specified by the average number rho of scatterers in unit volume and by rho f(R) with f(R) as the distribution function for separations R of pairs. The incident light, vector-phi(sub 0) a plane electromagnetic wave with harmonic time dependence, is from outside the cloud. The propagation parameter kappa(sub 0) and the index of refraction eta(sub 0) determine physically the medium outside the distribution of scatterers. We solve the interior problem separately to obtain the bulk parameters for the scatterer equivalent to the ensemble of spherical droplets. With the interior solution or the equivalent medium approach, the multiple scattering problem is reduced to that of an equivalent single scatterer excited from outside illumination. A dispersion relation which determines the bulk propagation parameter K and the bulk index of refraction eta of the cloud is given in terms of the vector equivalent scattering amplitude vector-G and the dyadic scattering amplitude tilde-g of the single object in isolation. Based on this transfer model we will have the ability to consider clouds composed of inhomogeneous distribution of water and/or ice particles and we will be able to take into account particle size distributions within the cloud. We will also be able to study the effects of cloud composition (i.e., particle shape, size, composition, orientation, location) on the polarization of the single or the multiple scattered waves. Finally, this study will provide a new starting point for studying the problem of lightning radiative transfer.

SPACE SHUTTLE MAIN ENGINE PERFORMANCE ANALYSIS **c20**

L. Michael Santi *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)

Avail: CASI HC A01/MF A03

For a number of years, NASA has relied primarily upon periodically updated versions of Rocketdyne's power balance model (PBM) to provide space shuttle main engine (SSME) steady-state performance prediction. A recent computational study indicated that PBM predictions do not satisfy fundamental energy conservation principles. More recently, SSME test results provided by the Technology Test Bed (TTB) program have indicated significant discrepancies between PBM flow and temperature predictions and TTB observations. Results of these investigations have diminished confidence in the predictions provided by PBM, and motivated the development of new computational tools for supporting SSME performance analysis. A multivariate least squares regression algorithm was developed and implemented during this effort in order to efficiently characterize TTB data. This procedure, called the 'gains model,' was used to approximate the variation of SSME performance parameters such as flow rate, pressure, temperature, speed, and assorted hardware characteristics in terms of six assumed independent influences. These six influences were engine power level, mixture ratio, fuel inlet pressure and temperature, and oxidizer inlet pressure and temperature. A BFGS optimization algorithm provided the base procedure for determining regression coefficients for both linear and full quadratic approximations of parameter variation. Statistical information relative to data deviation from regression derived relations was also computed. A new strategy for integrating test data with theoretical performance prediction was also investigated. The current integration procedure employed by PBM treats test data as pristine and adjusts hardware characteristics in a heuristic manner to achieve engine balance. Within PBM, this integration procedure is called 'data reduction.' By contrast, the new data integration procedure, termed 'reconciliation,' uses mathematical optimization techniques, and requires both measurement and balance uncertainty estimates. The reconciler attempts to select operational parameters that minimize the difference between theoretical prediction and observation. Selected values are further constrained to fall within measurement uncertainty limits and to satisfy fundamental physical relations (mass conservation, energy conservation, pressure drop relations, etc.) within uncertainty estimates for all SSME subsystems. The parameter selection problem described above is a traditional nonlinear programming problem. The reconciler employs a mixed penalty method to determine optimum values of SSME operating parameters associated with this problem formulation.

EVALUATION OF THE EFFICIENCY AND FAULT DENSITY OF SOFTWARE GENERATED BY CODE GENERATORS **c61**

Barbara Schreur *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 4 p (For primary document see N94-24405 06-80)

Avail: CASI HC A01/MF A03

Flight computers and flight software are used for GN&C (guidance, navigation, and control), engine controllers, and avionics during missions. The software development requires the generation of a considerable amount of code. The engineers who generate the code make mistakes and the generation of a large body of code with high reliability requires considerable time. Computer-aided software engineering (CASE) tools are available which generates code automatically with inputs through graphical interfaces. These tools are referred to as code generators. In theory, code generators could write highly reliable code quickly and inexpensively. The various code generators offer different levels of reliability checking. Some check only the finished product while some allow checking of individual modules and combined sets of modules as well. Considering NASA's requirement for reliability, an in house manually generated code is needed. Furthermore, automatically generated code is reputed to be as efficient as the best manually generated code when executed. In house verification is warranted.

MICROMECHANICAL SIMULATION OF DAMAGE PROGRESSION IN CARBON PHENOLIC COMPOSITES **c24**

Kerry T. Slattery *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)

Avail: CASI HC A01/MF A03

Carbon/phenolic composites are used extensively as ablative insulating materials in the nozzle region of solid rocket motors. The current solid rocket motor (RSRM) on the space shuttle is fabricated from woven rayon cloth which is carbonized and then impregnated with the phenolic resin. These plies are layed up in the desired configuration and cured to form the finished part. During firing, the surface of the carbon/phenolic insulation is exposed to 5000 F gases from the rocket exhaust. The resin pyrolizes and the material chars to a depth which progresses with time. The rate of charring and erosion are generally predictable, and the insulation depth is designed to allow adequate safety margins over the firing time of the motor. However, anomalies in the properties and response of the carbon/phenolic materials can lead to severe material damage which may decrease safety margins to unacceptable levels. Three macro damage modes which were observed in fired nozzles are: ply lift, 'wedge out', and pocketing erosion. Ply lift occurs in materials with plies oriented nearly parallel to the surface. The damage occurs in a region below the charred material where material temperatures are relatively low - about 500 F. Wedge out occurs at the intersection of nozzle components whose plies are oriented at about 45 deg. The corner of the block of material breaks off along a ply interface. Pocketing erosion occurs in material with plies oriented normal to the surface. Thermal expansion is restrained in two directions resulting in large tensile strains and material failure normal to the surface. When a large section of material is removed as a result of damage, the insulation thickness is reduced which may lead to failure of the nozzle due to excessive heating of critical components. If these damage events cannot be prevented with certainty, the designer must increase the thickness of the insulator thus adding to both weight and cost. One of the difficulties in developing a full understanding of these macro damage mechanisms is that the loading environment and the material response to that environment are extremely complex. These types of damage are usually only observed in actual motor firings. Therefore, it is difficult and expensive to evaluate the reliability of new materials. Standard material tests which measure mechanical and thermal properties of test specimens can only provide a partial picture of how the material will respond in the service environment. The development of the ANALOG test procedure which can combine high heating rates and mechanical loads on a specimen will improve the understanding of the interactive effects of the various loads on the system. But a mechanistic model of material response which can account for the heterogeneity of the material, the progression of various micromechanical damage mechanisms, and the interaction of mechanical and thermal stresses on the material is required to accurately correlate material tests with response to service environments. A model based on fundamental damage mechanisms which is calibrated and verified under a variety of loading conditions will provide a general tool for predicting the response of rocket nozzles. The development of a micromechanical simulation technique was initiated and demonstrated to be effective for studying across-ply tensile failure of carbon/phenolic composites. Author (revised)

A CHEMICAL SENSOR AND BIOSENSOR BASED TOTALLY AUTOMATED WATER QUALITY MONITOR FOR EXTENDED SPACE FLIGHT: STEP 1 c54
Robert S. Smith *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

The result of a literature search to consider what technologies should be represented in a totally automated water quality monitor for extended space flight is presented. It is the result of the first summer in a three year JOVE project. The next step will be to build a test platform at the Authors' school, St. John Fisher College. This will involve undergraduates in NASA related research. The test flow injection analysis system will be used to test the detection limit of sensors and the performance of sensors in groups. Sensor companies and research groups will be encouraged to produce sensors which are not currently available and are needed for this project. Author (revised)

MICROSTRUCTURAL ANALYSIS OF THE 2195 ALUMINUM-LITHIUM ALLOY WELDS c26
George E. Talia *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

The principal objective of this research was to explain a tendency of 2195 Al-Li alloy to crack at elevated temperature during welding. Therefore, a study was made on the effect of welding and thermal treatment on the microstructure of Al-Li Alloy 2195. The critical roles of precipitates, boundaries, phases, and other features of the microstructure were inferred from the crack propagation paths and the morphology of fracture surface of the alloy with different microstructures. Particular emphasis was placed on the microstructures generated by the welding process and the mechanisms of crack propagation in such structures. Variation of the welding parameters and thermal treatments were used to alter the micro/macro structures, and they were characterized by optical and scanning electron microscopy. A theoretical model is proposed to explain changes in the microstructure of welded material. This model proposes a chemical reaction in which gases from the air (i.e., nitrogen) release hydrogen inside the alloy. Such a reaction could generate large internal stresses capable to induce porosity and crack-like delamination in the material. Author

TORQUE EQUILIBRIUM ATTITUDES FOR THE SPACE STATION c18
Roger C. Thompson *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

All spacecraft orbiting in a low earth orbit (LEO) experience external torques due to environmental effects. Examples of these torques include those induced by aerodynamic, gravity-gradient, and solar forces. It is the gravity-gradient and aerodynamic torques that produce the greatest disturbances to the attitude of a spacecraft in LEO, and large asymmetric spacecraft, such as the space station, are affected to a greater degree because the magnitude of the torques will, in general, be larger in proportion to the moments of inertia. If left unchecked, these torques would cause the attitude of the space station to oscillate in a complex manner and the resulting motion would destroy the micro-gravity environment as well as prohibit the orbiter from docking. The application of control torques will maintain the proper attitude, but the controllers have limited momentum capacity. When any controller reaches its limit, propellant must then be used while the device is reset to a zero or negatively-biased momentum state. Consequently, the rate at which momentum is accumulated is a significant factor in the amount of propellant used and the frequency of resupply necessary to operate the station. A torque profile in which the area curve for a positive torque is not equal to the area under the curve for a negative torque is 'biased,' and the consequent momentum build-up about that axis is defined as secular momentum because it continues to grow with time. Conversely, when the areas are equal, the momentum is cyclic and bounded. A Torque Equilibrium Attitude (TEA) is thus defined as an attitude at which the external torques 'balance' each other as much as possible, and which will result in lower momentum growth in the controllers. Ideally, the positive and negative external moments experienced by a spacecraft at the TEA would exactly cancel each other out and small cyclic control torques would be required only for precise attitude control. Over time, the only momentum build-up in the controllers would be due to electro-mechanical losses within the device. However, the atmospheric torques are proportional to the density of the atmosphere and the density varies with the orbital position, time of day, time of year, and the solar cycle. In addition, there are unmodeled disturbances and uncertainties in the mass and inertias. Therefore, there is no constant attitude that will completely balance the environmental torques and the dynamic TEA cannot be solved in closed form. The objective of this research was to determine a method to calculate a dynamic TEA such that the rate of momentum build-up in the controllers would be minimized and to implement this method in the MATRIX(x) simulation software by Integrated Systems, Inc. PROPERTIES AND PROCESSING CHARACTERISTICS OF LOW DENSITY CARBON CLOTH PHENOLIC COMPOSITES c24
C. Jeff Wang *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

Ply-lift and pocketing are two critical anomalies of carbon cloth phenolic composites (CCPC) in rocket nozzle applications. Ply lift occurs at low temperatures when the A/P and in-plane permeabilities of the composite materials are still very low and in-plane porous paths are blocked. Pocketing occurs at elevated temperatures when in-plane permeability is reduced by the A/P compressive stress. The thermostructural response of CCPC in a rapid heating environment involves simultaneous heat, mass, and momentum transfer along with the degradation of phenolic resin in a multiphase system with temperature- and time-dependent material properties as well as dynamic processing conditions. Three temperature regions represent the consequent chemical reactions, material transformations, and property transitions, and provide a quick qualitative method for characterizing the thermostructural behavior of a CCPC. In order to optimize the FM5939 LDCCP (low density carbon cloth phenolic) for the nozzle performance required in the Advanced Solid Rocket Motor (ASRM) program, a fundamental study on LDCCP materials was conducted. The cured composite has a density of 1.0 +/- 0.5 gm/cc which includes 10 to 25 percent void volume. The weight percent of carbon microballoon is low (7-15 percent). However, they account for approximately one third of the volume and historically their percentages have not been controlled very tightly. In addition, the composite properties show no correlation with microballoon weight percent or fiber properties (e.g. fiber density or fiber moisture adsorption capacity). Test results concerning the ply-lift anomaly in the MNASA motor firings were: (1) Steeper ply angle (shorter path lenght) designs minimized/eliminated by lifting, (2) material with higher void volume ply lifted less frequently, (3) materials with high (greater than 9 percent) microballoon content had a higher rate of ply lifting, and (4) LDCCP materials failed at microballoon-resin interfaces. The objectives of this project are: (1) to investigate the effects of carbon microballoon and cabosil fillers as well as fiber heat treatment on plylift-related mechanical properties, (2) to develop a science-based thermostructural process model for the carbon phenolics. The model can be used in the future for the selection of the improved ASRM materials, (3) to develop the micro-failure mechanisms for the ply-lift initiation and propagation processes during the thermoelastic region of phenolic degradation, i.e. postcuring and devolatilization. EFFECTS OF THERMAL-SOLUTAL CONVECTION ON TEMPERATURE AND SOLUTAL FIELDS UNDER VARIOUS GRAVITATIONAL ORIENTATIONS c29

Jai-Ching Wang *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)

Avail: CASI HC A01/MF A03

Semiconductor crystals such as Hg(1-x)CD(x)Te grown by unidirectional solidification Bridgmann method have shown compositional segregations in both the axial and radial directions. Due to the wide separation between the liquidus and the solidus of its pseudobinary phase diagram, there is a diffusion layer of higher HgTe content built up in the melt near the melt-solid interface which gives a solute concentration gradient in the axial direction. The value of effective diffusion coefficient calculated from fitting of the data to 1D model varies with Hg(1-x)Cd(x)Te growth conditions. This indicates that the growth condition of the Hg(1-x)Cd(x)Te is not purely diffusion controlled. Because of the higher thermal conductivity in the melt than that in the crystal in the growth system, there is a thermal leakage through the fused silica crucible wall near the melt-solid interface. This gives a thermal gradient in the radial direction. Hart, and Thorpe, Hutt and Soulsby have shown that under such conditon a fluid will become convectively unstable as a result of different diffusitivities of temperature and solute. It is quite important to understand the effects of this thermosolute convection on the compositonal segregation in both axial and radial directions in the unidirectionally solidified crystals under various gravitational directions. To reach this goal, we start with a simplified problem to study the effects of thermal-solutal convection on the temperature and solutal fields under various gravitional orientations. We begin by reviewing model governing equations. Author (revised)

USING NEURAL NETWORKS TO ASSIST IN OPAD DATA ANALYSIS c63

Kevin W. Whitaker *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)

Avail: CASI HC A01/MF A03

The space shuttle main engine (SSME) became the subject of plume emission spectroscopy in 1986 when researchers from NASA-Marshall Space Flight Center (MSFC), Arnold Engineering Development Center (AEDC), and Rocketdyne went to the SSME test stands at the NASA-Stennis Space Center and at Rocketdyne's Santa Susan Field Laboratory to optically observe the plume. Since then, plume spectral acquisitions have recorded many nominal tests and the qualitative spectral features of the SSME plume are now well established. Significant discoveries made with both wide-band and narrow-band plume emission spectroscopy systems led MSFC to promote the Optical Plume Anomaly Detection (OPAD) program with a goal of instrumenting all SSME test stands with customized spectrometer systems. A prototype OPAD system is now installed on the SSME Technology Test Bed (TTB) at MSFC. The OPAD system instrumentation consists of a broad-band, optical multiple-channel analyzer (OMA) and a narrow-band device called a polychrometer. The OMA is a high-resolution (1.5-2.0 Angstroms) 'super-spectrometer' covering the near-ultraviolet to near-infrared waveband (2800-7400 Angstroms), providing two scans per second. The polychrometer consists of sixteen narrow-band radiometers: fourteen monitoring discrete wavelengths of health and condition monitoring elements and two dedicated to monitoring background emissions. All sixteen channels are capable of providing 500 samples per second. To date, the prototype OPAD system has been used during 43 SSME firings on the TTB, collecting well over 250 megabytes of plume spectral data. One goal of OPAD data analysis is to determine interatively with the help of a computer code, SPECTRA4, developed at AEDC. Experience has shown that iteration with SPECTRA4 is an incredibly labor intensive task and not one to be performed by band. What is really needed is the 'inverse' of SPECTRA4 but the mathematical model for this inverse mapping is tenuous at best. However, the robustness of PSECTRA4 run in the 'forward' direction means that accurate input/output mappings can be obtained. If the mappings were inverted (i.e., input becomes output and output becomes input) then an 'inverse' of SPECTRA4 would be at hand but the 'model' would be specific to the data utilized and would in no way be general. Building a generalized model based upon known input/output mappings while ignoring the details of the governing physical model is possible through the use of a neural network. The research investigation described involves the development of a neural network to provide a generalized 'inverse' of SPECTRA4. The objectives of the research were to design an appropriate neural network architecture, train the network, and then evaluate its performance. Author (revised)

THE FAR ULTRAVIOLET (FUV) AURORAL IMAGER FOR THE INNER MAGNETOSPHERIC IMAGER (IMI) MISSION: OPTIONS c19

Gordon R. Wilson *In its* The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)

Avail: CASI HC A01/MF A03

The change from an intermediate mission (cost ceiling of $300 million) to a solar-terrestrial probe class mission (cost ceiling of $150 million) will require some major changes in the configuration of the IMI mission. One option being considered is to move to a small spin-stabilized spacecraft (with no despun platform) which could be launched with a smaller Taurus or Conestoga class booster. Such a change in spacecraft type would not present any fundamental problems (other than restrictions on mass and power) for the He plus 304 A plasmasphere imager, the high and low energy neutral atom imagers, and the geocoronal imager, but would present a challenge for the FUV auroral imager since the original plan called for this instrument to operate from a despun platform. Since the FUV instrument is part of the core payload it cannot be dropped from the instrument complement without jeopardizing the science goals of the mission. A way must be found to keep this instrument and to allow it to accomplish most, if not all, of its science objectives. One of the subjects discussed are options for building an FUV instrument for a spinning spacecraft. Since a number of spinning spacecraft have carried auroral imagers, a range of techniques exists. In addition, the option of flying the FUV imager on a separate micro-satellite launched with the main IMI spacecraft or with a separate pegasus launch, was considered and is discussed. EVALUATION OF ADVANCED MATERIALS THROUGH EXPERIMENTAL MECHANICS AND MODELLING c38

Yii-Ching Yang *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

Composite materials have been frequently used in aerospace vehicles. Very often defects are inherited during the manufacture and damages are inherited during the construction and services. It becomes critical to understand the mechanical behavior of such composite structure before it can be further used. One good example of these composite structures is the cylindrical bottle of solid rocket motor case with accidental impact damages. Since the replacement of this cylindrical bottle is expensive, it is valuable to know how the damages affects the material, and how it can be repaired. To reach this goal, the damage must be characterized and the stress/strain field must be carefully analyzed. First the damage area, due to impact, is surveyed and identified with a shearography technique which uses the principle of speckle shearing interferometry to measure displacement gradient. Within the damage area of a composite laminate, such as the bottle of solid rocket motor case, all layers are considered to be degraded. Once a lamina being degraded the stiffness as well as strength will be drastically decreased. It becomes a critical area of failure to the whole bottle. And hence the stress/strain field within and around a damage should be accurately evaluated for failure prediction. To investigate the stress/strain field around damages a Hybrid-Numerical method which combines experimental measurement and finite element analysis is used. It is known the stress or strain at the singular point can not be accurately measured by an experimental technique. Nevertheless, if the location is far away from the singular spot, the displacement can be found accurately. Since it reflects the true displacement field locally regardless of the boundary conditions, it is an excellent input data for a finite element analysis to replace the usually assumed boundary conditions. Therefore, the Hybrid-Numerical method is chosen to avoid the difficulty and to take advantage of both experimental technique and finite element analysis. Experimentally, the digital image correlation technique is employed to measure the displacement field. It is done by comparing two digitized images, before and after loading. Numerically, the finite element program, ABAQUS (version 5.2), is used to analyze the stress and strain field. It takes advantage of the high speed and huge memory size of modern supercomputer, CRAY Y-MP, at NASA Marshall Space Flight Center.

USING CONTOUR MAPS TO SEARCH FOR RED-SHIFTED 511 keV FEATURES IN BATSE GRB SPECTRA c89
Peter G. Varmette *In* Alabama Univ., The 1993 NASA/ASEE Summer Faculty Fellowship Program Nov. 1993 5 p (For primary document see N94-24405 06-80)
Avail: CASI HC A01/MF A03

Since their discovery twenty years ago, the origin of gamma-ray bursts (GRB's) has remained an intriguing mystery. The quest to understand these objects has given rise to a plethora of competing theories. Several theories suggest that GRB's are galactic in origin while others suggest that GRB's are cosmological. One piece of evidence that might provide scientistis with a key to understanding the origin of GRB's may be whether or not spectral emission and absorption features exist in burst spectra. If the features exist and can be attributed to either cyclotron lines or to red-shifted 511 keV annihilation lines then credence would be given to those theories that support a galactic origin, i.e. near neutron stars. A method of searching for spectral features in burst spectra (BATSE HER data) is outlined.

WOMEN SCIENTISTS AND ENGINEERS EMPLOYED IN INDUSTRY: WHY SO FEW? A REPORT BASED ON A CONFERENCE
1994 140 p
(ISBN-0-309-04991-1; LC-93-86930) Copyright Avail: Issuing Activity

Women comprise about 12 percent of the employed scientific and engineering (S&E) labor force in industry. While this is due in part to specific sub-fields selected by women, another significant contributing factor is the attrition rate for women scientists and engineers in industry, which is double that for men and substantially higher than for other employment sectors. These compelling facts led the Committee on Women in Science and Engineering (CWSE) of the National Research Council to plan a conference, 'Women Scientists and Engineers Employed in Industry: Why So Few?,' to examine the workplace environment for women pursuing careers in industry. The conference provided a forum for women scientists and engineers to share data and personal experiences to uncover the principal causes of underrepresentation of S&E women in industry and to explore effective strategies for change. In addition, representatives of five companies having established exemplary programs to recruit and retain women scientists and engineers - Aerospace Corporation, ALCOA, AT&T Bell Laboratories, Xerox Corporate Research and Technology, and Scios Nova - described strategies proven to be effective in removing barriers for women scientists and engineers.

PERSONNEL SHIFT ASSIGNMENT: EXISTENCE CONDITIONS AND NETWORK MODELS
Joeren vandenBerg and David M. Panton (University of South Australia, Pooraka.) Feb. 1993 21 p
(MEMO-1116; ETN-94-94752) Avail: CASI HC A03/MF A01

The personnel scheduling problem is known to be a five stage process in which the final stage involves the assignment of shifts to the days worked in the schedule. The existence conditions for both continuous and forward rotating shift assignments and heuristic network algorithms for the determination of such assignments are discussed. Results generated for a number of test problems demonstrate that the network devised to search for continous solutions produces these solutions in a high proportion of cases where such solutions are known to exist. For more general problems the algorithm is shown to be efficient in its ability to generate either continuous or rotating solutions.

FRAMEWORK FOR INTERACTIVE SOLVING OF META-CONSTRAINT

SATISFACTION PROBLEMS
F. J. Juengen and W. Kowalczyk Dec. 1992 24 p
(PB94-118825; IR-312) Avail: CASI HC A03/MF A01

This report presents a framework for solving Meta-Constraint Satisfaction Problems (MCSP's). The process of solving a MCSP interactively is viewed here as a user-driven search in an abstract search space. This search space consists of a collection of states which are represented by pairs of the form (set of constraints, partial valuation). The user can travel through the states by applying some transformations to states. To provide a better insight into the states, a number of their properties is measured and reported to the user. The goal of the search process is to find a state which satisfies some (implicit) meta-constraints. In particular, the result of the search process may consist of an incomplete (or even inconsistent) solution of a set of constraints. A special module, called Navigator, is used to allow the user to traverse the states already visited in an easy manner (these states are arranged in a tree). The usefulness of the framework is illustrated by an Interactive Project Scheduler. NTIS

MODULAR APPROACH TO PROJECT MANAGEMENT
Frederik-Jan Juengen and Wojciech Kowalczyk Dec. 1992 46 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-118833; IR-313) Avail: Issuing Activity (National Technical Information Service (NTIS))

The report provides a detailed analysis of project management. A number of desired functionalities of an 'ideal' project management system is identified and some suggestions are made concerning the implementations of these functionalities. Moreover, a methodology for developing complex systems for tasks like project management is outlined. The methodology is based on three principles: modularity, re-usability and incremental system development. The applicability of the methodology is illustrated by the development of a project management system. A number of generic modules have been implemented and configured into a powerful scheduling system for network planning, Interactive Project Scheduler (IPS). Two possible applications of the IPS have been discussed: in the building industry and software development projects. It is expected that our system will be extended by modules supporting other phases of project management, especially resources monitoring. NTIS

SEMATECH, A CASE STUDY: ANALYSIS OF A GOVERNMENT-INDUSTRY PARTNERSHIP M.S. Thesis
Robert M. Byron 23 Sep. 1993 109 p
(AD-A273166) Avail: CASI HC A06/MF A02

SEMATECH proponents argue that the SEMATECH consortium model represents future government-industry consortia. This thesis examines the Semiconductor Manufacturing Technology Initiative (SEMATECH). Analysis of SEMATECH includes the following: (1) its dissection as a consortium and as a government-industry venture; (2) the impact of SEMATECH on both semiconductor research and development (R&D) and the American chipmaking industry; and (3) the political implications of SEMATECH. SEMATECH is funded through the Advanced Research Programs Agency (ARPA). Federal support of the semiconductor industry via ARPA seems incompatible with Department of Defense interests. There are instances when federal support of R&D is justified. It seems doubtful that the semiconductor industry is one of those instances, but if it were, SEMATECH would not be the best way to channel government support. This thesis shows that SEMATECH is not responsible for the turnaround of the semiconductor industry; that SEMATECH is not an appropriate model for government-industry partnerships; and that federal funding of SEMATECH should cease. THE INCREASE OF THE CONTROLLABILITY OF PRODUCTION ORGANIZATIONS Ph.D. Thesis [HET VERGROTEN VAN DE BESTUURBAARHEID VAN PRODUKTIE-ORGANISATIES]
Petrus J. L. M. vanAmelsvoort 1992 188 p In DUTCH
(ISBN-9-03-860161-1; ETN-94-95291) Copyright Avail: CASI HC A09/MF A02

A model for the control structure of a flexible organization was developed, in view of the increased pressure on companies for higher demands with regard to efficiency, quality and flexibility. The model is based on the sociotechnical theory, in which attention is focused on the structure of production process in which the concept of a (semi)autonomous group plays an important role. In the process of developing the model, a number of gaps revealed in existing models were filled. A balance model of controllability based on the law of requisite variety was developed. The control model consists of autonomous teams that each control a particular part of the production process. Criteria were defined to determine the desired location of control possibilities. Proceeding on the basis of the principle of minimum possible division of labor, an efficient modular control structure is obtained. ESA

The cost of designing, producing, and operating typical aerospace flight hardware is necessarily more expensive than most other human endeavors. Because of the more stringent environment of space, hardware designed to operate there will probably always be more expensive than similar hardware which is designed for less taxing environments. It is the thesis of this study that there are very significant improvements that can be made in the cost of aerospace flight hardware. Derived from text

PRODUCTION CONTROL AND DEMAND MANAGEMENT IN CAPACITATED FLOW PROCESS INDUSTRIES Ph.D. Thesis
Jan Cornelis Fransoo 1993 134 p Sponsored by Netherlands Organization for Applied Scientific Research
(ISBN-9-03-860211-1; ETN-94-95299) Copyright Avail: CASI HC A07/MF A02

A single machine multiproduct production system under tight capacity constraints is studied. Focus is on the production control function in such a system. Both the managerial aspects and the scheduling aspects of the problem are addressed. The practical relevance of studying such a system originated from process industries. To enable a detailed analysis of production control in flow process industries to be made, the elementary flow process industries production system was defined. The production control concept developed was built up from a simple uncomplicated model to a more comprehensive and complicated model, links to the real life flow process industries environment being provided. The hierarchical structure of the specific concept developed was analyzed and its methodology studied in comparison with more general hierarchical approaches from the literature. The practical consequences of the concept and the necessary adjustment made to the concept on implementation in a glass factory are illustrated. ESA

RELEVANT COSTS OR FULL COSTS? EXPLAINING WHY MANAGERS USE CAPACITY COST ALLOCATIONS FOR SHORT TERM DECISIONS Ph.D. Thesis

Marcus Johannes F. Wouters 1993 222 p
(ISBN-9-06-215364-X; ETN-94-95303) Copyright Avail: CASI HC A10/MF A03

A study whose main purpose is to explain why managers would sometimes follow a full cost approach to capacity utilization decisions is reported. The usefulness for managers of allocating capacity costs to activities when capacity utilization decisions are made is investigated. Some systematic empirical evidence that managers do, in fact, follow a full cost approach to capacity utilization decisions is provided. A contribution to contemporary discussions, in the context of ABC, on the use of allocated costs for short term decision making, is made. It is noted that an activity yields a contribution margin and uses capacity. The latter consequence may lead to costs associated with foregone opportunities (because other activities cannot be implemented) or costs associated with additional capacity (because capacity expansion is required or because capacity reduction is obstructed). In a relevant cost approach these costs are compared with the contribution margin. In a full cost approach the contribution margin is related to an allocated share of the total capacity costs. ESA

THROUGHPUT TIME CONTROL AND DUE DATE RELIABILITY IN TOOL AND DIE SHOPS Ph.D. Thesis

Antonius Maria vandeWakker 1993 289 p
(ISBN-9-03-860182-4; ETN-94-95349) Copyright Avail: CASI HC A13/MF A03

The results of a study into the production planning and control issues involved in manufacturing multiple discrete products in the component manufacturing units of tool and die shops are presented. Special attention is given to designing approaches to the following three planning and control decisions: due date assignment: how to be able to promise short and reliable throughput times; order release: when should the manufacturing unit receive an order; work sequencing: which manufacturing order should be given the highest priority at a given work station. The study focuses on designing a set of planning and control rules to be used as the basis for making the planning and control decisions mentioned above. These decision rules are intended to provide an optimal performance mix with respect to achieving a high level of due date reliability and a short average throughput time for assembly orders. ESA

Different kinds of organization autonomies and their practical effects on cooperation between organizations and on Electronic Data Interchange (EDI) between them are studied. The most obvious problems for organizations in their EDI activities currently concern the integration of EDI into existing data processing systems. Current standards give no solution to this practical problem, since attention is essentially directed to the description of data exchanged by organizations. A reference architecture developed to resolve these problems is proposed. The basic hypothesis of this architecture is that organization autonomy and in consequence choice of data processing system, are in no way restricted. On the other hand, an abstract local interface is defined between the standardized zone and local zone of organizations. The definition of this interface can be standardized as has been done in the OSI (Open Systems Interconnection) model, but the realization of the interface depends on the organizations themselves. Typically, applications are built only after the database schema is available. To enable the application designer/programmer with the tools necessary to forge ahead without having to wait for the data schema definition, a change from traditional methodologies must take place. An alternate design methodology intended to bring applications on-line as soon as possible is proposed. Inmon's paradigm is looked at for decision support systems and tying it together with Martin's subject databases used in a distributed data system. DOE

AN INFORMATION RETRIEVAL LOGICAL MODEL APPLIED TO THE FORMALISM OF CONCEPTUAL GRAPHS: THE ELEN PROTOTYPE AND ITS EXPERIMENTATION ON A CORPUS OF SOFTWARE COMPONENTS Ph.D. Thesis [UN MODELE LOGIQUE DE RECHERCHE D'INFORMATIONS APPLIQUE AU FORMALISME DES GRAPHES CONCEPTUELS: LE PROTOTYPE ELEN ET SON EXPERIMENTATION SUR UN CORPUS DE COMPOSANTS LOGICIELS]
Jean-Pierre Chevallet 1992 195 p In FRENCH
(ETN-94-95162) Avail: CASI HC A09/MF A03

An information retrieval system was developed using a cluster indexing formalism based on the Sowa conceptual graphs. The purpose of the system was to retrieve accurate answers. The semantics was evaluated by a first order fuzzy model. An optimal research mechanism based on graph signatures is presented. The ELEN (French acronym for information retrieval and software engineering) prototype project is part of a main program involving the design and the development of database applications for software. ELEN is in fact a database for software. The software engineering aspects applying component research are reviewed. The logic model chosen is extended in order to satisfy the indexing formalism. Proposals, fuzzy and first order fuzzy modal logics are discussed. The indexing formalism, based on the knowledge of semantic networks and named conceptual graphs, are described. The results and the performance of the prototype system are discussed. ESA

A GENERAL MODEL FOR DYNAMIC AND COMPLEX INFORMATION MANAGEMENT: THE ELEN PROTOTYPE OBJECT MANAGER FOR SOFTWARE ENGINEERING Ph.D. Thesis [UN MODELE GENERIQUE POUR LA GESTION DES INFORMATIONS COMPLEXES ET DYNAMIQUES: GESTIONNAIRE D'OBJETS DU PROTOTYPE ELEN DEDIE AU GENIE LOGICIEL]
Sahar Jarwah 1992 210 p In FRENCH
(ETN-94-95163) Avail: CASI HC A10/MF A03

The purpose of the study was to develop a tool to support large scale softwares. The ELEN (French acronym for information retrieval and software engineering) prototype is part of a program involving the design and the development of data base applications. ELEN is a software database for software. A general storage and management core which allows the integration of information sets and which uses declaratory tools is defined. The project manager is capable of specifying the searched development method or strategy. A data model for hypertext systems, capable of generating logic software information, is presented. The model uses object oriented semantics and integrates dynamic and static aspects of software engineering. Available object oriented data and procedures were used. The conditions required to activate and to control the object's behavior are summarized. ESA

STRUCTURE AND FLOW OF DATA THROUGH AN ENVIRONMENTAL DATA MANAGEMENT SYSTEM
C. S. Chamberlain and P. L. Cederwall Feb. 1993 7 p Presented at the HAZMACON 1993: Hazardous Materials Conference, San Jose, CA, 6-8 Apr. 1993
(Contract W-7405-eng-48)
(DE93-040487; UCRL-JC-111732; CONF-9304206-1) Avail: CASI HC A02/MF A01

Efficient data management is crucial to environmental investigations. The management system must provide for organized data tracking, storage, and retrieval of data essential to successful environmental management. Ultimately, the system is used as an environmental management tool for remediation decisionmaking. This paper will describe the structure and flow of data in the data management system used by the Environmental Restoration Division of the Environmental Protection Department of Lawrence Livermore National Laboratory (LLNL). The structure is based on three relational databases that are closely correlated. The first database handles sample tracking. The second database handles nondiscrete data, such as sample location, media, analytical results, and some geological information. These two databases are maintained on a VAX 63 10 with VMS, using INGRES relational database software. The third database handles nondiscrete data like graphic imaging flies and geophysical logs and will be run on an IPC Sparc, using INGRES. The flow of data, both hard copy and electronic, follows a model that tracks information from sampling plan through decisionmaking. The steps in the process include chain-of-custody (CoC) tracking of the sample, receipt of analytical results, application of quality control procedures, and electronic use of data in decision support tools, such as graphic imaging, model development and verification, or statistical analysis. QUALITY DATA VALIDATION: COMPREHENSIVE APPROACH TO ENVIRONMENTAL DATA VALIDATION
L. A. Matejka, Jr. 1993 15 p Presented at the 20th American Society for Quality Control (ASQC) National Energy and Environmental Annual Conference, Indian Wells, CA, 19-22 Sep. 1993
(Contract DE-AC07-84ID-12435)
(DE94-000925; WINCO-11968; CONF-9309139-9) Avail: CASI HC A03/MF A01

Environmental data validation consists of an assessment of three major areas: analytical method validation; field procedures and documentation review; and evaluation of the level of achievement of data quality objectives based in part on PARCC parameters analysis and expected applications of data. A program utilizing matrix association of required levels of validation effort and analytical levels versus applications of this environmental data was developed in conjunction with DOE-ID guidance documents to implement actions under the Federal Facilities Agreement and Consent Order in effect at the Idaho National Engineering Laboratory. This was an effort to bring consistent quality to the INEL-wide Environmental Restoration Program and database in an efficient and cost-effective manner. This program, documenting all phases of the review process, is described here. DOE

FLEXIBLE FRAMEWORK FOR CONTINGENT INFORMATION SYSTEMS MODELLING
V. VanSwede and J. C. VanVliet Dec. 1992 32 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-220549; IR-310) Avail: CASI HC A03

The modelling of complex information systems requires that a large number of issues be dealt with. Most well-known development methods concentrate on a subset of these issues. The authors have developed a rich framework that aims to cover a much larger number of issues than is currently addressed. The framework can be used as a check list in composing project scenarios. The present article presents the framework and its rationale, and illustrates its use in classifying modelling techniques and extending existing development methods. NTIS

BIBLIOGRAPHIC RETRIEVAL SYSTEM (BARS), SANDIA SHOCK COMPRESSION (SSC) DATABASE, SHOCK PHYSICS INDEX (SPHINX) DATABASE, VOLUME 2: UNIX VERSION USER'S GUIDE
G. M. vonLaven (Advanced Software Engineering, Madison, AL.) and W. Herrmann Sep. 1993 65 p
(Contract DE-AC04-94AL-85000)
(DE94-001704; SAND-93-1422-Vol-2) Avail: CASI HC A04/MF A01

The Bibliographic Retrieval System (BARS) is a database management system specially designed to store and retrieve bibliographic references and track documents. The system uses INGRES to manage this database and user interface. It uses forms for journal articles, books, conference proceedings, theses, technical reports, letters, memos, visual aids, as well as miscellaneous forms which can be used for data sets or any other material which can be assigned an access or file number. Sorted output resulting from flexible BOOLEAN searches can be printed or saved in files which can be inserted in reference lists for use with word processors. DOE

SPECIFICATIONS OF ETS, THE ENHANCED TRANSPORT SERVICE
Cristophe Diot, Patrick Cocquet (Dassalt Electronique, Saint Cloud, France.), and Didier Stunault (Dassalt Electronique, Saint Cloud, France.) 5 May 1992 66 p
(RR-907-I; ETN-93-94996) Avail: CASI HC A04/MF A01

Enhanced Transport Services (ETS) provided to the session layer at the boundary between session and transport layers of the OSI (Open Systems Interconnection) reference model is defined. ETS is structured as a service kernel backward compatible with ISO (International Standards Organization) 8072 service. Around this service kernel, optional service subsets will be added, depending on the application requirements: real time data transfer, voice and video transfer, etc. These specific service subsets will increase ETS flexibility and enlarge its range of applications. Synchronization, management, and automatic connection are examples of specific services required by the previous applications. The service kernel only is defined. Every time it is possible, this document adopts the ISO concepts and terminology. It has a structure which is similar to that of ISO

8072 in order to facilitate the comparison between the two documents.

A SYSTEM FOR MANAGING INFORMATION AT ATLAS
I. R. Tilbrook 1993 12 p Presented at the 1993 Symposium of North-Eastern Accelerator Personnel (SNEAP), Rochester, NY, 22-25 Sep. 1993
(Contract W-31-109-eng-38)
(DE94-001337; ANL/PHY/CP-80830; CONF-9309262-1) Avail: CASI HC A03/MF A01

In response to a need for better management of maintenance and document information at the Argonne Tandem-Linear Accelerating System (ATLAS), the ATLAS Information Management System (AIMS) has been created. The system is based on the relational database model. The system's applications use the Alpha-4 relational database management system, a commercially available software package. The system's function and design are described.

SPACE STATION FREEDOM (SSF) DATA MANAGEMENT SYSTEM (DMS) PERFORMANCE MODEL DATA BASE
John R. Stovall Nov. 1993 128 p
(Contract NAS9-17900)
(NASA-CR-188270; NAS 1.26:188270; LESC-30966) Avail: CASI HC A07/MF A02

The purpose of this document was originally to be a working document summarizing Space Station Freedom (SSF) Data Management System (DMS) hardware and software design, configuration, performance and estimated loading data from a myriad of source documents such that the parameters provided could be used to build a dynamic performance model of the DMS. The document is published at this time as a close-out of the DMS performance modeling effort resulting from the Clinton Administration mandated Space Station Redesign. The DMS as documented in this report is no longer a part of the redesigned Space Station. The performance modeling effort was a joint undertaking between the National Aeronautics and Space Administration (NASA) Johnson Space Center (JSC) Flight Data Systems Division (FDSD) and the NASA Ames Research Center (ARC) Spacecraft Data Systems Research Branch. The scope of this document is limited to the DMS core network through the Man Tended Configuration (MTC) as it existed prior to the 1993 Clinton Administration mandated Space Station Redesign. Data is provided for the Standard Data Processors (SDP's), Multiplexer/Demultiplexers (MDM's) and Mass Storage Units (MSU's). Planned future releases would have added the additional hardware and software descriptions needed to describe the complete DMS. Performance and loading data through the Permanent Manned Configuration (PMC) was to have been included as it became available. No future releases of this document are presently planned pending completion of the present Space Station Redesign activities and task reassessment.

CONCEPTS AND TECHNIQUES FOR AN ACTIVE DATABASE APPROACH TO OFFICE PROCEDURE SUPPORT
P. W. P. J. Grefen 1993 28 p
(PB94-110749; Memo-Inf-93-25) Copyright Avail: CASI HC A03/MF A01

Administrative processes in office environments often consist of complex procedures specifying tasks to be executed and dependencies between them. Office automation systems support these office procedures by providing powerful and flexible transaction processing facilities. The report proposes a technique for office procedure support called 'automatic transaction invocation'. This technique makes use of standard active database concepts for the specification and implementation of complex office procedures. The technique provides separate high-level specification of transactions describing the elementary office tasks, and dependency rules between transactions describing the overall structure of the office procedure application, including detailed timing requirements. The concepts of the technique can easily be mapped onto a graph-based representation, allowing an attractive means for design and analysis of complex applications.

SPACE OPERATIONS: ARCHIVING SPACE SCIENCE DATA NEEDS FURTHER MANAGEMENT IMPROVEMENTS. REPORT TO THE CHAIRMAN, SUBCOMMITTEE ON INVESTIGATIONS AND OVERSIGHT, COMMITTEE ON SCIENCE, SPACE, AND TECHNOLOGY, HOUSE OF REPRESENTATIVES

Dec. 1993 25 p
(GAO/NSIAD-94-25; B-254957) Avail: CASI HC A03/MF A01; GAO, PO Box 6015, Gaithersburg, MD 20884-6015 HC

The National Aeronautics and Space Administration (NASA) creates long-term archives of scientific data from its space missions because of the potential importance of the data in future studies such as long-term analyses of the earth's environment. This report responds to the former Chairman's request that we review changes to NASA'S data archiving program since we last reported on the program in 1990. Our reports criticized the conditions of NASA'S data archives and pointed out that the archives were incomplete for many important missions and held no data for others. In summary, it is recommended that NASA improve the physical condition of its archives, obtain and restore all appropriate data from past missions, and revise its data management policies to ensure that all valuable data are adequately archived in the future. Our objectives were to determine if NASA had improved its data archiving policies and practices in response to our recommendations and whether there are other opportunities to improve that program. AstroMail: ELECTRONIC MAIL FOR THE ASTROPHYSICS COMMUNITY Final Report

Phillip H. Scherrer and Richard S. Bogart 20 May 1993 13 p
(Contract NAS5-30428; RTOP 506-59-11)
(NASA-CR-194877; NAS 1.26:194877) Avail: CASI HC A03/MF A01

As part of the NASA Science Internet User Support Services program, NASA Goddard was interested in R&D which could extend the SolarMail system developed by members of the Wilcox Space Observatory at Stanford University to support a larger astrophysics user community. Specific objectives of the R&D effort were to include: a clone of the existing SolarMail system with additional documentation, enabling a parallel mail system to be established by populating the database; a cloned version of SolarMail functioning with a user database similar to that of the High Energy Astrophysics Division (HEAD) of the American Astronomical Society; a report on the status and surveyed usage of SolarMail and its clones into an extendable distributed mail system to serve as the basis for AstroMail, including a draft declaration of policy; a prototype AstroMail system based on the above specifications and including at least SolarMail and one of its clones supporting a set of astronomy user databases as subsets; and a report on the status of the prototype AstroMail with recommendations for future modifications to AstroMail. NASA HIGH PERFORMANCE COMPUTING AND COMMUNICATIONS PROGRAM Annual Report, 1992

Lee Holcomb, Paul Smith, and Paul Hunter Dec. 1993 141 p
(NASA-TM-4554; NAS 1.15:4554) Avail: CASI HC A07/MF A02

The National Aeronautics and Space Administration's HPCC program is part of a new Presidential initiative aimed at producing a 1000-fold increase in supercomputing speed and a 100-fold improvement in available communications capability by 1997. As more advanced technologies are developed under the HPCC program, they will be used to solve NASA's 'Grand Challenge' problems, which include improving the design and simulation of advanced aerospace vehicles, allowing people at remote locations to communicate more effectively and share information, increasing scientist's abilities to model the Earth's climate and forecast global environmental trends, and improving the development of advanced spacecraft. NASA's HPCC program is organized into three projects which are unique to the agency's mission: the Computational Aerosciences (CAS) project, the Earth and Space Sciences (ESS) project, and the Remote Exploration and Experimentation (REE) project. An additional project, the Basic Research and Human Resources (BRHR) project exists to promote long term research in computer science and engineering and to increase the pool of trained personnel in a variety of scientific disciplines. This document presents an overview of the objectives and organization of these projects as well as summaries of individual research and development programs within each project. Author (revised)

FACT-BASED ENTERPRISE INFORMATION MANAGEMENT USING NIAM

G. Rivord 1993 13 p Presented at the 1993 Conference on Natural Language Information Analysis Methodology and Information System Design Methodology, Utrecht, Netherlands, 15-17 Sep. 1993
(Contract DE-AC04-76DP-00789)
(DE93-041135; SAND-93-1211C; CONF-9309238-2) Avail: CASI HC A03/MF A01

The effort to consolidate the 'islands of information' within an enterprise -- to manage information at the enterprise level rather than the department or sub-system level -- is known by many names, such as 'Information Resource Management' and 'Corporate Data Administration'. Here we will call it 'Enterprise Information Management' (EIM). This effort is becoming increasingly vital as the need for shared information grows, yet it is plagued by costly, time-consuming efforts that produce reams of hard-to-maintain documentation. The results are difficult to integrate, measure, or apply. Management needs a tool that can integrate models from diverse modeling efforts into a global knowledge base, produce metrics to clarify the value of the integration process, and provide a short, traceable route between information models and their physical implementations. The natural-language emphasis of NIAM makes it an ideal candidate for this tool. When integrated with enterprise-wide data administration, the collection of metrics, CASE tools that produce application code, and automated support tools, NIAM can effectively manage multiple Universes of Discourse (UOD). Prototypes of automated support tools, 'Fact Manager' and 'Fact Designer', will be discussed. DOE

INCREASING LEVELS OF ASSISTANCE IN REFINEMENT OF KNOWLEDGE-BASED RETRIEVAL SYSTEMS

Catherine Baudin (National Aeronautics and Space Administration. Ames Research Center, Moffett Field, CA.), Smadar Kedar (Northwestern Univ., Evanston, IL.), and Barney Pell (National Aeronautics and Space Administration. Ames Research Center, Moffett Field, CA.) Feb. 1994 18 p
(Contract NAS2-13721)
(NASA-CR-195144; NAS 1.26:195144; RIACS-TR-94-03) Avail: CASI HC A03/MF A01

The task of incrementally acquiring and refining the knowledge and algorithms of a knowledge-based system in order to improve its performance over time is discussed. In particular, the design of DE-KART, a tool whose goal is to provide increasing levels of assistance in acquiring and refining indexing and retrieval knowledge for a knowledge-based retrieval system, is presented. DE-KART starts with knowledge that was entered manually, and increases its level of assistance in acquiring and refining that knowledge, both in terms of the increased level of automation in interacting with users, and in terms of the increased generality of the knowledge. DE-KART is at the intersection of machine learning and knowledge acquisition: it is a first step towards a system which moves along a continuum from interactive knowledge acquisition to increasingly automated machine learning as it acquires more knowledge and experience. WASTE MINIMIZATION/POLLUTION PREVENTION AT R/D FACILITIES: A CRADLE-TO-GRAVE TRACKING AND INFORMATION SYSTEM THAT WILL BE IMPLEMENTED AT SANDIA NATIONAL LABORATORIES

M. W. Hollingsworth (Rinchem Co., Inc., Albuquerque, NM.), E. A. Kjeldgaard, and R. Navarrete (Bell Telephone Labs., Inc., Murray Hill, NJ.) 1993 6 p Presented at the Environmentally Conscious Manufacturing Congress 1993, Arlington, VA, 30 Aug. - 1 Sep. 1993 Limited Reproducibility: More

than 20% of this document may be affected by microfiche quality
(Contract DE-AC04-76DP-00789)
(DE93-040330; SAND-93-2031C; CONF-9308150-4) Avail: CASI HC A02

A comprehensive environment, safety, and health (ES&H) program allocates an extensive portion of its resources to information collection, management, and manipulation. Much of these resources are difficult to obtain and even more costly to ensure that they are sufficiently accurate; however, a system which collects information at the point which a process begins or a material enters a facility and maintains that information throughout its entire life-cycle is a more efficient approach to providing the data necessary to meet ES&H requirements. These data requirements for all the various groups within an ES&H program are associated with the properties and interactions among materials, personnel, facilities, hazards, waste, and processes. Although each group is charged with addressing a particular aspect of these properties and interactions, the information they require can be aggregated into a coherent set of common data fields. It is these common data fields that the Cradle-to-Grave Tracking and Information System (CGTIS) is designed to satisfy. Research and development laboratories such as Sandia National Laboratories (SNL) are diverse in nature and, therefore, present a complex challenge to ES&H professionals. The remainder of this paper will describe the CGTIS as envisioned and implemented at SNL, define the requirements of a complete CGTIS, and review the current status of each system module at SNL. DOE

WORLD PROCESSOR: AN INTERFACE FOR TEXTUAL DISPLAY AND MANIPULATION IN VIRTUAL REALITY

Jouke Verlinden, Jay David Bolter, and C. vanderMast 1993 12 p
(PB94-118643; Rept-93-55) Copyright Avail: CASI HC A03/MF A01

We propose a Virtual Reality interface for creating and manipulating textual and hypertextual information. Many current hypertext systems include concept maps in two dimensions. Our system, called the World Processor, offers the user a three-dimensional concept map. It allows the user to move through the map while exploring existing objects and their associated texts and adding new objects and texts. We discuss a number of interface issues raised by three-dimensional hypertext and then describe the World Processor as an attempt to address some of these issues. Of particular interest in the World Processor interface are its point-and-shoot selection technique, its methods for reading and editing text in 3D, its widgets for creating and modifying conceptual objects, and its auditory as well as visual feedback. Possible applications for three-dimensional hypertext include CSCW (particularly collaborative writing) and authoring systems for computer-based training. NTIS

RITL: AN INFORMATION SYSTEM FOR APPLICATION REUSE-IN-THE-LARGE Ph.D. Thesis

HaiKuan Li 1993 243 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-119088; ISBN-90-6275-871-1) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

This dissertation provides system developers with a set of methods for application reuse, particularly for application reuse-in-the-large. The idea of reuse-in-the-large, in contrast with that of traditional reuse (the reuse of small code components), aims at reusing large-grain components of information systems and, more importantly, the information about the creation of the components. Such kind of reuse reflects the requirements for developing large and complex applications. The methods for application reuse-in-the-large, as provided in this dissertation, include a method for reusing abstract data types and algorithm structures, a method for reusing system architectures and design templates, and a method for modeling, specification, management and manipulation of large-scale components. These methods are applied in an information system for application development and maintenance with reuse-in-the-large. NTIS

MODELING OF DATABASE CONSTRAINTS IN ACTIVE DATABASES Final Report, Jun. 1992 - Jun. 1993

S. B. Navathe and A. K. Tanaka Oct. 1993 59 p
(Contract F30602-92-C-0092)
(AD-A273484; RL-TR-93-189) Avail: CASI HC A04/MF A01

This report deals with the problems of specification, modeling, and enforcement of constraints in databases. The active database area is emerging as a viable alternative for implementation of large scale database applications, particularly those involving data that needs close monitoring and control due to its dynamic nature. Applications in monitoring of personnel, equipment materials, etc., need capabilities available in modern database systems. The entire area of command and control engineering is likely to benefit immensely from the emerging active database technology. This report presents an enhanced conceptual data model which is based on the popular entity relationship (ER) data model. This model has been enhanced with a capability of modeling active database behavior at a higher level than the event condition-action rules used in other systems. A high level specification language is presenting and then showing how it can be mapped into the facilities of an active commercial DBMS such as INGRES. This report addresses three different types of constraints: integrity constraints, the invariant properties of the model as constraints, and dynamic constraints that deal with a change of state that occurs during update operations. The facility described can be thought of as a part of the design tools that are needed to exploit the active capabilities in a database management system. DTIC

CORRECT AND EFFICIENT INTERFACE FOR LOGICAL QUERY LANGUAGES WITH COMPLEX OBJECTS
M. Holsheimer, R. A. deBy, and H. Aiet-Kaci 1993 16 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB93-211175; Memo-INF-93-02) Copyright Avail: Issuing Activity (National Technical Information Service (NTIS))

The authors describe a formal design for a logical query language using psi-terms as data structures to interact effectively and efficiently with a relational database. The structure of psi-terms provides an adequate representation for so-called complex objects. They generalize conventional terms used in logic programming: they are typed attributed structures, ordered thanks to a subtype ordering. Unification of psi-terms is an effective means for integrating multiple inheritance and partial information into a deduction process. They define a compact database representation for psi-terms, representing part of the subtyping relation in the database as well. They describe a retrieval algorithm based on an abstract interpretation of the psi-term unification process and prove its formal correctness. The algorithm is efficient in that it incrementally retrieves only additional facts that are actually needed by a query, and never retrieves the same fact twice. NTIS

THIRD ANNUAL FOREIGN ACQUISITIONS WORKSHOP: IMPROVING ACCESS TO FOREIGN GRAY LITERATURE
1993 214 p Workshop held in Crystal City, VA, 21-23 Sep. 1993
(NASA-TM-109683; NAS 1.15:109683) Avail: CASI HC A10/MF A03

The theme of the Third Annual Foreign Acquisitions Workshop was the acquisition of and access to foreign (non-U.S.) gray literature. Individual presentations addressed general topics related to the value and scope of gray literature, specialized and foreign gray-literature sources, intellectual property issues, and U.S. Federal Agency activities. Additional topics focused on electronic access and evaluation techniques and the current and potential uses of networking technology. The workshop papers are presented in their entirety or in abstract or outline form. Appendices include a listing of databases that include foreign gray literature, a bibliography, and a report on U.S.-Japan cooperation in the use of scientific and technical information. CASI

INFORMATION TECHNOLOGY IN THE SERVICE SOCIETY: A TWENTY-FIRST CENTURY LEVER
1994 281 p
(ISBN-0-309-04876-1; LC-92-85596) Copyright Avail: Issuing Activity

The use of information technology (IT), including computer and communications hardware as well as the software and associated services required to effectively use that hardware, has revolutionized the structure of management and the nature of competition in a variety of industries. IT is especially important in the service sector. Contrary to the widespread misconception of services as predominantly simple, labor-intensive and technically sophisticated firms in transportation, financial services, banking, insurance, retail and wholesale trade, telecommunications, health care, and professional and personal services. As IT becomes less expensive, more portable, better integrated and interconnected, and embedded in a wider variety of devices, new applications in these fields and whole new industries are likely to evolve and to have profound effects on industry structures, employment, and economic growth. The effectiveness with which IT is deployed in services strongly influences U.S. standards of living and competitiveness in world trade. This book includes chapters on the impact of IT at the macroeconomic level, the industry level, the enterprise level, and the activity level. Also included are chapters on improving decision making about IT, and IT in services: implications for public policy. Derived from text

A USAGE PROFILE AND EVALUATION OF A WIDE-AREA DISTRIBUTED FILE SYSTEM
Mirjana Spasojevic and M. Satyanarayanan Oct. 1993 18 p
(Contract MDA972-90-C-0036)
(AD-A273590) Avail: CASI HC A03/MF A01

The evolution of the Andrew File System (AFS) into a wide-area distributed file system has encouraged collaboration and information dissemination on a much broader scale than ever before. In this paper, we examine AFS as a provider of wide-area file services to over 80 organizations around the world. We discuss usage characteristic of AFS derived from empirical measurements of the system and from user responses to a questionnaire. Our observations indicate that AFS provides robust and efficient data access in its current configuration, thus confirming its viability as a design point for wide-area distributed file systems. HORATIO: LIBRARIES FOR VISION APPLICATIONS, RELEASE 2.0
Philip F. McLauchlan 15 Dec. 1992 77 p
(OUEL-1967/92; ETN-94-95153) Avail: CASI HC A05/MF A01

The Holistic Real Time Architecture for Transputer Image Operations (Horatio) is described. The Horatio vision system comprises a set of libraries written in ANSI C for either Sun workstations or transputers. The global library contains definitions and functions needed by most applications. There is also a maths library, a pipeline control library, a list manipulation library and an image library providing for manipulation and channel/stream/file input/output of two dimensional images. A graphics library allows images and other primitives to be displayed in an arbitary number of X-windows canvases. An image processing library contains source for image processing tools. The process library allows the creation of process pipelines and the tool library high level X-windows tools for creation of Horatio applications. Only the graphics and tool libraries are X-specific. FACTORS INFLUENCING PERCEIVED USABILITY AND UTILITY OF LIBERTAS AT CRANFIELD: IMPLICATIONS FOR SYSTEM MODIFICATION AND USER EDUCATION

Peter Brooks Oct. 1992 53 p
(Cranfield-Aero-9212; ISBN-1-87-156450-6; ETN-94-95219) Avail: CASI HC A04/MF A01

A survey of user opinions towards and experience of Cranfield's Libertas library automation system was conducted in order to determine user attitudes towards the system, user characteristics which predict these attitudes, and the key areas for improvement in service provision. The survey included student and staff users of the academic library and the in-library and remote access of Libertas. The study identified that in general user perceptions of the utility and usability of the system are positive but indicate the need for improvements in system design and user education. It was found possible to predict more positive user attitudes on the basis of regularity and frequency of general system use and the use of the inter-library loan facility and certain catalog searching facilities. User characteristics such as demographic details and previous education and experience were not found to be associated with user attitudes toward the system. Six service change areas were identified from user opinion on recommended improvements and were concerned with additional functionality, system prompts, paper based information support, training, Boolean searching, and networking. Recommendations for service improvements in each of these areas are provided. ESA

A COMPARISON OF BOOLEAN-BASED RETRIEVAL TO THE WAIS SYSTEM FOR RETRIEVAL OF AERONAUTICAL INFORMATION Final Report

Gary Marchionini and Diane Barlow Washington Mar. 1994 77 p Prepared for RMS Associates, Linthicum Heights, MD
(Contract NASw-4584)
(NASA-CR-4569; NAS 1.26:4569) Avail: CASI HC A05/MF A01

An evaluation of an information retrieval system using a Boolean-based retrieval engine and inverted file architecture and WAIS, which uses a vector-based engine, was conducted. Four research questions in aeronautical engineering were used to retrieve sets of citations from the NASA Aerospace Database which was mounted on a WAIS server and available through Dialog File 108 which served as the Boolean-based system (BBS). High recall and high precision searches were done in the BBS and terse and verbose queries were used in the WAIS condition. Precision values for the WAIS searches were consistently above the precision values for high recall BBS searches and consistently below the precision values for high precision BBS searches. Terse WAIS queries gave somewhat better precision performance than verbose WAIS queries. In every case, a small number of relevant documents retrieved by one system were not retrieved by the other, indicating the incomplete nature of the results from either retrieval system. Relevant documents in the WAIS searches were found to be randomly distributed in the retrieved sets rather than distributed by ranks. Advantages and limitations of both types of systems are discussed. Author

ENGINEERING FOR PROFITABILITY
Frank Turner 1992 11 p Presented at Sir Alfred Herbert Lecture, Institution of Electrical Engineers, London, United Kingdom, 18 Feb. 1992 Limited Reproducibility: More than 20% of this document may be affected by poor print
(PNR-90990; MISC-2693; ETN-93-93709) Copyright Avail: Issuing Activity (European Space Agency (ESA))

Engineering, and the ways it can be more focused on profitability and therefore on Britain's prosperity, are discussed. Profit is described as the financial gain which can only be achieved by reducing costs. The two major choices on how to achieve higher profit involve product differentiation and lower costs. The three major areas of product differentiation that could contribute to the profitability of a product are discussed: technical superiority, product integrity, and short time to market (i.e. available first). Areas in which lower costs can be addressed are also discussed: engineering plus manufacture, internal and external manufacture, and sales and support. Additionally, business education in engineering is discussed. ESA

SIMPLICIAL VARIABLE DIMENSION RESTART ALGORITHM TO FIND ECONOMIC EQUILIBRIA ON THE UNIT SIMPLEX USING n(n+1) RAYS
R. A. M. G. Joosten and A. J. J. Talman (Limburg State Univ., Maastricht, Netherlands.) 8 Jun. 1993 32 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-110541; FEW-608) Avail: Issuing Activity (National Technical Information Service (NTIS))

A new simplicial variable dimension restart algorithm is introduced to solve the zero point or equilibrium problem on the n-dimensional unit simplex S(sup n). The number of one-dimensional sets or rays along which the algorithm can leave the arbitrarily chosen starting point is n(n + 1). In case the algorithm is applied to find a general equilibrium price vector in an exchange economy with n + 1 commodities, it generates a piecewise linear path of prices, connecting the arbitrarily chosen starting price vector with an approximate equilibrium price vector. At an equilibrium price vector the excess demand of all commodities is zero. Along the path the price of a commodity is kept equal to the initial price if the excess demand of that commodity is neither minimal nor maximal. If the excess demand of a commodity becomes maximal, the price of that commodity is increased from its initial value, and if the excess demand becomes minimal, the price is decreased from its initial value. Also a new intersection theorem on S(sup n) is derived. NTIS

SPACE TECHNOLOGY: A STUDY OF THE SIGNIFICANCE OF RECOGNITION FOR INNOVATORS OF SPINOFF TECHNOLOGIES. 1993 ACTIVITIES/1994, 1995 PLANS Annual Report
Jan. 1994 31 p
(Grant NAGw-3322)
(NASA-CR-194836; NAS 1.26:194836) Avail: CASI HC A03/MF A01

During the past 30 years as NASA has conducted technology transfer programs, it has gained considerable experience - particularly pertaining to the processes. However, three areas have not had much scrutiny: the examination of the contributions of the individuals who have developed successful spinoffs, the commercial success of the spinoffs themselves, and the degree to which they are understood by the public. In short, there has been limited evaluation to measure the success of technology transfer efforts mandated by Congress. Research conducted during the first year of a three-year NASA grant to the United States Space Foundation has taken the initial steps toward measuring the success of methodologies to accomplish that Congressionally-mandated technology transfer. In particular, the US Space Foundation, in cooperation with ARAC, technology transfer experts; JKA, a nationally recognized themed entertainment design company; and top evaluation consultants, inaugurated and evaluated a fresh approach including commercial practices to encourage, motivate, and energize technology transfer by: recognizing already successful efforts (Space Technology Hall of Fame Award), drawing potential business and industrial players into the process (Space Commerce Expo), and informing and motivating the general public (Space Technology Hall of Fame public venues). The first year's efforts are documented and directions for the future are outlined. Author (revised)

SPACE TECHNOLOGY: A STUDY OF THE SIGNIFICANCE OF RECOGNITION FOR INNOVATORS OF SPINOFF TECHNOLOGIES. COMMERCIAL SPACE EXPO-USA, 1993 Report, 1993
Aug. 1993 35 p
(Grant NAGw-3322)
(NASA-CR-194833; NAS 1.26:194833) Avail: CASI HC A03/MF A01

This is a report on the data collected at the Commercial Space Expo. The Expo was held 13-14 April 1993, in conjunction with the National Space Symposium. There were two modes of data gathering: surveys of expo registrants and exhibit feedback. In addition, exhibitors were interviewed to get their perspectives on the format of the expo and exhibits. Expo registrants were given a paper-pencil survey instrument at the beginning of the day and were asked to turn in the survey when they left for the day. Of the approximately 100 registrants, 22 surveys were returned. In the exhibit hall were five computers set up to collect people's reactions to specific exhibits. It was envisioned that people would react to each (or several) exhibits they visited. In fact, few people did this: almost everyone who visited a computer responded to one exhibit and did not stop by another computer. Therefore, we did not get a large number of responses for any particular exhibit. Nevertheless, there are some interesting data. Author (revised)

NASA TECHNOLOGY APPLICATIONS TEAM: APPLICATIONS OF AEROSPACE TECHNOLOGY Annual Report, Oct. 1992 - Sep. 1993
Sep. 1993 156 p
(Contract NASw-4367)
(NASA-CR-194775; NAS 1.26:194775; RTI/4321/Q4-93) Avail: CASI HC A08/MF A02

This report covers the activities of the Research Triangle Institute (RTI) Technology Applications Team for the period 1 October 1992 through 30 September 1993. The work reported herein was supported by the National Aeronautics and Space Administration (NASA), Contract No. NASW-4367. Highlights of the RTI Applications Team activities over the past year are presented in Section 1.0. The Team's progress in fulfilling the requirements of the contract is summarized in Section 2.0. In addition to our market-driven approach to applications project development, RTI has placed increased effort on activities to commercialize technologies developed at NASA Centers. These Technology Commercialization efforts are summarized in Section 3.0. New problem statements prepared by the Team in the reporting period are presented in Section 4.0. The Team's transfer activities for ongoing projects with the NASA Centers are presented in Section 5.0. Section 6.0 summarizes the status of four add-on tasks. Travel for the reporting period is described in Section 7.0. The RTI Team staff and consultants and their project responsibilities are listed in Appendix A. Appendix B includes Technology Opportunity Announcements and Spinoff! Sheets prepared by the Team while Appendix C contains a series of technology transfer articles prepared by the Team. SPACE TECHNOLOGY: A STUDY OF THE SIGNIFICANCE OF RECOGNITION FOR INNOVATORS OF SPINOFF TECHNOLOGIES. A CASE STUDY ON THE IMPACT OF THE SPACE TECHNOLOGY HALL OF FAME AWARD Research Report
Dec. 1993 24 p
(Grant NAGw-3322)
(NASA-CR-194835; NAS 1.26:194835) Avail: CASI HC A03/MF A01

This report represents the preliminary effort in studying the significance of recognition for innovators of spinoff technologies. The purpose of this initial year's effort in this area was to gather preliminary data and define the direction for the remainder of the research. This report focuses on the most recent recipients of the Hall of Fame Award, the developers of liquid-cooled garments. Liquid-cooled garments technology and its spinoffs were used as a case study to define and explore the factors involved in technology transfer and to consider the possible incentives in developing commercial applications including the Hall of Fame Award. Through interviews, views of award recipients were obtained on factors encouraging spinoffs as well as impediments to spinoffs. The researchers observed complex inter-relationships among the significant entities (government, individuals, large and small business), the importance of people, the importance of resource availability, and the significance of intrinsic motivation; drew preliminary conclusions pertaining to the direct and indirect influence of recognition like the Hall of Fame Award; and planned the direction for next year's follow-on research. NASA TECH BRIEF EVALUATIONS
Gary L. Workman Feb. 1994 23 p
(Contract NCC8-18)
(NASA-CR-195150; NAS 1.26:195150; CAR-94-06) Avail: CASI HC A03/MF A01

A major step in transferring technology is to disseminate information about new developments to the appropriate sector(s). A useful vehicle for transferring technology from the government sector to industry has been demonstrated with the use of periodical and journal announcements to highlight technological achievements which may meet the needs of industries other than the one who developed the innovation. To meet this end, NASA has very successfully pursued the goal of identifying technical innovations through the national circulation publication; NASA Tech Briefs. At one time the Technology Utilization Offices of the various centers coordinated the selection of appropriate technologies through a common channel. In recent years, each NASA field center has undertaken the task of evaluating submittals for Tech Brief publication independently of the others. The University of Alabama in Huntsville was selected to assist MSFC in evaluating technology developed under the various programs managed by the NASA center for publication in the NASA Tech Briefs journal. The primary motivation for the NASA Tech Briefs publication is to bring to the attention of industry the various NASA technologies which, in general, have been developed for a specific aerospace requirement, but has application in other areas. Since there are a number of applications outside of NASA that can benefit from innovative concepts developed within the MSPC programs, the ability to transfer technology to other sectors is very high. In most cases, the innovator(s) are not always knowledgeable about other industries which might potentially benefit from their innovation. The evaluation process can therefore contribute to the list of potential users through a knowledgeable evaluator. Author (revised)

This publication is intended to foster the aim of the NASA Technology Transfer Program by heightening awareness of the NASA technology available for reapplication and its potential for public benefit. The publication is organized in three main sections. Section 1 outlines NASA's mainline effort, the major programs that generate new technology and therefore replenish and expand the bank of knowledge available for transfer. Section 2 contains a representative sampling of spinoff products that resulted from secondary application of technology originally developed to meet mainline goals. Section 3 describes the various mechanisms NASA employs to stimulate technology transfer and lists, in an appendix, contact sources for further information about the Technology Transfer Program. GAS-GRAIN SIMULATION EXPERIMENT MODULE CONCEPTUAL DESIGN AND GAS-GRAIN SIMULATION FACILITY BREADBOARD DEVELOPMENT
James M. Zamel, Michael Petach, Nahum Gat, Jack Kropp, Christina Luong, and Michael Wolff Dec. 1993 131 p
(Contract NAS2-13408)
(NASA-CR-177632; A-94034; NAS 1.26:177632) Avail: CASI HC A07/MF A02

This report delineates the Option portion of the Phase A Gas-Grain Simulation Facility study. The conceptual design of a Gas-Grain Simulation Experiment Module (GGSEM) for Space Shuttle Middeck is discussed. In addition, a laboratory breadboard was developed during this study to develop a key function for the GGSEM and the GGSF, specifically, a solid particle cloud generating device. The breadboard design and test results are discussed and recommendations for further studies are included. The GGSEM is intended to fly on board a low earth orbit (LEO), manned platform. It will be used to perform a subset of the experiments planned for the GGSF for Space Station Freedom, as it can partially accommodate a number of the science experiments. The outcome of the experiments performed will provide an increased understanding of the operational requirements for the GGSF. The GGSEM will also act as a platform to accomplish technology development and proof-of-principle experiments for GGSF hardware, and to verify concepts and designs of hardware for GGSF. The GGSEM will allow assembled subsystems to be tested to verify facility level operation. The technology development that can be accommodated by the GGSEM includes: GGSF sample generation techniques, GGSF on-line diagnostics techniques, sample collection techniques, performance of various types of sensors for environmental monitoring, and some off-line diagnostics. Advantages and disadvantages of several LEO platforms available for GGSEM applications are identified and discussed. Several of the anticipated GGSF experiments require the deagglomeration and dispensing of dry solid particles into an experiment chamber. During the GGSF Phase A study, various techniques and devices available for the solid particle aerosol generator were reviewed. As a result of this review, solid particle deagglomeration and dispensing were identified as key undeveloped technologies in the GGSF design. A laboratory breadboard version of a solid particle generation system was developed and characterization tests performed. The breadboard hardware emulates the functions of the GGSF solid particle cloud generator in a ground laboratory environment, but with some modifications, can be used on other platforms. Author

ORBITAL DEBRIS AND NEAR-EARTH ENVIRONMENTAL MANAGEMENT: A CHRONOLOGY
David S. F. Portree and Joseph P. Loftus, Jr. Dec. 1993 114 p
Sponsored by NASA. Washington
(NASA-RP-1320; S-747; NAS 1.61:1320) Avail: CASI HC A06/MF A02

This chronology covers the 32-year history of orbital debris and near-Earth environmental concerns. It tracks near-Earth environmental hazard creation, research, observation, experimentation, management, mitigation, protection, and policy-making, with emphasis on the orbital debris problem. Included are the Project West Ford experiments; Soviet ASAT tests and U.S. Delta upper stage explosions; the Ariane V16 explosion, U.N. treaties pertinent to near-Earth environmental problems, the PARCS tests; space nuclear power issues, the SPS/orbital debris link; Space Shuttle and space station orbital debris issues; the Solwind ASAT test; milestones in theory and modeling the Cosmos 954, Salyut 7, and Skylab reentries; the orbital debris/meteoroid research link; detection system development; orbital debris shielding development; popular culture and orbital debris; Solar Max results; LDEF results; orbital debris issues peculiar to geosynchronous orbit, including reboost policies and the stable plane; seminal papers, reports, and studies; the increasing effects of space activities on astronomy; and growing international awareness of the near-Earth environment. DEMONSTRATION OF THE FEASIBILITY OF AN INTEGRATED X RAY LABORATORY FOR PLANETARY EXPLORATION
E. D. Franco, J. A. Kerner, L. N. Koppel, and M. J. Boyle Dec. 1993 30 p
(Contract NAS2-13416)
(NASA-CR-177631; A-94033; NAS 1.26:177631) Avail: CASI HC A03/MF A01

The identification of minerals and elemental compositions is an important component in the geological and exobiological exploration of the solar system. X ray diffraction and fluorescence are common techniques for obtaining these data. The feasibility of combining these analytical techniques in an integrated x ray laboratory compatible with the volume, mass, and power constraints imposed by many planetary missions was demonstrated. Breadboard level hardware was developed to cover the range of diffraction lines produced by minerals, clays, and amorphous; and to detect the x ray fluorescence emissions of elements from carbon through uranium. These breadboard modules were fabricated and used to demonstrate the ability to detect elements and minerals. Additional effort is required to establish the detection limits of the breadboard modules and to integrate diffraction and fluorescence techniques into a single unit. It was concluded that this integrated x ray laboratory capability will be a valuable tool in the geological and exobiological exploration of the solar system. Author (revised)

VOYAGER OBSERVATIONS OF GLOBULAR CLUSTERS Final Report
5 Jan. 1994 8 p
(NASA Order S-97230-E)
(NASA-CR-194806; NAS 1.26:194806) Avail: CASI HC A02/MF A01

The objectives of this task are to direct and analyze the observations of globular clusters targets observed with the ultraviolet spectrometer on the Voyager spacecraft. The data analysis will be directed toward understanding the Voyager spectra or upper limits in terms of the expected properties of the hot stars in the globular clusters. One out of the four proposed targets was observed before the Voyager guest observer program was cancelled in early 1993. The observed target, NGC 6397, showed a spectrum characteristic of hot stars. However, further analysis showed that most of this emission was unlikely to be due to the hot post asymptotic giant branch cluster member ROB 162, and was probably due to dust-scattered light from unrelated foreground stars. Three types of analysis were performed to test the origin of the Voyager spectrum. First, the flux variations during the limit-cycle motion of the spacecraft motion were binned as a function of time; these showed no evidence of a point source response. Second, the Voyager spectrum were compared with an IUE spectrum of ROB 162; this showed that the Voyager flux was three times larger than

could be explained from this star alone. Finally, a Voyager background observation taken 26 arcminutes from the cluster center was analyzed; this showed that the observed spectrum intensity did not diminish as the Voyager aperture was moved away from the globular cluster center.

UV SPECTRAL VARIABILITY IN THE HERBIG Ae STAR HR 5999. 11: THE ACCRETION INTERPRETATION
M. R. Perez, C. A. Grady (Applied Research Corp., Landover, MD.), and P. S. The (Astronomical Inst., Amsterdam, Netherlands.) 2 Mar. 1993 11 p Submitted for publication
(Contracts NAS5-32059; NAS5-31841)
(NASA-CR-189313; NAS 1.26:189313) Avail: CASI HC A03/MF A01

We report recent IUE high- and low-dispersion observations with the IUE long wavelength camera (LWP) and short wavelength camera (SWP) of the Herbig Ae star HR 5999. We have found a dramatic change in the structure of the Mg II h and k lines (2795.5, 2802.7 A) along with some continuum flux excesses especially at the short end of the SWP camera. LWP high dispersion observations of HR 5999 obtained between 1979 and 1990, at times of comparatively low UV continuum fluxes, exhibit P Cygni type m profiles in the Mg II resonance doublet. In contrast, observations made from September 1990 through March 16-18, 1992, with high W continuum fluxes, present Mg II lines with reverse P Cygni profiles indicative of some active episodic accretion. Accreting gas can also be detected in the additional red wings of the various Fe II and Mn II absorption lines, with velocities up to +300-350 km/s (September 1990). By September 10, 1992 the Mg II profile had returned to the type III P Cygni profile similar to those from earlier spectra. The correlation between the presence of large column densities of accreting gas and the continuum light variations supports suggestions by several authors that HR 5999 is surrounded by an optically thick, viscously heated accretion disk. Detection of accreting gas in the line of sight to HR 5999 permits us to place constraints on our viewing geometry for this system. A discussion is included comparing the spectral and physical similarities between HR 5999 and the more evolved proto-planetary candidate system, beta Pictoris. Author (revised)

100 GHz MAP OF 3C 446
M. S. Lerner (Onsala Space Observatory, Sweden.), L. B. Baath (Onsala Space Observatory, Sweden.), M. Inoue (Nobeyema Solar Radio Observatory, Japan.), S. Padin (Owens Valley Radio Observatory, Pasadena, CA.), A. E. E. Rogers (Northeast Radio Observatory Corp., Westford, Mass. Haystack Observatory.), M. C. H. Wright (California Univ., Berkeley.), A. Zensus (National Radio Astronomy Observatory, Socorro, NM.), D. C. Backer (California Univ., Berkeley.), R. S. Booth (Onsala Space Observatory, Sweden.), and J. E. Carlstrom (Owens Valley Radio Observatory, Pasadena, CA.) et al 1993 7 p Prepared in cooperation with Northeast Radio Observatory Corp., Westford, MA; Haystack Observatory, National Radio Astronomy Observatory, Socorro, NM; California Univ., Berkeley, and Owens Valley Radio Observatory, Pasadena, CA
(PB94-104882; REPT-93/67) Avail: CASI HC A02/MF A01

The first map made from 100 GHz VLBI observations of the quasar/BL Lac object 3C446 is presented. This map represents a 25-fold increase in resolution compared to earlier maps. The main conclusions are that the core of 3C446 is still almost unresolved at this frequency and that a jet extends several hundred microarcseconds at position angle about -142 deg. A comparison is also made with observations at other size scales.

MODEL ATMOSPHERE ANALYSIS OF SELECTED LUMINOUS B STARS Final Report, 1 Oct. 1991 - 30 Sep. 1993
Edward L. Fitzpatrick, Massa (Applied Research Associates, Inc., Albuquerque, NM.), and Walgren (Computer Sciences Corp., El Segundo, CA.) 8 Feb. 1994 2 p
(Grant NAG5-1769)
(NASA-CR-195098; NAS 1.26:195098) Avail: CASI HC A01/MF A01

The general scientific goal of this program has been to determine whether the atmospheric structure of the B-type stars can be represented by the current generation of plane parallel, line-blanketed, LTE stellar atmosphere models sufficiently well to allow accurate effective temperatures and surface gravities to be deduced. The B stars cover a wide range of temperature and luminosity. For the hottest such stars (with T approximately 30,000 K) the applicability of the models may be compromised by departures from LTE in the stellar atmospheres ('non-LTE effects'). At the highest luminosities (the B 'super giants'), the models may be invalidated by departures from plane parallel geometry. Thus we seek to identify the temperature and luminosity range within which these effects are unimportant and where the models may be relied upon. Derived from text

THE 1404+286: A NON-IDEAL CALIBRATOR FOR VLBI OBSERVATIONS
F. J. Zhang, L. B. Baath, and R. E. Spencer (Nuffield Radio Astronomy Labs., Jodrell Bank, England.) Aug. 1993 7 p Submitted for publication Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-104908; Rept-93/71) Avail: CASI HC A02

The radio source 1404+286 was observed with global VLBI arrays at 5 and 1.67 GHz in 1990.88 and 1991.45, respectively. High quality maps are presented in this paper, and show the source to be resolved at both frequencies with a core-jet like structure extending about 6 mas in position angle about -145 deg. The jet direction is similar in both maps. 1404+286 has often been used in the past as a flux density calibrator or a phase referencing source. The results show that this source is not an ideal calibrator on VLBI scales. NTIS

INFRARED AND SiO MASER OBSERVATIONS OF OH/IR STARS
L. A. Nyman (European Southern Observatory, La Silla, Chile.), P. J. Hall (Anglo-Australian Observatory, Epping.), and T. LaBertre (Observatoire de Paris-Meudon, France.) 1993 24 p Submitted for publication Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-104890; Rept-93/70) Avail: CASI HC A03

The authors have performed quasisimultaneous infrared photometry and observations of the SiO 86 GHz (v=1, J=2-1) and SiO 43 GHz (v=1 and 2, J=1-0) maser emission from a sample of 44 OH/IR stars. In contrast to masers associated with Mira variables, the SiO 86 GHz integrated flux densities in OH/IR stars are weaker than those at 43 GHz, and the SiO 43 GHz (v=2) emission is often stronger than the SiO 43 GHz (v=1) emission. Results show that it is useful to divide the sample into two groups because of the difference in their SiO maser properties: sources with warm, thin envelopes (K - L less than 4), and sources with cooler, thicker envelopes (K - L greater than 4). In the warmer sources, the average 43 GHz/86 GHz integrated flux density ratio is of order 2, but in the cooler sources it is significantly larger, more than 10. NTIS

[SO2 ON VENUS: A FINAL CROSS-CALIBRATION WITH PIONEER VENUS] Final Report
1 Mar. 1994 18 p
(Grant NAG5-1913; SwRI Proj. 15-5301)
(NASA-CR-195162; NAS 1.26:195162) Avail: CASI HC A03/MF A01

The three observing programs under NASA Grant NAG5-1913 are described. They are NSOSS, VEOEB, and PCOEB. The scientific objectives for the IUE observation program NSOSS were to: make the first ever UV observations of a near-earth asteroid (4179 Toutatis), an irregular satellite of Jupiter (Himalia), and the Saturnian satellite Hyperion; obtain the first radially-dependent information on the UV color of Saturn's rings; gather the uncontaminated UV spectra of Iapetus's bright and dark hemispheres; and obtain a spectrum of Titania to initiate the comparitive study of UV photometric properties in Uranian system. The VEOEB program studied Venus SO2, an important indicator of key processes in the Venus atmosphere and perhaps Venus surface. Based on past Pioneer Venus and IUE observations, significant SO2 variations have been interpreted as indicating that the long term atmospheric SO2 abundance may be related to large, episodic injections from the surface or interior of Venus. The PCOEB program studied the Pluto-Charon system, for which evidence of a variable UV light curve has been presented. This program is to complete the coverage of that UV light curve, since only approximately 26% has been observed. Derived from text

SHOCKED CLOUDS IN THE CYGNUS LOOP Final Report, 15 Feb. 1992 - 14 Feb. 1994
John C. Raymond Feb. 1994 4 p
(Grant NAG5-1870)
(NASA-CR-195190; NAS 1.26:195190) Avail: CASI HC A01/MF A01

This grant covers the analysis of ROSAT PSPC and HRI images of the Cygnus Loop, an elderly supernova remnant. The project, as proposed, includes not only the usual analysis of ROSAT data; the ROSAT data is being combined with optical and UV data, and new model calculations are being performed. The status is reported on optical imagery, echelle data, IUE data, ROSAT data, and the grain model. The major question being addressed is whether the blastwave-cloud interaction in the feature known as XA is basically a converging shock in a fairly large cloud or turbulent stripping of material from the edges of a smaller cloud. (NASA-CR-195189; NAS 1.26:195189) Avail: CASI HC A02/MF A01

We have been surveying the Taurus dark cloud for young stars using a variety of techniques. Two optical proper motion surveys identified 8 new pre-main sequence stars; an IRAS-based program discovered 6 new embedded sources and 4-6 new T Tauri stars. Finally, an optical objective prism survey found 12 new T Tauri stars. Our goal in this project is to examine and compare star formation in the dark clouds: Heiles cloud 2 (HCL2), L1537, L1538, and L1544. HCL2 is a very dense region actively forming young stars and contains 5-6 very young, deeply embedded sources; L1537 and L1538 have no known pre-main sequence stars; L1544 contains 7 optically visible T Tauri stars. These clouds appear roughly similar on optical sky survey plates. We would like to know why some of the clouds are active and why some are not. The first goal of the project is to survey the regions using IR photometry to identify very red pre-main sequence stars and X-ray imaging to identify solar-type young stars missed in the near-IR survey. We will follow up these observations with molecular line surveys to compare the conditions in various clouds with their star formation efficiencies. Author (revised)

During this period, much work was spent in an attempt to use theoretical UV line indices as a basis for spectral calibration of the program stars. Five line indices are shown as functions of effective temperature and log g, calculated with the spectral synthesis programs of Kurucz. Open stars and circles are observed values from Fanelli et al., using the spectral class-effective temperature calibration of Schmidt-Kaler. We conclude that these line indices may be used to determine an effective stellar temperature, but with uncertainties of approximately a few thousand degrees. Also, for the hotter stars, theoretical line opacities are systematically low compared to observations. We have also found that Kurucz's new models appear to represent hot stars very well, even at far-UV wavelengths. This is shown in an example where two spectra of mu Col (spectral class 09.5 V) are compared to a synthetic spectrum for T(sub eff) = 33,000 K, log g = 4.0. Also shown (uppermost curve) is an empirical estimate of the intrinsic flux distribution for 09.5 V stars from Papaj, Wegner, and Krelowski. Author (revised)

The Far Infrared Supplement contains a subset of the data in the full Catalog of Infrared Observations (all observations at wavelengths greater than 4.6 microns). The Catalog of Infrared Observations (CIO), NASA RP-1294, is a compilation of infrared astronomical observational data obtained from an extensive literature search of scientific journals and major astronomical catalogs and surveys. The literature search is complete for years 1965 through 1990 in this Third Edition. The Catalog contains about 210,000 observations of roughly 20,000 individual sources and supporting appendices. The expanded Third Edition contains coded IRAS 4-band data for all CIO sources detected by IRAS. The appendices include an atlas of infrared source positions (also included in this volume), two bibliographies of Catalog listings, and an atlas of infrared spectral ranges. The complete CIO database is available to qualified users in printed, microfiche, and magnetic-tape formats. Author (revised)

The status of high energy gamma ray astronomy above 2 x 10(exp 11) eV is reviewed. The main physics motivations for gamma astronomy are summarized. The importance of satellite observations and combined studies is discussed. Usual observation techniques are overviewed. In this energy range earth bound detectors can be used. New large area detectors with an increase in sensitivity became operational. The performance and the preliminary results from the leading experiments are presented. An outlook for the next generation detectors is given. ESA

THE CURRENT STATUS OF OBSERVATIONAL CONSTRAINTS ON COSMIC STRINGS
R. R. Caldwell 1993 7 p Presented at the Gravity and Relativistic Astrophysics, Waterloo, Ontario, 13-15 May 1993
(Contract DE-AC02-76CH-03000)
(DE94-001505; FNAL/C-93/196-A; CONF-9305199-2) Avail: CASI HC A02/MF A01

The observational restrictions on the cosmic string scenario for the formation of large scale structure are evaluated. The restrictions are due to the spectrum of gravitational radiation emitted by oscillating string loops, anisotropies in the cosmic microwave background caused by the strings, and evaporating black holes formed from collapsed cosmic string loops. It is shown that the only free parameter of the scenario, the cosmic string mass-per-unit-length, mu, is severely restricted. DOE

TENSOR-SCALAR COSMOLOGICAL MODELS AND THEIR RELAXATION TOWARD GENERAL RELATIVITY
Thibault Damour and Kenneth Nordtvedt Mar. 1993 34 p See also PB93-162543
(PB93-220796; IHES/P/93/16) Avail: CASI HC A03/MF A01

Cosmological models within general tensor-multi-scalar theories of gravity are studied. By isolating an autonomous evolution equation for the scalar fields, one shows that the expansion of the universe during the matter-dominated era tends to drive the scalar fields toward a minimum of the function alpha(phi) describing their coupling to matter, i.e. toward a state where the tensor-scalar theory becomes indistinguishable from general relativity. The two main parameters determining the efficiency of this natural attractor mechanism toward general relativity are the redshift at the beginning of the matter era (or equivalently the present cosmological matter density) and the curvature of the coupling function alpha(phi). Quantitative estimates for the present level of deviation from general relativity, as measured by the post-Newtonian parameters gamma-1, beta-1 and (G dot)/G, are derived, which give greater significance to future improvements of solar-system gravitational tests. EVOLUTION OF LARGE-SCALE PLASMA STRUCTURES IN COMETS: KINEMATICS AND PHYSICS Final Report
John C. Brandt Oct. 1993 42 p
(Grant NAGw-1387)
(NASA-CR-194777; NAS 1.26:194777) Avail: CASI HC A03/MF A01

Cometary and solar wind data from December 1985 through April 1986 are presented for the purpose of determining the solar wind conditions associated with comet plasma tail disconnection events (DE's). The cometary data are from The International Halley Watch Atlas of Large-Scale Phenomena (Brandt, Niedner, and Rahe, 1992). In addition, we present the kinematic analysis of 4 DE's, those of Dec. 13.5 and 31.2, 1985, and Feb. 21.7 and 28.7, 1986. The circumstances of these DE's clearly illustrate the need to analyze DE's in groups. In situ solar wind measurements from IMP-8, ICE, and PVO were used to construct the variation of solar wind speed, density, and dynamic pressure during this interval. Data from these same spacecraft plus Vega-1 were used to determine the time of 48 current sheet crossings. These data were fitted to heliospheric current sheet curves extrapolated from the corona into the heliosphere in order to determine the best-fit source surface radius for each Carrington rotation. Comparison of the solar wind conditions and 16 DE's in Halley's comet (the four DE's discussed in this paper and 12 DE's in the literature) leaves little doubt that DE's are associated primarily with crossings of the heliospheric current sheet and apparently not with any other property of the solar wind. If we assume that there is a single or primary physical mechanism and that Halley's DE's are representative, efforts at simulation should concentrate on conditions at current sheet crossings. The mechanisms consistent with this result are sunward magnetic reconnection and tailward magnetic reconnection, if tailward reconnection can be triggered by the sector boundary crossing. CORRELATED PETROGRAPHIC, ELECTRON MICROPROBE, AND ION MICROPROBE STUDIES OF SELECTED PRIMITIVE AND PROCESSED PHASE ASSEMBLAGES IN METEORITES Progress Report
Arden L. Albee 1 Sep. 1993 11 p
(Grant NAG9-185)
(NASA-CR-194827; NAS 1.26:194827) Avail: CASI HC A03/MF A01

During the past three years we have received support to continue our research in elucidating the formation and alteration histories of selected meteoritic materials by a combination of petrographic, trace element, and isotopic analyses employing optical and scanning electron microscopes and electron and ion microprobes. The awarded research funds enabled the P.I. to attend the annual LPSC, the co-I to devote approximately 15 percent of his time to the research proposed in the grant, and partial support for a visiting summer post-doctoral fellow to conduct electron microprobe analyses of meteoritic samples in our laboratory. The research funds, along with support from the NASA Education Initiative awarded to P.I. G. Wasserburg, enabled the co-I to continue a mentoring program with inner-city minority youth. The support enabled us to achieve significant results in the five projects that we proposed (in addition to the Education Initiative), namely: studies of the accretional and post-accretional alteration and thermal histories in CV meteorites, characterization of periclase-bearing Fremdlinge in CV meteorites, characterization of Ni-Pt-Ge-Te-rich Fremdlinge in CV meteorites in an attempt to determine the constraints they place on the petrogenetic and thermal histories of their host CAI's, correlated electron and ion microprobe studies of silicate and phosphate inclusions in the Colomera meteorite in an attempt to determine the petrogenesis of the IE iron meteorites, and development of improved instrumental and correction procedures for improved accuracy of analysis of meteoritic materials with the electron microprobe. This grant supported, in part or whole, 18 publications so far by our research team, with at least three more papers anticipated. The list of these publications is included. The details of the research results are briefly summarized. Derived from text

THE SOFT X RAY HALO OF THE SPIRAL GALAXY NGC4631
Rene A. M. Walterbos, Michael F. Steakley, Q. Daniel Wang (Colorado Univ., Boulder.), Colin A. Norman (Johns Hopkins Univ., Baltimore, MD.),

and Robert Braun (Netherlands Foundation for Radio Astronomy, Dwingelo.) 1994 5 p
(Grants NAG5-1924; NSF AST-91-23777)
(NASA-CR-194820; NAS 1.26:194820) Avail: CASI HC A01/MF A01

ROSAT PSPC observations of the close to edge-on spiral galaxy NGC4631 are presented. This vigorously star forming galaxy shows extented x ray emission perpendicular to the plane, out to about 6 to 8 kpc. The spatial extent is largest at soft x ray energies. The total x ray luminosity of hot gas can be easily supplied by star formation in the disk, and it is likely that the halo is due to outflow of hot gas from the inner disk. Spectral analysis of the x ray data shows that part of the halo emission may be quite cool, well below 10(exp 6)K. Implications of these results are briefly discussed. Author (revised)

MOLECULAR ABUNDANCES IN THE ENVELOPES AROUND EVOLVED STARS
H. Olofsson 1993 24 p Submitted for publication Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-104916; Rept-93/75) Avail: Issuing Activity (National Technical Information Service (NTIS))

The circumstellar envelopes (CSE's) of stars on the Asymptotic Giant Branch (AGB) and beyond show a remarkably rich variety of different molecular species. However, only about a third of them have been detected in more than five sources. The relatively simple geometry and kinematics of the CSE's make it possible to use rather uncomplicated methods for estimating molecular abundances that are accurate to within a factor of about five or slightly worse in some cases. The methods have not yet reached the level of sophistication that allows the circumstellar data to be used to obtain detailed information about the elemental composition. However, the results on isotope ratios are already of high quality. It is clear that different molecular species behave differently as the object evolves, and there is good hope that one may eventually be able to use this as a kind of molecular line chronology for stellar evolution on and beyond the AGB. COMPARISON OF TIME INTEGRATION METHODS FOR THE EVOLUTION OF GALAXIES
W. deGraaf 1993 31 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(PB94-111671; W-9316) Avail: Issuing Activity (National Technical Information Service (NTIS))

In the simulation of the evolution of elliptical galaxies, Leap-Frog is currently the most frequently used time integration method. The question is whether other methods perform better than this classical method. Improvements may also be expected from the use of variable step-lengths. We compare Leap-Frog with several other methods, namely: a fourth-order Nystrom method, a symplectic method, and DOPRI-five and eight. DOPRI uses variable steps of its own accord. For the other methods we construct a variable step procedure ourselves. The comparison of the methods is carried out in three Hamiltonian test problems. NTIS

CHROMOSPHERIC ACTIVITY IN AGOL BINARIES Annual Report, 1 Oct. 1992 - 30 Sep. 1993
Mercedes T. Richards 30 Sep. 1993 5 p
(Contract F49620-92-J-0024)
(AD-A273546; AFOSR-93-0858TR) Avail: CASI HC A01/MF A01

The PI continued her study of magnetic activity on the cool components in short-period Algol-type binaries. The rapid rotators typically display enhanced magnetic activity, variations in the brightness of the cool secondary, and changes in the orbital period of the binary which can be linked to changes in the polarity of the magnetic field of the cool star. The PI has compiled observational evidence of magnetic activity in 15 Algol binaries and found that there is a 12 ck of information on the cool stars in these binaries. The systems chosen had orbital periods typically less than 6 days since short-period rapid rotators are more likely to display magnetic activity than their long-period counterparts. The survey showed that although six of the chosen boundaries displayed evidence of variations in the brightness of the secondary, Persei is the only Algol binary for which there was strong evidence of starspot activity. NONEQUILIBRIA IN THERMAL EMISSION FROM SUPERNOVA REMNANTS
Kuniaki Masai (Commissariat a l'Energie Atomique, Gif-sur-Yvette, France.) Dec. 1993 40 p Submitted for publication
(NIFS-264) Avail: CASI HC A03/MF A01

Nonequipartition between the electron and the ion temperatures, and nonequilibrium ionization are discussed in view of thermal X-ray emission from young supernova remnants (SNR's). For electron heating due to Coulomb collisions with ions in the postshock region, an analytical solution is derived for the electron temperature under the adiabatic condition. By Taylor expansion of the solution, we obtain the electron temperature as a function of the electron density, time, and the shock velocity or the shock temperature Ts. With equipartition time tEeq, the solution shows that the electron temperature increases to be approximately 0.1Ts and 0.3Ts in 10(exp -3)tEeq and 10(exp -2)tEeq, respectively. The result is applied to the self-similar solutions for SNR's in the adiabatic phase, i.e., the free expansion phase and the Sedov phase. For SNR's expanding into a uniform density medium, our results predict much slower variation of the electron temperature than the case of full equipartition within the shock. We show the electron temperature plateau on the shocked matter of an SNR, and give analytical expressions of the electron temperature and the resultant free-free luminosity. In the free expansion phase, the electron temperatures of the reverse- and the blast-shocked matter are close to each other in comparison with the case of full equipartition, and their ratio is nearly constant for the ejecta envelope steepness. This results in a larger difference in the free-free luminosities of the two shocks than the case of full equipartition. Ionization processes are discussed in the framework of eigenvalue problem to find the key matrix element which is a pivot of the transformation and gives the characteristic time constant. The ionization time approximately 10(exp 12) n(sub e)(exp -1)s for the electron density n(sub e), and has no systematic dependence either on the electron temperature or the atomic number. The emission from the shocked matter can scale as n(sub e)t, but its superposition on a t-old SNR expanding into a uniform density medium may be represented by a lower value than n(sub e)t expected from the ambient matter density and the age. Also the effect of the nonequilibria on the level populations is discussed in view of line emission processes. While innershell ionization followed by fluorescence lines is important in compression waves, radiative recombination followed by cascade lines is important in rarefaction waves. The rarefaction occurs and adiabatically cools the shocked matter rapidly when the shock wave breaks out of the dense circumstellar matter into the rarefied ambient medium. Author (revised)

X RAY ENHANCEMENT OF SN 1987A DUE TO INTERACTION WITH ITS RING-LIKE NEBULA
Kuniaki Masai (Commissariat a l'Energie Atomique, Gif-sur-Yvette, France.) and Kenichi Nomoto (Tokyo Univ., Japan.) Dec. 1993 29 p
(NIFS-265) Avail: CASI HC A03/MF A01

The progenitor of the supernova 1987A, Sk-69 202 probably had lost a few solar-M in its stellar wind in the past evolutionary track from the red supergiant through the blue supergiant. A part of the mass is thought to form the ring-like nebula surrounding SN 1987A by the interaction with the faster wind in the later blue supergiant stage, and the other must be left outside the ring. In 10-20 yr after the explosion, the expanding ejecta will catch up and collide with the ring. Shocks due to the collision will propagate into and heat up the ejecta, the ring, and the matter outside. The shocked matter will be a thermal X-ray source of temperature of several times 10(exp 7) K, and the X-ray luminosity will reach (0.4-1)x10(exp 37) erg s(exp -1) for the ring of 0.03-0.08 solar-M. The X-ray emission will last for a few decades with luminosity higher than 10(exp 36) erg s(exp -1) depending also on the density outside the ring. We predict the X-ray spectrum as well as the light curve with hydrodynamical calculations taking into account the light travel effect and the opacity of the unshocked ejecta. The epoch of the flare-up depends on the mass inside the ring, and earlier X-ray observations can give a constraint. We give the relations of the mass with the epoch and the pre-flare luminosity in an analytical way based on the self-similar solutions with nonequipartition in the electron and the ion temperatures. Accordingly, the ROSAT observation in 1991 suggests the collision with the ring in 20 yr after the explosion. Author (revised)

ANTARCTIC METEORITE LOCATION AND MAPPING PROJECT (AMLAMP): ANTARCTIC METEORITE LOCATION MAP SERIES EXPLANATORY TEXT AND USER'S GUIDE TO AMLAMP DATA

J. Schutt, B. Fessler, and W. A. Cassidy 1993 186 p
(Contract NASw-4574)
(NASA-CR-194841; NAS 1.26:194841; LPI-TR-93-07) Avail: CASI HC A09/MF A02

This technical report is an update to LPI Technical Report 89-02, which contained data and information that was current to May 1987. Since that time approximately 4000 new meteorites have been collected, mapped, and characterized, mainly from the numerous ice fields in the Allan Hills-David Glacier region, from the Pecora Escarpment and Moulton Escarpment in the Thiel Mountains-Patuxent region, the Wisconsin Range region, and from the Beardmore region. Meteorite location maps for ice fields from these regions have been produced and are available. This report includes explanatory texts for the maps of new areas and provides information on updates of maps of the areas covered in LPI Technical Report 89-02. Sketch maps and description of locales that have been searched and have yielded single or few meteorites are also included. The meteorite listings for all the ice fields have been updated to include any classification changes and new meteorites recovered from ice fields in the Allan Hills-David Glacier region since 1987. The text has been reorganized and minor errors in the original report have been corrected. Computing capabilities have improved immensely since the early days of this project. Current software and hardware allow easy access to data over computer networks. With various commercial software packages, the data can be used many different ways, including database creation, statistics, and mapping. The databases, explanatory texts, and the plotter files used to produce the meteorite location maps are available through a computer network. Information on how to access AMLAMP data, its formats, and ways it can be used are given in the User's Guide to AMLAMP Data section. Meteorite location maps and thematic maps may be ordered from the Lunar and Planetary Institute. Ordering information is given in Appendix A. Derived from text

ULTRAVIOLET, VISIBLE, AND GRAVITY ASTROPHYSICS: A PLAN FOR THE 1990'S

1990 76 p Original contains color illustrations
(NASA-NP-152; NAS 1.83:152) Avail: CASI HC A05/MF A01; 30 functional color pages

NASA's Office of Space Science and Applications (OSSA) receives advice on scientific strategy and priorities from the U.S. National Academy of Sciences. Guidance to the OSSA Astrophysics Division, in particular, is provided by dedicated academy committees, ad hoc study groups, and, at ten-year intervals, by broadly mandated astronomy and astrophysics survey committees charged with making recommendations for the coming decade. Many of the academy's recommendations have important implications for the conduct of ultraviolet and visible-light astronomy from space. Moreover, these areas are now poised for an era of rapid growth. Through technological progress, ultraviolet astronomy has already risen from a novel observational technique four decades ago to the mainstream of astronomical research today. Recent developments in space technology and instrumentation have the potential to generate comparably dramatic strides in observational astronomy within the next ten years. In 1989, the Ultraviolet and Visible Astrophysics Branch of the OSSA Astrophysics Division recognized the need for a new, long-range plan that would implement the academy's recommendations in a way that yielded the most advantageous use of new technology. NASA's Ultraviolet, Visible, and Gravity Astrophysics Management Operations Working Group was asked to develop such a plan for the 1990's. Since the branch holds programmatic responsibility for space research in gravitational physics and relativity, as well as for ultraviolet and visible-light astrophysics, missions in those areas were also included. The working group met throughout 1989 and 1990 to survey current astrophysical problems, assess the potential of new technologies, examine prior academy recommendations, and develop the implementation plan. The present report is the product of those deliberations. Key astrophysical questions to be addressed cover topics such as the structure and evolution of the early universe, energetics of active galactic nuclei, stellar winds in massive stars, sources powered by accretion, composition and state of the interstellar medium, nature of the galactic halo, chromospheric activity in cool stars, and formation of stars and planetary systems. This document provides a review of these questions, program concerns, and the recommended implementation plan for the 1990's. Derived from text

MAGNETIC FIELD DISSIPATION AND CONTRACTION OF MOLECULAR CLOUDS

Takenori Nakano, Ryoichi Nishi, and Toyoharu Umebayashi 1993 11 p
(Rept-337; JTN-94-80523) Avail: CASI HC A03/MF A01

The magnetic flux phi of a cloud or a cloud core is 0.1 to one times the critical flux phi(sub cr) which is proportional to its mass M. The phi/M (or equivalently phi/phi(sub cr)) ratio for a cloud or a cloud core is several hundred to 10(exp 5) times greater than the ratio for magnetic stars with mean surface field of one to 30 kG. The dissipation of magnetic fields in clouds is complicated because they contain various kinds of charged particles (electrons, ions, and grains) whose degree of freezing to field lines vary widely and whose relative abundance changes drastically as the cloud contracts. With a quite general formalism applicable to such wide range of physical situation, the field dissipation in clouds containing ice-mantled grains were investigated, and existence of a decoupling density n(sub dec) with the flux loss time t(sub B) is less than the free-fall time t(sub f) only at the cloud density n(sub H) less than n(sub dec) or t(sub B) approximately equals (10 - 500)t(sub f)(phi(sub cr)/phi) (exp 2) at n(sub H) much less than n(sub dec) at least for phi approximately equal (1 - 0.1) phi(sub cr) was found. The value of n(sub dec) depends rather sensitively on the grain model and the minimum value found is four times 10(exp 9) cu cm including the cases of grains without ice mantles. Author (NASDA)

PROTOPLANETARY DISKS: THEORY AND OBSERVATION BY MILLIMETER AND SUB-MILLIMETER ARRAYS

Takenori Nakano 1993 5 p Sponsored by Ministry of Education, Science and Culture, Tokyo, Japan
(Rept-331; JTN-94-80518) Avail: CASI HC A01/MF A01

Existence of flattened disks around young stellar objects has been suggested by near-infrared and millimeter-wave observations. It is tempting to consider that these disks are related to planet formation and even to formation of a companion star and brown dwarfs. At least in the early stages these must be accretion disks slowly falling onto central stars. Assuming steady accretion with efficient angular momentum transport by magnetic torque, the disk structure was investigated and whether magnetic fields were really coupled well with the gas was checked. It was found that there was a 'decoupling' radius r(sub dec) inside which magnetic fields were decoupled from the gas. The value of r(sub dec) is of the order of 10(exp 2) (central star mass/solar mass) (exp 1/3) AU (Astronomical Unit) or greater depending on the accretion rate and magnetic field strength. The fragmentation which occurs around r(sub dec) and growth of fragments to a companion star and ejection of remaining fragments into galactic space which will finally become brown dwarfs are discussed. The scenario of planet formation developed by the Kyoto group is summarized. Finally such expected structure of protoplanetary disks was shown. Some stages of planet formation may be observed with millimeter and sub-millimeter arrays if approximately 0.1 arcsec resolution is attained. Author (NASDA)

CO-TO-H2 CONVERSION FACTOR IN DWARF IRREGULAR GALAXIES

Koji Ota, Akihiko Tomita, Mamoru Saito, Minoru Sasaki, and Naomasa Nakai 1993 18 p
(Rept-333; JTN-94-80520) Avail: CASI HC A03/MF A01

CO-12 (J = 1 - 0) observations of five nearby dwarf irregular galaxies were made with a beam size of 15 sec., which is comparable to the size of a giant molecular cloud in the galaxies. Star-forming regions and/or H(sub 1) clumps with a column density exceeding 10(exp 21) per sq cm, where molecular clouds tend to be detected, was observed. CO emission was detected toward two H(sub 1) clumps in NGC (New General Catalog of Nebulae and Clusters of Stars) 4214 and one clump in NGC 6822. For another three galaxies (IC (Index Catalog) 1613, Sex (Sextans) A, and GR 8) very low upper limits of the CO luminosity were obtained. The relation between the CO luminosities and the line widths of molecular clouds in twelve galaxies, including other previous observations with a beam size comparable to the size of a giant molecular cloud and/or complex, were examined. The general tendency of this relation is that the CO luminosity for the same line width decreases with decreasing metallicity (O/H) of a galaxy; that is, if the line width is an indicator of the mass of a molecular cloud, the CO-to-H2 conversion factor increases as the metallicity of a galaxy decreases. However, there is a large scatter in the CO luminosity among galaxies with the same metallicity; the conversion factors for dwarf irregular galaxies with the same metallicity are not always the same. The UV. (Ultraviolet) intensity in the star-forming region does not seem to be the main cause for this large scatter. Author (NASDA)

HIGH SPATIAL RESOLUTION OBSERVATIONS OF CO IN CRL 618
Katsunori M. Shibata, Shuji Deguchi, Naomi Hirano, Osamu Kameya, and Shinichi Tamura 1993 25 p Sponsored by Japanese Society for the Promotion of Science, Tokyo, Japan
(Rept-334; JTN-94-80521) Avail: CASI HC A03/MF A01

The aperture synthesis of the very young planetary nebula CRL 618 by CO-12 J = 1 - 0 line and continuum at 115.271 GHz with the Nobeyama Millimeter Array have been observed. The maps with the angular resolution of 3 sec. 6 times 3' sec. 5 show strong concentration of CO toward the ionized core with no clear evidence of a toroidal structure around the star nor along the axis of visible bipolar lobes. Velocity-channel maps show complex structures characterized by a spheroidal component weakly elongated to the east-west direction and a horn-like feature which looks to be spread from the center in a narrow opening angle. It seems difficult to interpret the maps by the simple model with a smooth outflow. The disk structure does not show up in the observation because of the smallness of the disk or obscuring by the surrounding thick spherical CO gas. The red wing component of a high velocity outflow was detected, but not the blue wing component. The red wing arises from the compact region, within 2 sec. from the ionized core, and suggests that the high velocity outflow occurs in a compact region centered on the ionized core. The 115 GHz continuum emission has been detected with the total flux density of 1.48 Jy and it is a point source centered on the ionized core. Author (NASDA)

THE NOBEYAMA MILLIMETER ARRAY SURVEY FOR PROTOPLANETARY DISKS AROUND PROTOSTAR CANDIDATES AND T TAURI STARS IN TAURUS
Nagayoshi Ohashi, Ryohei Kawabe, Masahiko Hayashi, and Masato Ishiguro 1993 11 p Sponsored by Japanese Society for the Promotion of Science, Tokyo, Japan
(Rept-336; JTN-94-80522) Avail: CASI HC A03/MF A01

The Nobeyama Millimeter Array Survey for protoplanetary disks has been made for 19 protostellar IRAS (Infrared Astronomical Satellite) sources in Taurus; 13 of them were optically invisible protostars and six were young T Tauri stars. 8 GHz continuum and CS (J = 2 - 1) line emission were observed simultaneously with spatial resolutions of 2 sec. 8 - 8 sec. 8 (360 AU (Astronomical Unit) - 1,200 AU). The continuum emission was detected from five out of six T Tauri stars and two out of 13 protostar candidates: the emission was not spatially resolved and was consistent with being originated from compact circumustellar disks. Extended CS emission was detected around two T Tauri stars and 11 protostar candidates. There is a remarkable tendency that the detectability for the 8 GHz continuum emission is small for protostar candidates. This tendency is explained if the mass of protoplanetary disks around protostars is not as large as that around T Tauri stars; the disk mass may increase with the increase of central stellar mass by dynamical accretion in the course of evolution from protostars to T Tauri stars. CHOICE OF FILTERS FOR THE DETECTION OF GRAVITATIONAL WAVES FROM COALESCING BINARIES. 2: DETECTION IN COLOURED NOISE
S. V. Dhurandhar (Inter-University Centre for Astronomy and Astrophysics, Pune, India.) and B. S. Sathyaprakash Oct. 1992 33 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616844; IC-92/345) Avail: CASI HC A03 (US Sales Only)

The problem of detecting gravitational wave signals embedded in colored noise from coalescing binary systems is discussed. The signal is assumed to be Newtonian and matched filtering techniques are employed to filter out the signal. The problem is discussed at first for a general power spectral density of the noise and then specific numerical results are obtained for the standard recycling case. Since the signal parameters are unknown, a bank of filters is needed to carry out the signal detection. The number of filters in a bank, the spacing between filters etc. is obtained for different values of the minimum strength of the signal relative to the threshold. An approximate analytical formula which relates the spacing between filters to the minimum strength is also presented. Finally, we discuss the problem of detection probabilities given a data train. A PARALLEL ALGORITHM FOR FILTERING GRAVITATIONAL WAVES FROM COALESCING BINARIES
B. S. Sathyaprakash and S. V. Dhurandhar (Inter-University Centre for Astronomy and Astrophysics, Pune, India.) Oct. 1992 24 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(DE93-616845; IC-92/346) Avail: CASI HC A03 (US Sales Only)

Coalescing binary stars are perhaps the most promising sources for the observation of gravitational waves with laser interferometric gravity wave detectors. The waveform from these sources can be predicted with sufficient accuracy for matched filtering techniques to be applied. A parallel algorithm for detecting signals from coalescing compact binaries by the method of matched filtering is presented. The details of its implementation on a 256-node connection machine consisting of a network of transputers are also reported. The results of our analysis indicate that parallel processing is a promising approach to on-line analysis of data from gravitational wave detectors to filter out coalescing binary signals. The algorithm described is quite general in that the kernel of the algorithm is applicable to any set of matched filters. DOE

(DE93-616849; IC-92/396) Avail: CASI HC A03/MF A01 (US Sales Only)

The propagation of a spatially localized topological object (domain wall or the boundary of the expanding vacuum bubble) in the presence of an extra pseudogoldstone field is investigated. It is shown that, under certain conditions, the propagating domain wall can excite (in its wake) a strictly periodic comoving wave of the pseudogoldstone field. Some possible cosmological consequences of this rather general phenomenon are briefly discussed. DOE

OBSERVATIONAL STUDIES OF THE CLEARING PHASE IN PROTO-PLANETARY DISK SYSTEMS Annual Report, 19 Mar. 1993 - 18 Mar. 1994
Carol A. Grady 9 Mar. 1994 7 p
(Contract NASw-4756)
(NASA-CR-195182; NAS 1.26:195182; R93-217) Avail: CASI HC A02/MF A01

A summary of the work completed during the first year of a 5 year program to observationally study the clearing phase of proto-planetary disks is presented. Analysis of archival and current IUE data, together with supporting optical observations has resulted in the identification of 6 new proto-planetary disk systems associated with Herbig Ae/Be stars, the evolutionary precursors of the beta Pictoris system. These systems exhibit large amplitude light and optical color variations which enable us to identify additional systems which are viewed through their circumstellar disks including a number of classical T Tauri stars. On-going IUE observations of Herbig Ae/Be and T Tauri stars with this orientation have enabled us to detect bipolar emission plausibly associated with disk winds. Preliminary circumstellar extinction studies were completed for one star, UX Ori. Intercomparison of the available sample of edge-on systems, with stars ranging from 1-6 solar masses, suggests that the signatures of accreting gas, disk winds, and bipolar flows and the prominence of a dust-scattered light contribution to the integrated light of the system decreases with decreasing IR excess. The history of Soviet planetary rovers, which were intended for work on the surface of planets and other heavenly bodies, is traced starting with Lunokhod 1, which was designed to survey the Moon. The equipment and methodology of ground tests which simulated lunar conditions--lunar vacuum, gravitation, and soil--are reported. Examples of planetary rovers which followed the Lunokhod program are given. These examples include machines of the following types: wheel walkers; machines that used skiing for locomotion; and two articulated modules. Planet rovers for Venus, Mars, and its satellite Phobos are addressed. The f ocus ison the performance of Marsokhod, the Mars rover. ESA

The history of planetary rovers in the U.S. space program is outlined in the context of the goals, mission and spacecraft designs, and operations designs. The American lunar rover work has had three main stages. In the early sixties, the capacity of Surveyor lunar landers to deliver rovers with a mass of about 50 kg to the Moon was exploited. Several such machines were built and tested beginning in 1964 but none went to the Moon. A manned 400 kg short range rover was then developed. Three of these operated on the Moon in 1971 and 1972 as part of the Apollo 15, 16 and 17 missions. Following these Apollo successes, attempts were made to provide two kinds of follow on models: automated or dual mode (human carrying or not) rovers in the few hundred kg size class, and multi-ton mobile habitats that could carry humans on extended traverses. With the closing of both Soviet and American lunar exploration in the seventies, neither of these proposals succeeded. In parallel with these lunar developments, a lengthy technology program on Martian roving has gone on in the U.S., sometimes coming close to preproject status and sometimes fading away, but never quite being abandoned. As a result it is possible today to contemplate a wide range of lunar and Martian roving missions that could be made practical within a few years. However, with today's funding constraints none of the well studied, larger mission concepts appear to fit. Therefore new efforts are being made toward developing much smaller rovers taking advantage of new miniature techniques, not only in mobility systems but also in the scientific instruments that a small rover can carry. Illustrations are included. ESA

LUNAR SCIENCE STRATEGY: EXPLORING THE MOON WITH HUMANS AND MACHINES
Donald A. Morrison and Stephen J. Hoffman (Science Applications International Corp., Houston, TX.) *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 63-96 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

Important scientific questions that can be addressed from the lunar surface are reviewed for a number of scientific disciplines. A successful strategy for human exploration of the Moon is outlined. It consists of several elements: thorough preparation; a means of extending the human reach; measurement of the mobility of both human and robotic components; and flexible technologies so as to be able to take the most effective path as successive decision points occur. Part of thorough preparation involves concurrent development of a set of science goals and objectives as well as a supporting information base; neither can evolve independently of the other. This matched set will drive the definition of missions and technologies used to satisfy the requirements of various science disciplines. No single site on the Moon will satisfy all requirements. Thus, global accessibility is a goal of the current Lunar and Mars Exploration Program science strategy. Human mobility on the surface is limited to a few kilometers without the use of vehicles. Unpressurized crew carrying rovers could take explorers to distances tens of kilometers from an outpost; the distance is primarily limited by health and safety concerns. Pressurized rovers could extend the range to hundreds of kilometers, but size, mass, and costs limit such vehicles to missions beyond current planning horizons. The establishment of several outposts instead of one would provide opportunities for effective use of the unique capabilities of humans. Extending the human reach to global dimensions may be accomplished through teleoperation or telepresence. The most effective mix of these techniques is a decision that will evolve as experience is gained on the surface. Planning and technology must be flexible enough to allow a variety of options to be selected. ESA

ROVER REQUIREMENTS FOR THE PLANET SURFACE SEGMENT OF THE SPACE EXPLORATION INITIATIVE **c37**
Barney B. Roberts and John F. Connolly *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 97-106 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

Annotated requirements for rovers to be used for the First Lunar Outpost (FLO) of the Space Exploration Initiative (SEI) and for Mars missions are presented. The requirements are presented in the form of functions as opposed to performance. SEI surface systems will be required to execute many roving vehicle functions ranging from transporting humans to recovery and transporting raw materials to a processing plant. Some of the roving vehicles will be highly automated. These automation functions may include the following: teleoperated site survey and certification; teleoperation for repair; autonomous operations for resource location and mining; autonomous navigation and terrain traverse; and telerobotic scientific investigations. These requirements are complex, contradictory, and will be costly if they are not carefully analyzed and properly allocated to conceptual elements. Of greatest importance will be the iterative analysis of requirements and synergistic utilization of vehicle elements. ESA

INTERFEROMETRIC ASTRONOMY ON THE MOON **c89**
Antoine Labeyrie, Jean Jacques Kessis (Paris VII Univ., France.), and Jean Pierre Rambaut (Paris VII Univ., France.) *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 107-114 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

Optical interferometry, the art of achieving the angular resolution of a giant telescope by using many smaller elements, is introduced, and the principles of lunar interferometry are discussed. The proposed Lunar Optical Very Large Airay (LOVLA) is presented. LOVLA consists of telescopes which are mobile on six legs. Each reflects a narrow light beam towards a central station where all the images are superposed. Near the lunar poles, dark craters provide appropriate sites for such instruments. The array may expand to cover 10 km and include as many as 27 telescopes. The LOVLA concept, automated deployment and alignment, mechanical design, metrology and attitude sensors, optical train, and control are discussed. ESA

ROBOTIC EXPLORATION OF MOON AND MARS
Y. Miura *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 115-124 Sponsored by the Japanese Monbusho (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

Results from robotic explorations of the Moon and Mars are summarized. The lunar and Martian soils and rocks can be identified by comparison with the standard data derived from mass spectral patterns of the 'remote sensing Secondary Ion Mass Spectrometry' (remote SIMS). Fine grained glassy materials show more complicated spectral patterns than those of hard crystalline rocks. This type of examination can be applied to analyze amorphous glassy materials and trace element compositions of the lunar and Martian soils and rocks. Experimental results from artificial and terrestrial impact craters suggest that the high density shocked or high pressure-type shocked phases of silica or carbon minerals can coexist with the amorphous glassy phases. Therefore, sophisticated instruments such as the remote SIMS for secondary ions, X-ray analyzers for X-ray diffraction and X-ray absorption coefficient, and polarized microscopy for optical images can be applied to find and collect new shocked crystalline minerals with amorphous phases on the Moon and Mars. ESA

SCIENCE STRATEGY FOR MARS EXPLORATION Abstract Only
Michael H. Carr *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 125-126 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

During the 1990's Mars exploration is expected to change from dominantly orbital reconnaissance to surface reconnaissance. Systematic mapping of the planet by the Mars Observer and Mars-94 orbiters will effectively complete global orbital characterization. Any future orbital observations will likely focus on support of surface missions, both robotic and human. Robotic surface missions have two goals: to improve our scientific understanding of the planet, and to prepare the way for eventual human exploration. The course of Mars exploration in the first decade of the next century will partly depend on which of these two goals dominates. The main goals of Mars science are as follows: to determine the mode of formation of the solid planet and how it evolved to its present state; to determine the climatic history of the planet; and to determine the nature of any indigenous biologic activity, past or present. The science goals are best achieved by a mix of missions including a network, rover missions, and sample return missions, all with global access. Our focus is on the crucial role of rovers in fulfilling both scientific and human exploration goals. ESA

Mars is a favorite site for proposed planetary rover studies; it has the following characteristics: intriguing geology, surface features, and history; and an environment that is not terrbily hostile. For many years, 'Big Rover' was an essential element in the former Soviet space program. During the evolution of the current Soviet Mars project, it seemed attractive to include a rover. The idea was realized in 1990 when a small rover was included as a high risk experiment in the payload of the descent module. The main features of the mission and its science are presented and the limitations are analyzed. The further steps and improvements are foreseen. ESA

PROSPECTS FOR USING MOBILE VEHICLES IN MISSIONS TO MARS AND OTHER PLANETS
V. Kovtunenko, R. Kremnev, G. Rogovsky, and Y. Ivshchenko *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 149-160 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

Automatic stations will play the main role in the Russian program of planetary research. Among these, the outstanding place is occupied by vehicles intended for surface investigations using contact methods. Such investigations may be performed as under stationary conditions and also by use of planetary mobile vehicles. Stationary stations can not provide research of macroevents over spacious terrains and can not gather the statistics necessary for comparative analyses of various geological and climatic zones, etc. All these tasks can be solved by use of planetary mobile vehicles: planetary rovers. The history of Soviet rovers is outlined. Planetary mobile vehicles in the program of Mars investigations are discussed looking into their problems and utilization (global mapping, soil sample gathering and investigation, search for landing site, and regions for investigation). Focus is on the Mars Rover and on a micro-Mars rover. The use of the Mars rover in the Mars sample return mission is considered. Planetary rover development trends (electronics, power support, chassis modifications) are outlined. Diagrams are included. ESA

N94-23385 Sternberg Astronomical Inst., Moscow (USSR).
THE MORPHOLOGY OF THE LUNAR SURFACE PARTS IN THE REGION OF WORK OF THE MOBILE GEOLOGICAL LABORATORY VEHICLE IN MARE IMBRIUM
J. F. Rodionova *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 161-165 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

With the aim of building a manned lunar base at the beginning of the 21st century, the Imbrium basin, favored by its wide diversity of geological formations, was selected to be studied by a field crew of 6 to 8 members. They would travel a total distance of 4000 km and visit 29 separate locations in an attempt to characterize the processes involved in the formation and evolution of a variety of major lunar features. Sites chosen for this expedition are mentioned. Using previous data, the crater density distribution was studied. These results together with profiles and slope angles of several regions on the traverse of the mobile laboratory (constructed on the basis of maps) are presented. Mysterious features near crater Humason are identified and the possibility of them being natural caverns in the form of lava tubes is considered. ESA

LUNAR ROVER NAVIGATION CONCEPTS
James D. Burke (Planetary Society, Pasadena, CA.) *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 167-179 Sponsored by NASA, Washington (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

With regard to the navigation of mobile lunar vehicles on the surface, candidate techniques are reviewed and progress of simulations and experiments made up to now are described. Progress that can be made through precursor investigations on Earth is considered. In the early seventies the problem was examined in a series of relevant tests made in the California desert. Meanwhile, Apollo rovers made short exploratory sorties and robotic Lunokhods traveled over modest distances on the Moon. In these early missions some of the required methods were demonstrated. The navigation problem for a lunar traverse can be viewed in three parts: to determine the starting point with enough accuracy to enable the desired mission; to determine the event sequence required to reach the site of each traverse objective; and to redetermine actual positions enroute. The navigator's first tool is a map made from overhead imagery. The Moon was almost completely photographed at moderate resolution by spacecraft launched in the sixties, but that data set provides imprecise topographic and selenodetic information. Therefore, more advanced orbital missions are now proposed as part of a resumed lunar exploration program. With the mapping coverage expected from such orbiters, it will be possible to use a combination of visual landmark navigation and external radio and optical references (Earth and Sun) to achieve accurate surface navigation almost everywhere on the near side of the Moon. On the far side and in permanently dark polar areas, there are interesting exploration targets where additional techniques will have to be used. ESA

UNMANNED LUNAR ROVERS: UTILIZATION FOR EXPLORATION
J. B. Plescia, A. L. Lane, and D. P. Miller *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 181-192 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

A small lunar rover and its use for lunar exploration are described. Constraints on a rover mission in the fields of communications, power, speed, navigation/hazard avoidance, and operational time are discussed. The rover design concept consistent with the constraints is described. The instruments to be used, again constrained by mass and power requirements, are listed. Three mission objectives are examined: geological exploration; resource assessment; and a geotechnical survey. It was determined that a small rover, with a mass of less than 60 kg and which would be compatible with being carried on the first Artemis lunar lander, could be built and could accomplish significant scientific exploration or the collection of engineering information. ESA

Results of lunar mission studies aimed at developing mission goals and high level requirements are reported. A mission concept to meet the mission requirements was developed and the design of mission hardware was to follow. Mission concepts not only included operations analysis and plans but also fabrication and test planning, quality control measures, and project organization. The design of mission concepts and hardware identified issues that are not easily resolved. Although none of the issues identified appear to be unresolvable, many will be difficult to resolve within Space Exploration Initiative constraints. These issues discussed which appear to have the potential for negative project impact are rover mobility, power, imaging, telemanagment, and remote control. ESA

The Japanese concept of the Lunar Mobile Explorer (LME), a robotic rover which employs second generation space robot technology, is presented. A single launch of H2 rocket will be used to send the rover to the lunar surface. An expendable lander is designed for this mission. After landing at a flat ground near the equator, the LME starts exploring tour toward polar region. It performs precise mapping along the touring course, collection of geological data, analysis of surface and subsurface materials, experimental processing of resources and technology demonstrations. The LME is equipped with an autonomous navigation and steering capability which is mounted by a human operator on the Earth for monitoring and teleoperation. The following are described with regard to the LME: mission requirements; landing point and tour route; vehicle system; system configuration; mass allocation; power constraints; driver guidance; navigation; locomotion mechanism; mission devices; communication; power; and development status. ESA

Mission and system design concepts reflecting the status at about the midpoint of the Marsnet phase A study are reported. The objective of Marsnet is to place three to four small stations (approximately 80 kg) on the surface of Mars to perform scientific measurements in the areas of geophysics (seismology), geology, geochemistry, mineralogy, meteorology, and exobiology. The ESA Landers will constitute part of a global network to which NASA is planning to contribute up to 16 other stations. The Mars Global Network may be seen as a precursor to the exploration of Mars by mobile vehicles in terms of its scientific measurements. But, also, some aspects of mission and system design addressed may be applicable to more complex robotic missions to Mars, for example, the development and testing of feasible probe delivery concepts; the design of low mass, low power components, and solar arrays suited for the Mars environment; and the development of a low complexity mobile instrument deployment device. ESA

MISSION AND SYSTEM DESIGN OF A LONG RANGE ROVER MISSION
Jacques Bernard, Frederic Bonneau, Francois-Xavier Chaffaut, and Jean Ciampi (Centre National d'Etudes Spatiales, Paris, France.) *In its* Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 237-245 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

The definition of the scientific mission of a planetary automatic vehicle on the surface of Mars (fixed stations positioning, profile measurements during traveling, and in situ analysis) identifies constraints on the mission analysis: exploration site location, vehicle mass, volume of data to transmit, duration of mission, interaction with the Earth, orbiter support etc. The mission analysis carried out for three launch opportunities in 1998, 2001 and 2003, for different families of orbits, a priori considered, selects orbits suited to these constraints. The scenarios and strategies of insertion around Mars, orbit positioning and vehicle deorbiting, were evaluated. The mission conditions and dust storms, conjunction, etc., were characterized. The location of vehicles on the surface of Mars (rover and stations) was evaluated, using different kind of measurement involving the spacecraft. The primary results are presented. ESA

A technique for automatic elevation model computation, which uses a binocular camera system and an algorithm termed 'hierarchical feature vector matching' to derive an elevation model (or range map), as well as to compute the interframe correspondences for tracking, is introduced. It is robust in terms of geometric distortions between the stereo partners and relies on hierarchical image representations usable for the realtime demand during descent and landing. It is argued that this algorithm unifies the procedures of range estimation (stereo correspondence, tracking (interframe correspondence), and recognition (input/model correspondence). This technique is demonstrated using a physical model of the Mars surface and a binocular camera system with six geometrical degrees of freedom. This system provides a valuable tool to generate realistic test imagery for the mockup of a spacecraft approaching the landing site. The trajectory of the spacecraft can be predefined and is controlled by a computer interfaced to six motorized positioners. Several experiments that were defined to estimate the accuracy of the computer vision system are reported. ESA

The scientific payload of the Mars rover project includes a large set of the instruments that can provide substantial improvement on the knowledge of Mars. Primary goals are surface studies: morphology, mineralogy, chemistry. Few instruments can investigate subsurface properties. Rovers will be used to study specific objects and to deploy instruments. A television system in pair with an onboard computer is planned for autonomous navigation. Limited command and data transmission through the satellite relay imposes restrictions on control methods. Control combines Earth based long term strategy planning with autonomous onboard short time local decisions. Special algorithms should be developed to control scientific instruments. ESA

The philosophy and details of the first Mars balloon flight mission are presented. The first Mars balloon flight initially scheduled for 1995 has been postponed to 1997. It will be inserted into the atmosphere of Mars from the Mars 96 orbiter. Its scientific program includes a number of experiments. During its flight, measurements of meteo parameters, magnetic field and altitude will be done; television-images with ultrahigh resolution and IR spectrums of the surface are planned. A guiderope, which serves to stabilize the night flight of the balloon near the surface, will be instrumented with subsurface radar and gamma spectrometer. Data from the balloon will be relayed through the Mars 96 orbiter and through Mars Observer. ESA

The main data of the Mars-96 mission and performance of the Mars Rover (MR) which is the mission integral element are reported. The tasks of the Mars-96 mission are as follows: remote sensing from the Mars orbit of the various Mars regions in the different spectral bands; in situ investigations of the Martian atmosphere and surface parameters with the Balloon/Probe (BP) floating in the atmosphere; in situ contact investigations of the Mars surface and atmosphere, Martian soil on different depths, interaction of the atmosphere and soil along the MR route. With regard to the MR, the following are discussed: landing, destination, composition, systems functions, control, communication and program of operation, design, main performance. ESA

A new type of vehicle design named 'rocker-bogie' and later nicknamed 'Rocky', which has a free rocking bogie at the front of a master bogie, is presented. All Rocky design vehicles have the following in common: there are no springs or elastic members other than those used with tires; there is a single rigid body; they have very high ground clearence; all wheels are capable of being steered; the body is differentially connected between the left and right sides on a transverse axis. The basis of the design, a linkage system that distributes the weight among the wheels over a wide range of individual wheel elevations, and how this leads to superior obstacle climbing ability and superior bump performance, are explained. ESA

ROVER: AUTONOMOUS CONCEPTS FOR MARS EXPLORATION c37
A. Baiget, B. Castets, H. Chochon, M. Hayard, H. Lamarre, and A. Lamothe *In its* Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 313-326 Prepared in cooperation with Aerospatiale, Cannes, France; Alcatel Espace, Toulouse, France; Societe Generale de Constructions Electriques et Mecaniques Alsthon, Massy, France; and Societe d'Applications Generales d'Electricite et de Mecanique, Paris, France (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

The development of a mobile, autonomous vehicle that will be launched towards an unknown planet is considered. The rover significant constraints are: Ariane 5 compatibility, Earth/Mars transfer capability, 1000 km autonomous moving in Mars environment, on board localization, and maximum science capability. Two different types of subsystem were considered: classical subsystems (mechanical and mechanisms, thermal, telecommunications, power, onboard data processing) and robotics subsystem, (perception/navigation, autonomous displacement generation, autonomous localization). The needs of each subsystem were studied in terms of energy and data handling capability, in order to choose an on board architecture which best use the available capability, by means of specialized parts. A compromise must always be done between every subsystem in order to obtain the real need with respect to the goal, for example: between perception/navigation and the motion capability. A compromise must also be found between mechanical assembly and calibration need, which is a real problem. ESA

ELECTRICAL POWER TECHNOLOGY FOR ROBOTIC PLANETARY ROVERS c33
C. P. Bankston (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), M. Shirbacheh (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), D. J. Bents, and J. M. Bozek *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 327-336 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

Power technologies which will enable a range of robotic rover vehicle missions by the end of the 1990s and beyond are discussed. The electrical power system is the most critical system for reliability and life, since all other on board functions (mobility, navigation, command and data, communications, and the scientific payload instruments) require electrical power. The following are discussed: power generation, energy storage, power management and distribution, and thermal management. ESA

A study was made on Mars exploration using a powerful Mars rover with a special emphasis on fabricating and testing of some model and of its subsystem. The major objective is set to search for water and organic material in the underground of Mars. An engineering model of a drilling machine to be on board and used for the sample collection in an extensive scientific exploration of Mars surface and underground was fabricated. As a drilling machine, auger boring was adopted. Though it cannot drill hard rocks, it is simple and easy to operate, because it does not require any liquid for lubrication and cooling. It has a capability of 1.5 m boring, requiring 1.15 kW electric power. The auger bit is surrounded with a metal cylindrical casing and the collected soil is stored in the space between the auger bit and the casing. A drilling test was performed using a simulated Mars soil. It has a layered structure, and between each layer, a thin sheet having a different color is inserted. The simulated soil was drilled and collected preserving the layer structure. It was verified that the sample can be collected with a vertical resolution of about 20 cm. The final goal of the drilling capability is set to 10 m drilling. ESA

MECHANICAL DESIGN OF A PLANETARY ROVER c37
F. Littmann, E. Villedieu, and J. M. Idasiak *In* CNES, Missions,

Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 345-359 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

The preliminary mechanical design studies of a planetary rover for the VAP (French acronym for automatic planetary rover) project with a light (100 kg) and a heavy (1000 kg) option are presented. The candidate locomotion concepts are compared and three main locomotion modes are selected: the rolling, walking and peristaltic modes. The peristaltic motion is obtained by sequential motion of parts of a vehicle. The rolling mode is chosen for simplicity and terrestrial experience, the existing planetary rovers based on the rolling mode are compared. An original four wheel drive vehicle with a peristaltic motion and a movable center of gravity is presented. ESA

CONCEPTUAL DESIGN AND ARCHITECTURE OF HEXAPOD ROBOTIC VEHICLES FOR THE (L)OVLA PROJECT c37
Jean-Jacques Kessis, Jean-Pierre Rambaut, and Antoine Labeyrie (College de France, Paris.) *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 369-375 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

The current status of the design of the vehicle part of the Lunar Optical Very Large Array (LOVLA), which is to carry out optical interferometric astronomy on the Moon, is presented. Legs were chosen to deal with the LOVLA's mobility requirements. A frequent argument against legged solutions is the complexity of actuation and control. The problem of controlling the robot exhibits a wide mathematical indetermination. The gait concept, which provides neat and efficient means to reduce indermination, is described. The multilevel control architecture proposed is also described. ESA

WALKING MACHINES FOR SPACE c37
J. Eltze, H.-J. Weidemann, and F. Pfeiffer *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 377-384 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

A study of a new walking machine model differing from existing walking machines both in geometry and control is presented. The main criteria used in the model are not technical principles as used in existing walking machines, but rather biological principles found in insects, the living prototypes of walking machines. The goal of this method is to obtain a harmonic gait which is very robust against disturbances and therefore is suitable to be used on uneven ground found on planets. The geometry, the kinematics and the kinetics of the walking machine model is introduced and the control is explained. Experimental results of this concept tested on a single laboratory leg are shown to prove the robustness of the controller. ESA

ELECTRONIC PAYLOADS FOR MARTIAN MISSIONS: A PRELIMINARY ASSESSMENT OF TECHNOLOGIES
Michel E. Roulet and Jean-Luc Josset *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 395-403 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

A preliminary assessment of design guidelines for electronic payloads that will be used on planetary missions where they will encounter extreme environmental conditions is presented. It shows different aspects related to electronic components on one hand and to mounting and assembly technologies on the other hand, focus is on silicon integrated circuits. Consideration is also given to theoretical semiconductor device physics in order to derive some guidelines for architectural design of analog and digital functional blocks or components. Even if some criticalities can be identified, it is obviously necessary to obtain a practical insight by realizing and testing electronic boards acting as representative test vehicles. The logic to implement this approach is presented and the dedicated cryogenic testing facilities, which are required to have a good test coverage, are described. ESA

CARBON MONOXIDE FUEL CELLS AS A SOURCE FOR MARS ROVER ELECTRIC POWER c33
Mitchell Burnside Clapp *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 405-409 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

Electrochemical fuel cells which can efficiently provide electrical energy from chemical energy are considered. The possible use of carbon monoxide and oxygen obtained from the separation of the carbon dioxide in the Martian atmosphere to make electricity to power planetary rover vehicles on planet Mars is discussed. Although fuel cells are heavier than internal combustion engines of the same power output, they are potentially more reliable and efficient in the consumption of propellant. Depending on the mission model chosen for a planetary rover vehicle, fuel cells using the carbon monoxide and oxygen reaction offer a promising alternative to vehicle designers. ESA

THE MASS OF MASSIVE ROVER SOFTWARE c61
David P. Miller *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 411-414 Prepared in cooperation with Jet Propulsion Lab., California Inst. of Tech., Pasadena (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

A planetary rover, like a spacecraft, must be fully self contained. Once launched, a rover can only receive information from its designers, and if solar powered, power from the Sun. As the distance from Earth increases, and the demands for power on the rover increase, there is a serious tradeoff between communication and computation. Both of these subsystems are very power hungry, and both can be the major driver of the rover's power subsystem, and therefore the minimum mass and size of the rover. This situation and software techniques that can be used to reduce the requirements on both communication and computation, allowing the overall robot mass to be greatly reduced, are discussed. ESA

THE MARS 96 BALLOON GUIDEROPE: AN AUTONOMOUS SYSTEM IN EXTREME ENVIRONMENT CONDITIONS c37
H. Laplace, M. Moreliere, and C. Gorse *In its* Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 417-421 Prepared in cooperation with THARSYS, France (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

The Mars 96 balloon mission involves: an orbiting spacecraft, a descent module, and a balloon to which are attached a gondola with scientific experiments and a stabilizing element named guiderope. An overview of the guiderope mission and characteristics is given. The guiderope's primary mission is to stabilize the Mars balloon during the night, after its descent, in order to avoid the balloon and the gondola contacting the ground. The guiderope has a snake like shape to avoid snagging when dragged on the Martian surface. Its length is 7 m plus a 7 m cable tail. Its mass of 13.5 kg allows the guiderope to house various scientific payloads, management system and its initialization device, a transmitter, its antenna and the batteries. The duration of the mission is ten days after 10 months of transfer from Earth to Mars. ESA

THE REMOTE-OPERATED AUTONOMOUS-ROBOT CONCEPT: FROM DEEP SEA TO OUTER SPACE APPLICATIONS c37
Georges Giralt, Raja Chatila, and Rachid Alami *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 425-441 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

Concepts of a generic architecture aimed to achieve task level teleprogramming and execution control of a remote intervention robot were developed in the framework of several domain oriented projects: deep sea intervention robots, the Advanced Mobile Robots (AMR) (EUREKA) project (public safety), and the Planetary Rover project VAP (French acronym) are developed. In this context, the functional architecture that implements the Remote-Operated Autonomous Robot (ROAR) concept is presented. The framework of the French Mars rover project VAP is used as an illustration of some crucial aspects discussed. ESA

EVOLVING DIRECTIONS IN NASA'S PLANETARY ROVER REQUIREMENTS AND TECHNOLOGY c37
C. R. Weisbin (Jet Propulsion Lab., California Inst. of Tech., Pasadena.), Mel Montemerlo, and W. Whittaker (Carnegie-Mellon Univ., Pittsburgh, PA.) *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 443-454 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

The evolution of NASA's planning for planetary rovers (that is robotic vehicles which may be deployed on planetary bodies for exploration, science analysis, and construction) and some of the technology that was developed to achieve the desired capabilities is reviewed. The program is comprised of a variety of vehicle sizes and types in order to accommodate a range of potential user needs. This includes vehicles whose weight spans a few kilograms to several thousand kilograms; whose locomotion is implemented using wheels, tracks, and legs; and whose payloads vary from microinstruments to large scale assemblies for construction. Robotic vehicles and their associated control systems, developed in the late 1980's as part of a proposed Mars Rover Sample Return (MRSR) mission, are described. Goals suggested at the time for such a MRSR mission included navigating for one to two years across hundreds of kilometers of Martian surface; traversing a diversity of rugged, unknown terrain; collecting and analyzing a variety of samples; and bringing back selected samples to the lander for return to Earth. Current plans (considerably more modest) which have evolved both from technological 'lessons learned' in the previous period, and modified aspirations of NASA missions are presented. Some of the demonstrated capabilities of the developed machines and the technologies which made these capabilities possible are described. ESA

N94-23415 Tokyo Inst. of Tech. (Japan).
DUAL ROVER CONCEPT FOR MARS EXPLORATION c37
Y. Ohkami, K. Matsumoto (National Aerospace Lab., Tokyo, Japan.), and T. Yoshida (Shimizu Corp., Japan.) *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 455-464 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

A concept composed of two identical vehicles connected by cable system is proposed for Mars exploration. Each vehicle is rather conventional with wheels, but the dual vehicle concept provides an outstanding capability, especially when either of them encounters an unexpected difficulty. This is just like a two person party of rock climbing. The leader vehicle can explore an unknown terrain at a risk of falling down or upset. The follower vehicle connected by an extensible cable moves very carefully according to the path exploited by the leader. If the vehicles are augmented by crane capability, it becomes possible to climb rocks whose size exceeds the limitation imposed by vehicle wheel radius, and also to recover from capture in a ditch. A fundamental concept is presented together with operation scenario for mountain climbing and waste land traveling. The key technology includes image processing, maintenance procedures, and hierarchy control under unknown environment. It is demonstrated by simulation that the dual vehicles corporation can do much more and provide increased reliability than the individual capability doubled. ESA

The self propelled undercarriage of the Mars 96 mission Marsokhod, a convertible three section joint structure moving to the wheel walking principle, is considered. Original conical cylindrical wheels provide a unique cross country ability both on loose friable soil and on a surface with critical relief conditions and accidental obstacles. The construction scheme of the self propelled undercarriage and its components and features of arrangement are discussed. Considerations concerning the problems of placing the scientific and service devices and power sources, and requirements for the latter, are indicated. New possibilities discovered for carrying out the scientific experiments are analyzed. Data of laboratory and field on the road tests are given. The main specifications are shown with the self propelled undercarriage and test pieces of the self propelled undercarriage. ESA

MARS 96 ROVER: TECHNICAL VISION AND NAVIGATION Abstract Only c37

V. M. Linkin, V. V. Kerzhanovich, I. Sitenko, and S. Szalai (Hungarian Academy of Sciences, Budapest.) *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 466 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

Two television (TV) systems are planned to be installed on the Mars 96 rover: linear panoramic and frame stereo. The first will permit high resolution 360 field of view image of surrounding landscape. Stereo frames will be written into onboard memory and after computer processing the three dimensional structure of the local surface will be restored. A number of algorithms are under development which should elaborate a safe pass for the rover. TV and TV navigation will also be used to find the objects for study with the instruments and to guide the rover to these objects. Another application of the rover and TV is foreseen: to deploy the instrument on the surface. It can be an antenna for electromagnetic sounding or special modules for seismic measurements. ESA

N94-23418 Academy of Sciences (USSR), Saint Petersburg.

MARSOHKOD MOVEMENT CONTROL Abstract Only c37

P. S. Sologub, S. V. Fedoseev, V. V. Gromov, and G. V. Kozlov *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 467 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

The Marsokhod movement control, which ensures that the Marsokhod comes to a specified region, scientific investigations are carried out in the process of movement and the operation of the scientific devices during the scientific sessions, is discussed. The repertoire of the dataware required of the Marsokhod undercarriage and the tasks of the safety control system are disclosed for this Marsokhod. Possible methods for automatic driving of the undercarriage are discussed, and comparative assessments are produced; requirements are formulated for the computer complex. Practicability of the course indication system is shown in the absence of the magnetic field on Mars. Data are given which were obtained at the laboratory and proving ground tests of the Marsokhod undercarriage. ESA

WALKING, JUMPING, AND TUMBLING: MORE THAN ONE WAY TO GET AROUND MARS Abstract Only c37

R. Brooks *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 469 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

Smaller and novel alternatives to wheels or large legs as a means for moving small scientific packages around the Martian surface are proposed. These proposals include: walking robots on the scale of 2 kg down to a few grams; flea-like robots in the few gram range which make random ballistic motions in order to move around; tumbleweed like robots in the few gram range which rely on being blown around by Martian storms. Each of these approaches brings unique constraints to the types of science that can be done, the type of mission control that can be applied externally, the ways in which data can be communicated, and the options that can be employed for delivery to the surface. These questions are examined for each proposed means of locomotion, the technological bottlenecks are identified, and mission scenarios are examined. ESA

Some of the problems connected to the development of an autonomous command system for a Mars rover functioning in interactive mode are addressed. Results of a selection of the criteria of path optimization are cited; criteria are represented in the form of dimensionless parameters of energy or time expenditure for the movement along the investigated surface. Requirements of the set of onboard information systems are presented; these provide receiving information on time and energy expenditure within the range of sensivity of the onboard information systems. The functional arrangement of the systems for receiving information on surface geometric and mechanical characteristics is described. Various algorithms for information processing, model forming, and selection of optimal rover path, taking into account requirements cited, are considered. ESA

Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

Stereovision algorithms applicable to planetary mobile vehicles are considered. Stereovision systems have an important role to play in planetary exploration from digital elevation modeling of planetary surfaces to navigation of semiautonomous vehicles and control of robotic manipulators. Real time stereovision systems require very high processing power which can only be met by a heterogeneous multiprocessor processing architecture. The current and future processing technologies are examined together with the constraints on space-based electronic systems. The integrated multiprocessor system being developed for digital signal and image processing applications is described. ESA

A DTM-BASED PATH PLANNING METHOD FOR PLANETARY ROVERS c37

R. Morlans and A. Liegeois (Montpellier Univ., France.) *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 499-507 (For primary document see N94-23373 06-91)
Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

Algorithms that automatically find the feasible routes for a mobile robot in a partially known three dimensional environment are proposed. The system is especially devised keeping in mind a planetary rover mission. Starting with a low resolution digital terrain model (DTM), relevant points (saddle points) of the relief are first automatically extracted and a connected network of traversable lines is constructed in a 'structuralist' way: the starting points for the algorithm are the saddle points; the criteria, taking into account the smoothness and the slope of the constructed line, are used to compute the network iteratively. Lines and points of this network are used as arcs and nodes to create a search graph on which an A(star) algorithm is applied to find the optimal route minimizing traveling time or energy while insuring safety. This edge constrained solution serves to initiate shortcut finding laws allowing the vehicle to cross the regions bounded by the lines of the network. The motion across each region is characterized by a cost function computed from the elevation data: mean slope roughness. Examples using a 1000 by 1000 pixel DTM are given. ESA

BOND GRAPH MODELING, SIMULATION, AND REFLEX CONTROL OF THE MARS PLANETARY AUTOMATIC VEHICLE c37

Maher Amara, Jean Pierre Friconneau (Nutech, Saint-Quetin-en-Yvelines, France.), and Alain Micaelli (Commissariat a l'Energie Atomique, Fontenay-aux-Roses, France.) *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 509-529 (For primary document see N94-23373 06-91)

Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

The bond graph modeling, simulation, and reflex control study of the Planetary Automatic Vehicle are considered. A simulator derived from a complete bond graph model of the vehicle is presented. This model includes both knowledge and representation models of the mechanical structure, the floor contact, and the Mars site. The MACSYMEN (French acronym for aided design method of multi-energetic systems) is used and applied to study the input-output power transfers. The reflex control is then considered. Controller architecture and locomotion specificity are described. A numerical stage highlights some interesting results of the robot and the controller capabilities. ESA

MOBILITY ANALYSIS, SIMULATION, AND SCALE MODEL TESTING FOR THE DESIGN OF WHEELED PLANETARY ROVERS c37

Randel A. Lindemann and Howard J. Eisen *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 531-536 Sponsored by NASA, Washington (For primary document see N94-23373 06-91)

Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

The use of computer based techniques to model and simulate wheeled rovers on rough natural terrains is considered. Physical models of a prototype vehicle can be used to test the correlation of the simulations in scaled testing. The computer approaches include a quasi-static planar or two dimensional analysis and design tool based on the traction necessary for the vehicle to have imminent mobility. The computer program modeled a six by six wheel drive vehicle of original kinematic configuration, called the Rocker Bogie. The Rocker Bogie was optimized using the quasi-static software with respect to its articulation parameters prior to fabrication of a prototype. In another approach used, the dynamics of the Rocker Bogie vehicle in 3-D space was modeled on an engineering workstation using commercial software. The model included the complex and nonlinear interaction of the tire and terrain. The results of the investigation yielded numerical and graphical results of the rover traversing rough terrain on the earth, moon, and Mars. In addition, animations of the rover excursions were also generated. A prototype vehicle was then used in a series of testbed and field experiments. Correspondence was then established between the computer models and the physical model. The results indicated the utility of the quasi-static tool for configurational design, as well as the predictive ability of the 3-D simulation to model the dynamic behavior of the vehicle over short traverses. PHYSICAL MODELING AND DYNAMIC SIMULATION OF PLANET VEHICLES: APPLICATION TO THE MOTION PREDICTION c37

Annie Luciani, Stephane Jimenez, and Christian Laugier *In* CNES, Missions, Technologies, and Design of Planetary Mobile Vehicles Jan. 1993 p 537-544 Sponsored in part by CNES and Rhone-Alps Region SHARP Project (For primary document see N94-23373 06-91)

Copyright Avail: Issuing Activity (CEPADUES-Editions, 111, rue Nicolas-Vaquelin, 31100 Toulouse, France)

Physical modeling to predict and control the motions of a planetary rover is considered. The approach presented is not only to incorporate dynamic constraints into geometrical modeling and reasoning, but rather, to design a complete physical model of the entire system: the robot in its physical natural context. Futhermore, with this model, the aim is firstly to evaluate and predict the possible motions of the robot according to its physics, and secondly to assess the feasible plans, according to these motion capabilities. The principles of the physically based modeler simulator Cordis-Anima are introduced. Different physically based models of vehicles, terrains, and terrain-terrain or vehicle-terrain interactions are explained. Given these models, the incorporation of strategical data, provided by a planing stage, into this modeled physical world, is discussed. The two possible directions that have been opened by this approach, the execution model and gestural programming of a planetary vehicle, are pointed out. ESA

A series of experiments that were performed on the Rocky 3 robot is described. Rocky 3 is a small autonomous rover capable of navigating through rough outdoor terrain to a predesignated area, searching that area for soft soil, acquiring a soil sample, and depositing the sample in a container at its home base. The robot is programmed according to a reactive behavior control paradigm using the ALFA programming language. This style of programming produces robust autonomous performance while requiring significantly less computational resources than more traditional mobile robot control systems. The code for Rocky 3 runs on an eight bit processor and uses about ten k of memory. ESA

LUNAR EXPLORATION ROVER PROGRAM DEVELOPMENTS

P. R. Klarer 1993 8 p Presented at the SOAR 1993: Space Operations, Applications, and Research Conference, Houston, TX, 3-5 Aug. 1993

(Contract DE-AC04-76DP-00789)

(DE93-040759; SAND-93-1420C; CONF-9308159-2) Avail: CASI HC A02/MF A01

The Robotic All Terrain Lunar Exploration Rover (RATLER) design concept began at Sandia National Laboratories in late 1991 with a series of small, proof-of-principle, working scale models. The models proved the viability of the concept for high mobility through mechanical simplicity, and eventually received internal funding at Sandia National Laboratories for full scale, proof-of-concept prototype development. Whereas the proof-of-principle models demonstrated the mechanical design's capabilities for mobility, the full scale proof-of-concept design currently under development is intended to support field operations for experiments in telerobotics, autonomous robotic operations, telerobotic field geology, and advanced man-machine interface concepts. The development program's current status is described, including an outline of the program's work over the past year, recent accomplishments, and plans for follow-on development work. DOE

CATALOG OF APOLLO 17 ROCKS. VOLUME 1: STATIONS 2 AND 3 (SOUTH MASSIF)

Graham Ryder Jan. 1993 379 p

(Contract NASw-4574)

(NASA-CR-194854; LPI-CONTRIB-805; NAS 1.26:194854) Avail: CASI HC A17/MF A03

The Catalog of Apollo 17 Rocks is a set of volumes that characterize each of 334 individually numbered rock samples (79 larger than 100 g) in the Apollo 17 collection, showing what each sample is and what is known about it. Unconsolidated regolith samples are not included. The catalog is intended to be used by both researchers requiring sample allocations and a broad audience interested in Apollo 17 rocks. The volumes are arranged geographically, with separate volumes for the South Massif and Light Mantle, the North Massif, and two volumes for the mare plains. Within each volume, the samples are arranged in numerical order, closely corresponding with the sample collection stations. The present volume, for the South Massif and Light Mantle, describes the 55 individual rock fragments collected at Stations two, two-A, three, and LRV-five. Some were chipped from boulders, others collected as individual rocks, some by raking, and a few by picking from the soil in the processing laboratory. Information on sample collection, petrography, chemistry, stable and radiogenic isotopes, rock surface characteristics, physical properties, and curatorial processing is summarized and referenced as far as it is known up to early 1992. The intention has been to be comprehensive: to include all published studies of any kind that provide information on the sample, as well as some unpublished information. References which are primarily bulk interpretations of existing data or mere lists of samples are not generally included. Foreign language journals were not scrutinized, but little data appears to have been published only in such journals. We have attempted to be consistent in format across all of the volumes, and have used a common reference list that appears in all volumes. Where possible, ages based on Sr and Ar isotopes have been recalculated using the 'new' decay constants recommended by Steiger and Jager; however, in many of the reproduced diagrams the ages correspond with the 'old' decay constants. In this volume, mg' or Mg' = atomic Mg/(Mg +Fe). Derived from text

VOYAGER PLANETARY RADIO ASTRONOMY STUDIES Final Report, 1 May 1985 - 30 Jun. 1993
David H. Staelin and Stephen S. Eikenberry 23 Dec. 1993 32 p
(Grant NAG5-537)
(NASA-CR-194776; NAS 1.26:194776) Avail: CASI HC A03/MF A01

Analysis of nonthermal radio emission data obtained by the Planetary Radio Astronomy (PRA) spectrometers on the Voyager 1 and 2 spacecraft was performed. This PRA data provided unique insights into the radio emission characteristics of the outer planets because of PRA's unique spectral response below the terrestrial ionospheric plasma frequency and its unprecedented proximity to the source. Of those results which were documented or published, this final report surveys only the highlights and cites references for more complete discussions. Unpublished results for Uranus, Neptune, and theoretical Ionian current distributions are presented at greater length. The most important conclusion to be drawn from these observations is that banded spectral emission is common to the radio emission below 1-2 MHz observed from all four Jovian planets. In every case multiple spectral features evolve on time scales of seconds to minutes. To the extent these features drift in frequency, they appear never to cross one another. The Neptunian spectral features appear to drift little or not at all, their evolution consisting principally of waxing and waning. Since other evidence strongly suggests that most or all of this radio emission is occurring near the local magnetospheric electron cyclotron frequency, this implies that this emission preferentially occurs at certain continually changing planetary radii. It remains unknown why certain radii might be favored, unless radial electric field components or other means serve to differentiate radially the magnetospheric plasma density, particle energy vectors, or particle coherence. Calculation of the spatial distribution and intensity of the Io-generated magnetospheric currents are also presented; these currents may be limited principally by wave impedance and local field strengths. BASALTIC VOLCANISM AND ANCIENT PLANETARY CRUSTS Final Technical Report, 1 Jun. 1986 - 31 May 1993
John W. Shervais 31 May 1993 123 p
(Grant NAG9-169)
(NASA-CR-193151; NAS 1.26:193151) Avail: CASI HC A06/MF A02

The purpose of this project is to decipher the origin of rocks which form the ancient lunar crust. Our goal is to better understand how the moon evolved chemically and, more generally, the processes involved in the chemical fractionation of terrestrial planetoids. This research has implications for other planetary bodies besides the Moon, especially smaller planetoids which evolved early in the history of the solar system and are now thermally stable. The three main areas focused on in our work (lunar mare basalts, KREEP basalts, and plutonic rocks of the lunar highlands) provide complementary information on the lunar interior and the processes that formed it. For individual titles, see N94-24364 through N94-24373.

HIGHLAND CRUST AT THE APOLLO 14 SITE: A REVIEW
John W. Shervais *In its* Basaltic Volcanism and Ancient Planetary Crusts 31 May 1993 10 p (For primary document see N94-24363 06-91)
Avail: CASI HC A02/MF A02

Recent petrologic studies of pristine nonmare samples from the Apollo 14 site have demonstrated the unique character of the western highlands crust. Many of the lithologies which occur here are not found at other highland sites or represent unique variations of more common lithologies. Rare highland samples found at the Apollo 12 site have petrologic and geochemical affinities with the Apollo 14 highland suite and the two sites taken together constitute what can be called the Western Highland Province. Rocks of the Western Highland Province are geochemically distinct from similar lithologies found at eastern highland sites (Apollo 15, Apollo 16, Apollo 17, and the Luna sites) -- a fact which adds further complications to current petrogenetic models for the lunar crust. Nonetheless, an understanding of how the Western Highlands Province formed and why it differs from highland crust in the east is crucial to our overall understanding of primordial lunar differentiation and petrogenesis. WHOLE ROCK MAJOR ELEMENT CHEMISTRY OF KREEP BASALT CLASTS IN LUNAR BRECCIA 15205: IMPLICATIONS FOR THE PETROGENESIS OF VOLCANIC KREEP BASALTS
Scott K. Vetter and John W. Shervais (South Carolina Univ., Columbia.) *In* South Carolina Univ., Basaltic Volcanism and Ancient Planetary Crusts 31 May 1993 4 p (For primary document see N94-24363 06-91)
Avail: CASI HC A01/MF A02

KREEP basalts are a major component of soils and regolith at the Apollo 15 site. Their origin is controversial: both endogenous (volcanic) and exogenous (impact melt) processes have been proposed, but it is now generally agreed that KREEP basalts are volcanic rocks derived from the nearby Apennine Bench formation. Because most pristine KREEP basalts are found only as small clasts in polymict lunar breccias, reliable chemical data are scarce. The primary aim of this study is to characterize the range in chemical composition of pristine KREEP basalt, and to use these data to decipher the petrogenesis of these unique volcanic rocks. MAJOR ELEMENT CHEMISTRY OF APOLLO 14 MARE BASALT CLASTS AND HIGHLAND PLUTONIC CLASTS FROM LUNAR BRECCIA 14321: COMPARISON WITH NEUTRON ACTIVATION RESULTS
John W. Shervais and Scott K. Vetter (Centenary Coll. of Louisiana, Shreveport.) *In its* Basaltic Volcanism and Ancient Planetary Crusts 31 May 1993 2 p (For primary document see N94-24363 06-91)
Avail: CASI HC A01/MF A02

Studies of lithic components in lunar breccias have documented a wide variety of rock types and magma suites which are not found among large, discrete lunar samples. Rock types found exclusively or dominantly as clasts in breccias include KREEP basalts, VHK mare basalts, high-alumina mare basalts, olivine vitrophyres, alkali anorthosites, and magnesian anorthosites and troctolites. These miniature samples are crucial in petrogenetic studies of ancient mare basalts and the highlands crust of the western nearside, both of which have been battered by basin-forming impacts and no longer exist as distinct rock units. AUTO-METASOMATISM OF THE WESTERN LUNAR HIGHLANDS: RESULT OF CLOSED SYSTEM FRACTIONATION AND MOBILIZATION OF A KREEPy TRAPPED LIQUID

John W. Shervais and Scott K. Vetter (Centenary Coll. of Louisiana, Shreveport.) *In its* Basaltic Volcanism and Ancient Planetary Crusts 31 May 1993 4 p (For primary document see N94-24363 06-91)
Avail: CASI HC A01/MF A02

The discovery of REE-rich phosphates (dominantly whitlockite) in pristine, non-mare rocks of the western lunar nearside (Apollo 14, Apollo 12, and most recently, Apollo 17) has created a paradox for lunar petrologists. These phases are found in feldspar-rich cumulates of both the Mg-suite and the Alkali suite, which differ significantly in their mineral chemistries and major element compositions. Despite the differences in host rock compositions, whitlockites in both suites have similar compositions, with LREE concentrations around 21,000 to 37,000 x chondrite. Simple modeling of possible parent magma compositions using the experimental whitlockite/liquid partition coefficients of Dickinson and Hess show that these REE concentrations are too high to form from normal lunar magmas, even those characterized as 'urKREEP.' POLYTOPIC VECTOR ANALYSIS IN IGNEOUS PETROLOGY: APPLICATION TO LUNAR PETROGENESIS

John W. Shervais and R. Ehrlich *In its* Basaltic Volcanism and Ancient Planetary Crusts 31 May 1993 2 p (For primary document see N94-24363 06-91)
Avail: CASI HC A01/MF A02

Lunar samples represent a heterogeneous assemblage of rocks with complex inter-relationships that are difficult to decipher using standard petrogenetic approaches. These inter-relationships reflect several distinct petrogenetic trends as well as thermomechanical mixing of distinct components. Additional complications arise from the unequal quality of chemical analyses and from the fact that many samples (e.g., breccia clasts) are too small to be representative of the system from which they derived. Polytopic vector analysis (PVA) is a multi-variate procedure used as a tool for exploratory data analysis. PVA allows the analyst to classify samples and clarifies relationships among heterogenous samples with complex petrogenetic histories. It differs from orthogonal factor analysis in that it uses non-orthogonal multivariate sample vectors to extract sample endmember compositions. The output from a Q-mode (sample based) factor analysis is the initial step in PVA. The Q-mode analysis, using criteria established by Miesch and Klovan and Miesch, is used to determine the number of endmembers in the data system. The second step involves determination of endmembers and mixing proportions with all output expressed in the same geochemical variable as the input. The composition of endmembers is derived by analysis of the variability of the data set. Endmembers need not be present in the data set, nor is it necessary for their composition to be known a priori. A set of any endmembers defines a 'polytope' or classification figure (triangle for a three component system, tetrahedron for a four component system, a 'five-tope' in four dimensions for five component system, et cetera). LUNAR MARE VOLCANISM: MIXING OF DISTINCT, MANTLE SOURCE REGIONS WITH KREEP-LIKE COMPONENT

John W. Shervais and Scott K. Vetter *In its* Basaltic Volcanism and Ancient Planetary Crusts 31 May 1993 2 p (For primary document see N94-24363 06-91)
Avail: CASI HC A01/MF A02

Mare basalts comprise less than 1% of the lunar crust, but they constitute our primary source of information on the moon's upper mantle. Compositional variations between mare basalt suites reflect variations in the mineralogical and geochemical composition of the lunar mantle which formed during early lunar differentiation (4.5-4.4 AE). Three broad suites of mare basalt are recognized: very low-Ti (VLT) basalts with TiO2 less than 1 wt%, low-Ti basalts with TiO2 = 2-4 wt%, and high-Ti basalts with TiO2 = 10-14 wt%. Important subgroups include the Apollo 12 ilmenite basalts (TiO2 = 5-6 wt%), aluminous low-Ti mare basalts (TiO2 = 2-4 wt%, Al2O3 = 10-14 wt%), and the newly discovered Very High potassium (VHK) aluminous low-Ti basalts, with K2O = 0.4-1.5 wt%. The mare basalt source region has geochemical characteristics complementary to the highlands crust and is generally thought to consist of mafic cumulates from the magma ocean which formed the felsic crust by feldspar flotation. The progressive enrichment of mare basalts in Fe/Mg, alkalis, and incompatible trace elements in the sequence VLT basalt yields low-Ti basalt yields high-Ti basalt is explained by the remelting of mafic cumulates formed at progressively shallower depths in the evolving magma ocean. This model is also consistent with the observed decrease in compatible element concentrations and the progressive increase in negative Eu anomalies. Derived from text

A DYNAMIC MELTING MODEL FOR THE ORIGIN OF APOLLO 15 OLIVINE-NORMATIVE AND QUARTZ-NORMATIVE MARE BASALTS

Scott K. Vetter and John W. Shervais *In its* Basaltic Volcanism and Ancient Planetary Crusts 31 May 1993 2 p (For primary document see N94-24363 06-91)
Avail: CASI HC A01/MF A02

Early studies of mare basalts from the Apollo 15 site established that two distinct groups are represented: the olivine-normative basalts (ONB) and the quartz-normative basalts (QNB). The ONB and QNB suites are distinguished petrographically by their phenocryst assemblages (the ONB's are olivine-phyric, the QNB's are generally pyroxene-phyric) and chemically by their major element compositions: the QNB's are higher in SiO2 and MgO/FeO, and lower in FeO and TiO2 than ONB's with similar MgO contents. Experimental data show that the QNB suite is derived from a more magnesian, olivine-normative parent magma, a conclusion which is supported by the recent discovery of high-SiO2 olivine-normative basalt clasts in breccia 15498. The high-SiO2 ONB's fall on olivine control lines with primitive QNB's, and least-squares mixing calculations are consistent with the high-SiO2 ONB's being parantal to the more evolved QNB suite. These high-SiO2 ONB's are included as part of the 'QNB suite'. Our major element modeling results also are consistent with the conclusions of earlier studies which showed that the ONB and QNB suites cannot be related to one another by low pressure crystal fractionation. The combination of high Mg#, high SiO2, and low TiO2 in the QNB suite precludes a relationship to the ONB suite by simple removal of liquidus minerals (olivine and pigeonite). Despite these significant differences in petrography and major element composition, both groups have nearly identical trace element concentrations and chondrite-normalized abundance patterns. The major question to be addressed by any petrogenetic model for Apollo 15 mare basalts is how to form mare basalt suites with distinctly different major element characteristics but nearly identical trace element compositions. The similarity in trace element concentrations imply compositionally similar source regions and similar percent melting, but these conclusions are not easily reconciled with the observed differences in major element compositions, which require sources with distinct mineralogies or large differences in percent melt. Derived from text

MELT ROCK COMPONENTS IN KREEPy BRECCIA 15205: PETROGRAPHY AND MINERAL CHEMISTRY OF KREEP BASALTS AND QUARTZ-NORMATIVE MARE BASALTS

John W. Shervais and Scott K. Vetter *In its* Basaltic Volcanism and Ancient Planetary Crusts 31 May 1993 2 p (For primary document see N94-24363 06-91)
Avail: CASI HC A01/MF A02

Many current models for the origin of lunar highland rocks feature as an essential component the assimilation of KREEPy material by primitive magmas parental to the Mg-rich suite and alkali suite plutonic rocks. Similar models have also been proposed for the origin of various mare basalt suites. However, any model which considers assimilation of KREEP an important petrologic process must sooner-or-later deal with the question: what is KREEP? Because pristine KREEP basalts are rare, and most known samples are small (e.g., 15382/15386), the geochemical variability of KREEP basalts is poorly known. Other KREEP compositions which are commonly used in these models include the hypothetical 'high-K KREEP' component of Warren and Wasson, which is derived from Apollo 14 soil data, and the 'superKREEP' quartz-monzodiorite 15405. Lunar breccia 15205 is a polymict regolith breccia that consists of approximately 20% KREEP basalt clasts and 20% quartz-normative basalt clasts in a KREEP-rich matrix. Bulk rock mixing calculations show that this sample comprises about 84% KREEP. The clasts range up to 1 cm in size, but most are considerably smaller. The primary aim is to characterize pristine KREEP basalts petrographically, to establish the range in chemical compositions of KREEP basalts, and to test models that were proposed for their origin. In addition, we may be able to extend the compositional range recognized in the quartz-normative basalt suite and cast some light on its origin as well. Preliminary whole rock geochemical data on the KREEP basalts are presented in a companion paper by M.M. Lindstrom and co-workers. Concentration is on petrography and mineral chemistry of these clasts, and the implications these data have for the origin of the different melt rock suites. Derived from text

HETEROGENEITY IN SMALL ALIQUOTS OF APOLLLO 15 OLIVINE-NORMATIVE BASALT: IMPLICATIONS FOR BRECCIA CLAST STUDIES

Marilyn M. Lindstrom, John W. Shervais (South Carolina Univ., Columbia.), and Scott K. Vetter (South Carolina Univ., Columbia.) *In* South Carolina Univ., Basaltic Volcanism and Ancient Planetary Crusts 31 May 1993 2 p (For primary document see N94-24363 06-91)
Avail: CASI HC A01/MF A02

Most of the recent advances in lunar petrology are the direct result of breccia pull-apart studies, which have identified a wide array of new highland and mare basalt rock types that occur only as clasts within the breccias. These rocks show that the lunar crust is far more complex than suspected previously, and that processes such as magma mixing and wall-rock assimilation were important in its petrogenesis. These studies are based on the implicit assumption that the breccia clasts, which range in size from a few mm to several cm across, are representative of the parent rock from which they were derived. In many cases, the aliquot allocated for analysis may be only a few grain diameters across. While this problem is most acute for coarse-grained highland rocks, it can also cause considerable uncertainty in the analysis of mare basalt clasts. Similar problems arise with small aliquots of individual hand samples. Our study of sample heterogeneity in 9 samples of Apollo 15 olivine normative basalt (ONB) which exhibit a range in average grain size from coarse to fine are reported. Seven of these samples have not been analyzed previously, one has been analyzed by INAA only, and one has been analyzed by XRF+INAA. Our goal is to assess the effects of small aliquot size on the bulk chemistry of large mare basalt samples, and to extend this assessment to analyses of small breccia clasts. Derived from text

On June 28-30, 1993, the Workshop on Atmospheric Transport on Mars was held in Corvallis, Oregon. The workshop was organized under the auspices of the MSATT (Mars Surface and Atmosphere Through Time) Program of NASA, and was jointly sponsored by the Lunar and Planetary Institute, Oregon State University, and the Oregon Space Grant Consortium. More than 50 scientists attended the workshop, which was the first such meeting to focus upon circulation processes in the Mars atmosphere. The timing of the workshop placed it almost on the eve of the arrival of Mars Observer at Mars, so that the presented papers gave a picture of the 'state of the art' in Mars atmospheric science just prior to the expected arrival of new data. The workshop highlighted a host of recent advances in atmospheric modeling and analysis - advances that will be relevant to any future observations. For individual titles, see N94-24872 through N94-24904.

THE NASA/GISS MARS GENERAL CIRCULATION MODEL: PRELIMINARY EXPERIMENTS Abstract Only

Michael Allison, M. A. Chandler (University Corp. for Atmospheric Research, Boulder, CO.), A. D. DelGenio, A. Lacis, D. Rind, W. B. Rossow, L. D. Travis, and W. Zhou (Hughes STX, Inc., Greenbelt, MD.) *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 5 (For primary document see N94-24871 06-91)
Avail: CASI HC A01/MF A01

The NASA/GISS Mars General Circulation Model (GCM) is an adapted version of the GISS Global Climate/Middle Atmosphere Model, specifically developed for the diagnostic validation and objective analysis of measured atmospheric temperatures from the Mars Observer Pressure Modulator Infrared Radiometer (PMIRR) experiment. The GISS Mars GCM has 23 vertical layers extending from the surface to approximately 80 km altitude, representing a vertical resolution of about 0.3 scale heights. The primitive (vertically hydrostatic) equations are solved in finite difference form on the Krakawa B grid, with a horizontal resolution of 8 deg x 10 deg (latitude-longitude). The model includes a diurnal solar cycle, heat transport within a two-layer ground, and a high-order 'slopes-scheme' for the advection of heat in the upper atmosphere. The radiative transfer scheme is based on the correlated k distribution method for the treatment of nongray gaseous absorption thermal emission, and multiple scattering, including options for suspended dust. A special feature of the model of particular importance for Mars is a parameterization of gravity-wave-induced drag incorporating orographic forcing, wind shear, convection, and radiative damping. The implementation of the GISS Mars model includes global maps of topography, roughness, and albedo. Derived from text

Gains are the spatial weighting of an observation in its neighborhood versus the local values of a model prediction. They are the key to data assimilation, as they are the direct measure of how the data are used to guide the model. As derived in the broad context of data assimilation by Kalman and in the context of meteorology, for example, by Rutherford, the optimal gains are functions of the prediction error covariances between the observation and analysis points. Kalman introduced a very powerful technique that allows one to calculate these optimal gains at the time of each observation. Unfortunately, this technique is both computationally expensive and often numerically unstable for dynamical systems of the magnitude of meteorological models, and thus is unsuited for use in PMIRR data assimilation. However, the optimal gains as calculated by a Kalman filter do reach a steady state for regular observing patterns like that of a satellite. In this steady state, the gains are constants in time, and thus could conceivably be computed off-line. These steady-state Kalman gains (i.e., Wiener gains) would yield optimal performance without the computational burden of true Kalman filtering. We proposed to use this type of constant-in-time Wiener gain for the assimilation of data from PMIRR and Mars Observer. Derived from text

A DIAGNOSTIC MODEL TO ESTIMATE WINDS AND SMALL-SCALE DRAG FROM MARS OBSERVER PMIRR DATA Abstract Only

J. R. Barnes *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 6 (For primary document see N94-24871 06-91)

Avail: CASI HC A01/MF A01

Theoretical and modeling studies indicate that small-scale drag due to breaking gravity waves is likely to be of considerable importance for the circulation in the middle atmospheric region (approximately 40-100 km altitude) on Mars. Recent earth-based spectroscopic observations have provided evidence for the existence of circulation features, in particular, a warm winter polar region, associated with gravity wave drag. Since the Mars Observer PMIRR experiment will obtain temperature profiles extending from the surface up to about 80 km altitude, it will be extensively sampling middle atmospheric regions in which gravity wave drag may play a dominant role. Estimating the drag then becomes crucial to the estimation of the atmospheric winds from the PMIRR-observed temperatures. An interative diagnostic model based upon one previously developed and tested with earth satellite temperature data will be applied to the PMIRR measurements to produce estimates of the small-scale zonal drag and three-dimensional wind fields in the Mars middle atmosphere. This model is based on the primitive equations, and can allow for time dependence (the time tendencies used may be based upon those computed in a Fast Fourier Mapping procedure). The small-scale zonal drag is estimated as the residual in the zonal momentum equation; the horizontal winds having first been estimated from the meridional momentum equation and the continuity equation. The scheme estimates the vertical motions from the thermodynamic equation, and thus needs estimates of the diabatic heating based upon the observed temperatures. The latter will be generated using a radiative model. It is hoped that the diagnostic scheme will be able to produce good estimates of the zonal gravity wave drag in the Mars middle atmosphere, estimates that can then be used in other diagnostic or assimilation efforts, as well as more theoretical studies. EDDY MIXING COEFFICIENT VALUES DERIVED FROM SIMULATIONS WITH THE NASA AMES MARS GCM Abstract Only

J. R. Barnes and Thomas D. Walsh *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 6-7 (For primary document see N94-24871 06-91)

Avail: CASI HC A01/MF A01

Values of eddy mixing coefficients, especially that for vertical mixing, are of particular importance for various photochemical models of the Mars atmosphere, which are either globally or zonally averaged. These models represent atmospheric transport processes in terms of eddy diffusion. While this is not appropriate for the advective transport by the mean meridional circulation (in general, a part of the eddy diffusion tensor actually does represent advection--a 'correction' to the Eulerian-mean circulation), it can be applied to simulate both the small- and larger-scale eddy transports of an atmospheric constituent. An effort is underway to estimate values of the eddy mixing coefficients for the Mars atmosphere using circulation data generated with the NASA Ames Mars GCM. This model simulates the three-dimensional winds in the atmosphere, and these are then used as inputs for a tracer transport model. The latter model has previously been used in interactive dust transport experiments with the Ames GCM. Idealized tracer transport experiments, with a conservative or nearly conservative hypothetical tracer, are performed to generate data from which the eddy diffusion coefficients can be estimated. Carrying out matched pairs of tracer experiments, using two very different initial states, permits all four components of the diffusion tensor to be determined. A large number of GCM experiments have been conducted, spanning a range of seasons and atmospheric dust loading, allowing the eddy mixing coefficients to be estimated for a variety of atmospheric conditions. MARS DUST-DRIVEN TIDES AND THEIR IMPACT ON THE THERMOSPHERE Abstract Only

Stephen W. Bougher and Richard W. Zurek (Jet Propulsion Lab., California Inst. of Tech., Pasadena.) *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 7-9 (For primary document see N94-24871 06-91)

Avail: CASI HC A01/MF A01

It has been known since the early Mariner 6, 7, and 9 missions that dust loading of the lower atmosphere and the subsequent aerosol heating during dusty periods impacts the martian middle and upper atmospheres. A quantitative measure of this lower atmosphere forcing was obtained by the Viking 1 and 2 landers, from which observed amplitudes of semidiurnal surface-pressure oscillations were correlated with normal-incidence dust optical depths. It appears that the dominant semidiurnal mode is a good indicator of global dust content or mean dust optical depth, especially during dust storm events. A classical tidal model that reproduces the surface pressure oscillations measured by these Viking landers in 1977 was used to calculate tidal amplitudes and phases up to approximately 43 km. These tidal characteristics were calculated for various dust optical depth conditions ranging from typical dusty periods to global dust storm times. Reasonable extrapolations can be made to higher altitudes if one assumes that the vertically propagating tidal modes continue to grow without dissipation or breaking. It is very likely that gravity waves also play an important role in the structure and dynamics of the middle atmosphere of Mars, since the large topographical relief should produce vigorous gravity wave fluxes. Semidiurnal tidal modes, significantly enhanced by lower atmosphere dust-induced heating, may indeed propagate to the Mars thermosphere (approximately less than 100 km) before breaking and generating turbulence. The preferential enhancement of the semidiurnal tides during dust storm onset is primarily due to the elevation of the tidal heating source in a very dusty atmosphere. The (2,2) semidiurnal tidal tidal mode was shown to have the largest variation with dust optical depth, as measured by Viking lander instruments. Also, the (2,2) mode has the largest vertical wavelength of all the semidiurnal tidal modes, and thus is most likely to penetrate into the thermosphere before breaking and to modify the largely in situ solar-driven behavior otherwise expected. The tides may also be partially responsible for determining the height of the martian homopause (approximately 125 km). Derived from text

CLOUD, DUST, AND OZONE VERTICAL PROFILES FROM SOLAR OCCULTATION MEASUREMENTS: IMPLICATIONS FOR DYNAMICS Abstract Only

E. Chassefiere (Observatoire de Paris-Meudon, France.) and J. E. Blamont *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 9-10 (For primary document see N94-24871 06-91)

Avail: CASI HC A01/MF A01

An instrument was designed for solar occultation measurements of the martian atmosphere from the Phobos spacecraft. It was composed of three different dispersive systems working in the ultraviolet (UV: 0.22-0.32 microns) for the measurement of O3 and aerosols, in the near infrared (NIR: 0.76 microns, 0.94 microns) for the detection of O2 and H2O, and in the infrared (IR: 1.9 microns, 3.7 microns) where CO2 and H2O were measured. A detailed description of the instrument may be found in the special issue of Nature. Its principle objective is to measure from the Phobos orbit the spectrum of the Sun, modified by atmospheric extinction, during sunset. The UV-NIR spot has an angular diameter of 1 arcmin, or approximately 3 km vertical resolution, and is located near the center of the solar disk. The IR field is about twice as large and its line of sight is shifted by 8.5 arcmin, or approximately 20 km, relative to the previous one. It is therefore located near the edge of the solar disk. Sampling times are generally 0.5, 1, and 2 s for IR, UV, and NIR channels respectively, corresponding to vertical excursions of the line of sight of 1, 2, and 4 km respectively under nominal conditions. The instrument operated from February 8 to March 26 (the martian equinox occurred on February 17). The latitude of the intersection of the Sun-spacecraft axis with the surface of Mars varied from -11 to +20, the seasonal date L(sub s) being in the range 0 - 20. All measurements were therefore made near northern spring equinox in equatorial regions. Due to an error in the pointing system, only partial results were obtained, the region below approximately equals 30 km altitude being never sounded by the UV-NIR spectrometer. On the contrary, nine complete occultations were obtained in the IR channels, whose line of sight was fortunately approximately equals 20 km below the UV-NIR axis. Author (revised)

PARTICLE SIZES AND COMPOSITION OF MARS ATMOSPHERIC DUST BASED UPON VIKING AND MARINER 9 OBSERVATIONS Abstract Only

R. T. Clancy, S. W. Lee, and G. R. Gladstone (Southwest Research Inst., San Antonio, TX.) *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 10-11 (For primary document see N94-24871 06-91)

Avail: CASI HC A01/MF A01

Mars atmospheric dust can play an important role in the thermal structure of the Mars atmosphere during periods of high dust loading. However, the radiative properties of Mars atmospheric dust remain uncertain due to uncertain definitions of the dust composition and size distribution. The analysis by Toon et al., of Mariner 9 IRIS spectra during the 1971-1972 global dust storm indicated a reasonable match between the modeled 9-micron absorption of montmorillinite and the observed 9-micron absorption. Toon et al. also determined that an effective (cross-section weighted) mean radius of 2.5 microns (R(sub mode) = 0.4 microns) provided a consistent fit of montmorillinite to the IRIS dust spectra at 9 microns. Pollack et al. analyzed Viking lander observations of atmospheric extinction and scattering at visible-near IR wavelengths (0.5-1.0 microns), and obtained consistency with the Toon et al. dust size distribution when the effects of nonspherical particle shapes were included. An additional, minor (1 percent) component of visible-ultraviolet absorbing material was required to model the derived visible (0.86) and ultraviolet (0.4-0.6) single-scattering albedos of the dust, since montmorillinite does not absorb sufficiently in this wavelength region. A combined analysis of the Viking IRTM and Mariner 9 observations was conducted to reassess the model of Mars atmospheric ultraviolet-to-infrared measurements of dust absorption and scattering. The optical constants for palagonite are incorporated in a doubling-adding radiative transfer model of the Mars atmosphere to simulate Mariner 9 IRIS spectra as well as the Viking IRTM IR band observations. Visible and ultraviolet single-scattering albedos based on the Hansen and Travis Mie scattering code were also derived. A tentative conclusion is that smaller dust particles (R(sub mode) = 0.15 microns, cross-section weighted mean R = 1.2 microns) composed of palagonite provide a much improved fit to the Mariner 9 IRIS spectra; agreement with the observed ratio of visible-to-infrared extinction opacities; and ultraviolet and visible single-scattering albedos comparable to their observed values. ASPECTS OF THE MARTIAN GLOBAL CIRCULATION Abstract Only

Michael Collins and I. N. James *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 11-13 (For primary document see N94-24871 06-91)

Avail: CASI HC A01/MF A01

Recent advances in high-speed computers have given atmospheric scientists a new laboratory in which to work. Numerical models of the Earth's atmosphere and its dynamics have provided great insight. Given the lack of observations of the martian atmosphere it is natural to apply such models to help us understand aspects of, for instance, large-scale circulation patterns. A global circulation model of the Earth's atmosphere was modified for use with martian parameters and the relevant regimes of planetary flow were studied. Author (revised)

IMPACT OF THE CO2 AND H2O CLOUDS OF THE MARTIAN POLAR HOOD ON THE POLAR ENERGY BALANCE Abstract Only

Francois Forget and James B. Pollack *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 13-14 (For primary document see N94-24871 06-91)

Avail: CASI HC A01/MF A01

Clouds covering extensive areas above the martian polar caps have regularly been observed during the fall and winter seasons of each hemisphere. These 'polar hoods' are thought to be made of H2O and CO2. In particular, the very cold temperatures observed during the polar night by Viking and Mariner 9 around both poles have been identified as CO2 clouds and several models, including GCM, have indicated that the CO2 can condense in the atmosphere at all polar latitudes. Estimating the impact of the polar hood clouds on the energy balance of the polar regions is necessary to model the CO2 cycle and address puzzling problems like the polar caps assymetry. For example, by altering the thermal radiation emitted to space, CO2 clouds alter the amount of CO2 that condenses during the fall and winter season. The complete set of Viking IRTM data was analyzed to define the spatial and temporal properties of the polar hoods, and how their presence affects the energy radiated by the atmosphere/caps system to space was estimated. The IRTM observations provide good spatial and temporal converage of both polar regions during fall, winter, and spring, when a combination of the first and the second Viking year is used. Only the IRTM brightness temperatures at 11, 15, and 20 microns are reliable at martian polar temperatures. To recover the integrated thermal fluxes from the IRTM data, a simple model of the polar hood, thought to consist of 'warm' H2O clouds lying above colder and opaque CO2 clouds was developed. Such a model is based on the analysis of the IRIS spectra, and is consistent with the IRTM data used. Author (revised)

MULTIANNUAL SIMULATIONS WITH THE MARS CLIMATE MODEL Abstract Only

R. M. Haberle, Howard C. Houben (Space Physics Research Inst., Sunnyvale, CA.), and R. E. Young *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 14 (For primary document see N94-24871 06-91)

Avail: CASI HC A01/MF A01

The martian atmospheric circulaton for 10 Mars years was simulated using a simplified three-dimensional climate model that is briefly described below. Analysis of these simulations reveals several interesting behaviors not previously recognized in other three-dimensional models. The first concerns the potential for interannual variability in the martian climate system. It is now known from the aperiodic frequency of planet-encircling storms, as well as differences in atmospheric water vapor from one year to the next, that the real planet exhibits interannual variations. The results of our simulations also show significant interannual variability and, interestingly, that variability maximizes during southern spring, the dust storm season. A second and related finding is that transient eddies in the southern hemisphere during winter are indeed weaker than their northern hemisphere counterparts as was found in more sophisticated models. However, southern hemisphere eddy activity rises dramatically during spring and is greater than that in the northern hemisphere at any season. Author (revised)

REGARDING TRACER TRANSPORT IN MARS' WINTER ATMOSPHERE IN THE PRESENCE OF NEARLY STATIONARY, FORCED PLANETARY WAVES Abstract Only

Jeffrey L. Hollingsworth, R. M. Haberle, and Howard C. Houben (Space Physics Research Inst., Sunnyvale, CA.) *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 14-15 (For primary document see N94-24871 06-91)

Avail: CASI HC A01/MF A01

Large-scale transport of volatiles and condensates on Mars, as well as atmospheric dust, is ultimately driven by the planet's global-scale atmospheric circulation. This circulation arises in part from the so-called mean meridional (Hadley) circulation that is associated with rising/poleward motion in low latitudes and sinking/equatorward motion in middle and high latitudes. Intimately connected to the mean circulation is an eddy-driven component due to large-scale wave activity in the planet's atmosphere. During winter this wave activity arises both from traveling weather systems (i.e., barotropic and baroclinic disturbances) and from 'forced' disturbances (e.g., the thermal tides and surface-forced planetary waves). Possible contributions to the effective (net) transport circulation from forced planetary waves are investigated. Author (revised)

ANALYZING MARTIAN WINDS AND TRACER CONCENTRATIONS USING MARS OBSERVER DATA Abstract Only
Howard C. Houben *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 15-16 (For primary document see N94-24871 06-91)
Avail: CASI HC A01/MF A01

During the courses of a day, the Mars Observer spacecraft will acquire globally distributed profiles of the martian atmosphere. It is highly desirable that this data be assembled into synoptic weather maps (complete specifications of the atmospheric pressure, temperature, and winds at a given time), which can in turn be used as starting points in the study of many meteorological phenomena. Unfortunately, the special nature of the Mars Observer data presents several challenges above and beyond the usual difficult problem of data initialization. Mars Observer atmospheric data will consist almost exclusively of asynoptic vertical profiles of temperatures (or radiances) and pressures, whereas winds are generally in balance with horizontal gradients of these quantities (which will not be observed). It will therefore be necessary to resort to dynamical models to analyze the wind fields. As a rule, data assimilation into atmospheric models can result in the generation of spurious gravity waves, so special steps must be taken to suppress these. In addition, the asynoptic nature of the data will require a four-dimensional (space and time) data assimilation scheme. The problem is to find a full set of meteorological fields (winds and temperatures) such that, when marched forward in time in the model, they achieve a best fit (in the weighted least-squares sense) to the data. The proposed solution is to develop a model especially for the Mars Observer data assimilation problem. Gravity waves are filtered from the model by eliminating all divergence terms from the prognostic divergence equation. This leaves a diagnostic gradient wind relation between the rotational wind and the temperature field. The divergent wind is diagnosed as the wind required to maintain the gradient wind balance in the presence of the diabatic heating. The primitive equations of atmospheric dynamics (with three principal dependent variables) are thus reduced to a simpler system with a single prognostic equation for temperature - the variable that will be best observed. (This balance system was apparently first derived by Charney as a first-order Rossby number expansion of the equations of motion). Experience with a full primitive equation model of the martian atmosphere indicates that a further simplification is possible: at least for short-term integrations, the model can be linearized about the zonally symmetric basic state. THE ANNUAL PRESSURE CYCLE ON MARS: RESULTS FROM THE LMD MARTIAN ATMOSPHERIC GENERAL CIRCULATION MODEL Abstract Only
Frederic Hourdin, Francois Forget, and O. Talagrand *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 16-17 (For primary document see N94-24871 06-91)
Avail: CASI HC A01/MF A01

We have been developing a General Circulation Model (GCM) of the martian atmosphere since 1989. The model has been described rather extensively elsewhere and only the main characteristics are given here. The dynamical part of the model, adapted from the LMD terrestrial climate model, is based on a finite-difference formulation of the classical 'primitive equations of meteorology.' The radiative transfer code includes absorption and emission by CO2 (carefully validated by comparison to line-by-line calculations) and dust in the thermal range and absorption and scattering by dust in the visible range. Other physical parameterizations are included: modeling of vertical turbulent mixing, dry convective adjustment (in order to prevent vertical unstable temperature profiles), and a multilayer model of the thermal conduction in the soil. Finally, the condensation-sublimation of CO2 is introduced through specification of a pressure-dependent condensation temperature. The atmospheric and surface temperatures are prevented from falling below this critical temperature by condensation and direct precipitation onto the surface of atmospheric CO2. The only prespecified spatial fields are the surface thermal inertia, albedo, and topography. Author (revised)

NORTHERN HEMISPHERE DUST STORMS ON MARS Abstract Only
P. B. James *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 17 (For primary document see N94-24871 06-91)
Avail: CASI HC A01/MF A01

Dust storms in the northern hemisphere of Mars appear to be less common than the more familiar southern hemisphere storms, and essentially, no activity north of about 30 latittude has been documented. The data are, however, subject to an observational bias because Mars is near aphelion during oppositions, which occur during the most likely seasons for dust activity in the north. The amount of dust activity in the northern hemisphere is clearly very relevant to the role of atmospheric transport in the dust cycle. The classic global storms that occur during spring in the southern hemisphere are observed to transport dust from sources in the southern hemisphere to sinks or temporary depositories in the north. The question of whether atmospheric transport can close the dust cycle, i.e., return the dust to the southern hemisphere sources on some timescale, is clearly relevant to the solution of the puzzle of how the dust storm cycle is modulated, i.e., why storms occur in some years but not in others. There are data that suggest that the spring/early summer season in the northern hemisphere of Mars during the year following the major 1977 storms observed by Viking was very dusty. A number of observations of the vicinity of the receding north polar cap showed clear evidence of substantial dust activity in the sub-Arctic region. Author (revised)

THE INFLUENCE OF OROGRAPHY ON THE TRANSPORT OF ATMOSPHERIC CONSTITUENTS Abstract Only
Manoj M. Joshi, Stephen R. Lewis, and Peter L. Read *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 18 (For primary document see N94-24871 06-91)
Avail: CASI HC A01/MF A01

Given the fact that martian orography varies over a range of two scale heights (cf., about one scale height on Earth), it is thought that on Mars some aspects of the circulation should be affected to a large degree by the presence of orography. Initial results from two numerical models are presented that illustrate the effect of orography on cross-equatorial transport on Mars. On Earth, western boundary currents are found not only in the oceans as one would expect, but also in the troposphere, the most notable example being the East African Jet, which has an important effect on the monsoon circulation of the Eastern Indian Ocean. Two models were used for this investigation: a simple GCM (hereafter referred to as the SGCM); and a simple one-level barotropic model (BM). The SGCM solves the hydrostatic primitive equations on a sphere by representing model variables by spherical harmonics in the horizontal, with nonlinear terms being calculated in grid-point space. In the vertical, the model uses the sigma coordinate system in finite-difference form. The model represents the radiative processes in the atmosphere by a Newtonian relaxation to a specified zonal mean temperature state and surface drag by Rayleigh friction in the lowest model level. TEMPORAL AND SPATIAL MAPPING OF SURFACE ALBEDO AND ATMOSPHERIC DUST OPACITY ON MARS Abstract Only
S. W. Lee, R. T. Clancy, and G. R. Gladstone (Southwest Research Inst., San Antonio, TX.) *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 19 (For primary document see N94-24871 06-91)
Avail: CASI HC A01/MF A01

The Mariner 9 and Viking provided abundant evidence that eolian processes are active over much of the surface of Mars. Past studies have demonstrated that variations in regional albedo and wind-streak patterns are indicative of sediment transport through a region, while thermal inertia data (derived from the Viking Infrared Thermal Mapper (IRTM) dataset) are indicative of the degree of surface mantling by dust deposits. The visual and thermal data are therefore diagnostic of whether net erosion or deposition of dust-storm fallout is taking place currently and whether such processes have been active in a region over the long term. These previous investigations, however, have not attempted to correct for the effects of atmospheric dust loading on observations of the martian surface, so quantitative studies of current sediment transport rates have included large errors due to uncertainty in the magnitude of this 'atmospheric component' of the observations. We have developed a radiative transfer model that allows the atmospheric dust opacity to be determined from IRTM thermal observations. Corrections for the effects of atmospheric dust loading on observations of surface albedo can also be modeled. This approach to determining 'dust-corrected surface albedo' incorporates the atmospheric dust opacity, the single-scattering albedo and particle phase function of atmospheric dust, and the bidirectional reflectance of the surface, and it accounts for variable lighting and viewing geometry. Author (revised)

DYNAMICS OF THE ATMOSPHERE OF MARS: REVIEW OF SOME OUTSTANDING PROBLEMS Abstract Only
Conway B. Leovy *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 19 (For primary document see N94-24871 06-91)
Avail: CASI HC A01/MF A01

Theoretical and modeling studies based on fragmentary data are responsible for our current level of understanding of the dynamics of Mars' atmosphere at the planetary scale. Largely because the boundary conditions and governing parameters are such that the large-scale circulation regime is similar to that or Earth, it has been possible to derive a remarkable amount of information from a relatively small number of observations. Nevertheless, the level of detail available from theoretical and modeling studies far exceeds the validation capability of existing data. Global observations from Mars Observer instruments are expected to go far to remedy this mismatch. This review will present and examine several outstanding dynamical questions, which Mars Observer measurements should help to answer. These include the following: What are the temporal and three-dimensional spatial distributions of thermal tides? What is the distribution of momentum flux divergence due to internal gravity waves? Are normal modes an important component of the general circulation? If so, how do they vary with season? Do normal modes contribute to the initiation of planetary-scale dust storms? What are the details of the global circulation response to large and rapid injections of dust? Current understanding of these problems, the potential role of Mars Observer observations for addressing them, and the implications of answers for our understanding of the present climate and past climate regimes will be discussed. MODELING AND DATA ASSIMILATION FOR MARS OBSERVER Abstract Only
Stephen R. Lewis and Peter L. Read *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 19-20 (For primary document see N94-24871 06-91)
Avail: CASI HC A01/MF A01

The Mars Observer mission will return a substantial set of meteorological data for the atmosphere of Mars, principally in the form of thermal infrared soundings from the Pressure Modulator Infrared Radiometer (PMIRR). The dataset will enable global studies of a range of dynamical and physical phenomena in the martian atmosphere. The solar orbital configuration of Mars Observer, however, means that the coverage of the martian atmosphere and surface by remote sounding instruments will be asynchronous. This leads to difficulties of interpretation when studying synoptic-scale phenomena with timescales of a few days. In an attempt to overcome such problems we propose to use data assimilation techniques, as currently employed for operational weather forecasting on the Earth, in conjunction with a Martian General Circulation Model (MGCM) that is under development at Oxford and Reading Universities. An overview of the model and assimilation scheme will be given, with reference to problems encountered so far in applying such methods to remote-sensing observations of the martian atmosphere. ESDU

Mars Operational Environmental Satellite (MOES) is a Discovery concept mission that is designed to observe the global short-term weather phenomena on Mars in a systematic fashion. Even after the Mariner, Viking, and, soon, Mars Observer missions, crucial aspects of the martian atmosphere will remain unobserved systematically. Achieving a better understanding of the cycles of dust, water vapor, and ices on Mars requires detailed information about atmospheric transports of those quantities associated with the weather systems, particularly those arising in mid latitudes during fall and winter. It also requires a quantitive understanding of the processes responsible for the onset and evolution of dust storms on all scales. Whereas on Earth the system of geosynchronous and polar orbiting satellites provides continuous coverage of the weather systems, on Mars the time history of important events such as regional and global dust storms remains unobserved. To understand the transport of tracers in the martian atmosphere and particularly to identify their sources and sinks, it is necessary to have systematic global, synoptic observations that have yet to be attained. Clearly these requirements are not easy to achieve from a single spacecraft in orbit, but if we focus on specific regions of the planet, e.g., polar vs. low and mid latitudes, then it is possible to attain a nearly ideal coverage at a reasonable spatial and temporal resolution with a system of just two satellites. Mars Observer is about to yield good coverage of the polar latitudes, so we focus initially on the region not covered well in terms of diurnal coverage, and in terms of desired observations will provide the initial data for the numerical models of the martian weather and climate that can be verified only with better temporal and spatial data. Global maps of 9-micron dust opacity derived from radiometric observations made by the Viking Orbiter IR Thermal Mapper instruments have revealed a wealth of new information about the distribution of airborne dust over 1.36 Mars years from 1976-1979. In particular, the changing dust distribution during major dust storms is of interest since the data provide a point of contact with both Earth-based observations of storm growth and with global circulation models. In theory, a thermal emission spectrum of Mars (220-1600 cm(exp -1)) contains a wealth of information about the composition and thermal structure of the atmosphere and surface. However, in practice, the ability to retrieve quantitative information from the spectrum is limited by a number of factors including (1) the ill-posed nature of the spectral inversion problem and the resulting nonuniqueness of all solutions; (2) assumptions built into any spectral inversion program; (3) uncertainties in surface pressure, temperature, and emissivity; and (4) uncertainties in the optical properties of atmospheric aerosols. Below, factors (1) and (2) are discussed as fundamental limitations on temperature retrievals from Mariner 9 Infrared Interferometer Spectrometer (IRIS) spectra. In preparation for the Mars Observer mission and the return of tens of thousands of infrared spectra per day from the Thermal Emission Spectrometer (TES), we have developed a fast inversion algorithm to retrieve temperature structure and aerosol opacity from the infrared spectra. The derived atmospheric models will be used to provide the atmospheric contribution to the TES spectra, so that the thermal emission spectra of the underlying surface can be determined for making mineralogical identifications. As a test of our algorithm, we are undertaking a systematic analysis of the entire Mariner 9 Infrared Interferometric Spectrometer (IRIS) dataset of 21,000 plus spectra. While portions of the IRIS dataset have been previously analyzed, the lack of a speedy and robust algorithm to invert the IRIS spectra to retrieve temperature profiles and aerosol opacities has been a major impediment to a truly comprehensive analysis. DUST TRANSPORT IN THE MARTIAN ATMOSPHERE Abstract Only

James R. Murphy *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 25-27 (For primary document see N94-24871 06-91)

Avail: CASI HC A01/MF A01

Dust in suspension within the martian atmosphere is an important driver of the atmospheric thermal and, ultimately, dynamical states. By virtue of its presence in the atmosphere, this suspended dust is susceptible to transport by the winds and thus the location from which dust is lifted from the surface is not necessarily the location at which it will return to the surface. Such surface dust lifting and subsequent transport, when accumulated over daily, seasonal and annual time intervals define the martian dust cycle. The atmospheric transport element (and equally surface lifting and redeposition) of this cycle is strongly dependent upon season and the quantity of dust in suspension. The seasonal dependence arises due to the dominance of particular components of the atmospheric circulation at particular locations (latitudes) at various times through the year. The dependence on dust abundance is due to the amount of dust available for transport, but it is also due to the influence that the dust has on the intensity of the circulation. As dust abundance and therefore its radiative influence increases, some components of the circulation intensity (Hadley circulation, thermal tides), while some components may decline in intensity (baroclinic waves, condensation flow). For these reasons, our ability to understand the martian dust cycle is dependent on our ability to define the contributions that various circulation components, under varying seasonal and dust-radiative forcings, play in the transport of dust around the planet. THREE-DIMENSIONAL NUMERICAL SIMULATION OF NEAR-SURFACE FLOWS OVER THE MARTIAN NORTH POLAR CAP Abstract Only

Thomas R. Parish and A. D. Howard (Virginia Univ., Charlottesville.) *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 27-30 (For primary document see N94-24871 06-91)

Avail: CASI HC A01/MF A01

Measurements made by Viking Lander VL-2 (48 N) have shown that the near-surface wind and temperature regime on Mars displays striking similarities to terrestrial counterparts. The diurnal radiative cycle is responsible for establishment of a well-defined thermal circulation in which downslope (Katabatic) flows prevail during the nighttime hours and weak upslope (anabatic) conditions prevail during the daytime. Previous work has indicated that the slope flows are much like those found on Earth, particularly the Katabatic winds, which show striking similarities to drainage flows observed over Antarctica. The low-level wind regime appears to be an important factor in the scouring of the martian landscape. The north polar cap shows evidence of eolian features such as dunes, frost streaks, and grooves from Viking imagery. The direction of the prevailing wind can in cases be inferred from the eolian features. We examine the thermally induced flows that result from the radiative heating and cooling of the martian north polar region using a comprehensive three-dimensional atmospheric mesoscale numerical model. The same model has been used previously for simulation of Antarctic Katabatic winds. The model equations are written in terrain-following coordinates to allow for irregular terrain; prognostic equations include the flux forms of the horizontal momentum equations, temperature, continuity. A surface energy budget equation is also incorporated in which the surface temperature is determined. Explicit parameterization of both terrestrial (longwave) and solar (shortwave) radiation is included. Turbulent transfer of heat and momentum in the martian atmosphere is assumed to follow the similarity expressions in the surface boundary layer on Earth. The terrain heights for the martian north polar region have been obtained from the U.S. Geological Survey map and digitized onto a 57x57 grid with a spacing of 75 km. The resulting terrain map is shown in Fig. 1. The vertical grid consists of 15 levels (delta equals 0.998, 0.99, 0.98, 0.97, 0.96, 0.94, 0.92, 0.90, 0.85, 0.775, 0.70, 0.60, 0.50, 0.30, 0.10). The high resolution in the lower atmosphere is necessary to capture details of the boundary layer flows. The lowest level corresponds to a height of approximately 20 m above the ground, the seconds level 100 m. Derived from text

We have carried out numerical experiments with a general circulations model (GCM) and energy balance model of the martian atmosphere to define the importance of heat transported to the polar regions in determining the amount of CO2 condensed on the surface during the fall and winter seasons and the amount sublimated during the spring and summer seasons. In so doing, we performed both sensitivity experiments, in which the dust opacity was varied over the full range of its observed values, and annual simulations, in which the dust opacity varied continuously with seasonal data, in accord with measurements taken at the Viking landers. Dust opacity represents the key variable for determining the contribution of atmospheric heat advection to the energy budget in the polar regions. The amount of heat advected to the winter polar regions increases monotonically as the dust opacity at low and middle latitudes increases. However, the increase is sharpest between optical depths of 0 and 1 tends to level off at still higher optical depths. Heat advection is more important at times of CO2 condensation than CO2 sublimation, since the temperature gradients are much steeper in the winter hemisphere than in the summer hemisphere. Because dust opacity is much higher during northern winter than during southern winter, atmospheric heat advection reduces the amount of CO2 that condenses in the north by a much larger factor than it does in the south. EDDY MIXING COEFFICIENT UPPER LIMIT DERIVED FROM THE PHOTOCHEMICAL BALANCE OF O2 Abstract Only

J. Rosenqvist and E. Chassefiere (Centre National de la Recherche Scientifique, Verrieres-Le Buisson, France.) *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 30-32 (For primary document see N94-24871 06-91)

Avail: CASI HC A01/MF A01

This work is based on the study of the photochemical balance of molecular oxygen in the martian atmosphere by using a one-dimensional model of photochemical reactions involving species derived from CO2 and H2O. The model is basically similar to one used previously for the study of the regulation of CO on a global scale, but the chemical rates are taken from another source. In the present scheme, the regulation of molecular oxygen is studied over timescales of the order of its photochemical lifetime (approximately equals 30 yr), which is much shorter than typical escape timescales. Thus, the escape fluxes are fixed to the values given by 3 and 4. We examine the calculated equilibrium abundances of O2 for given thermal, eddy diffusion coefficients and H2O profiles. The thermal profile is taken from in the lower atmosphere. At higher levels, in order to include the diurnal and seasonal thermal profile variability, we have also used the IRTM data. In order to study the influence of both temperature and pressure profiles on the O2 mixing ratio, we have made several tests corresponding to different martian seasons. The results show that the influence of pressure and temperature is quantitatively weak compared to the one of K and of the water vapor density (H2O). Thus, in the following we have fixed the pressure at the surface to a value of 7 mbar and we have used unique standard thermal profile corresponding to a profile roughly averaged over the year, the season, and the day: T equal 205 K at 0 km altitude, 175 K at 25 km, and 145 K at 50 km. The circulation of the martian atmosphere during late southern summer is inferred from observed atmospheric temperature and dust distributions. We use global maps of temperature and dust optical depth (approximately 0-60 km) retrieved from a subset of the Mariner 9 IRIS thermal emission spectra spanning L(sub s) equals 343-348 deg. This thermal structure is characterized by a reversed meridional temperature gradient at altitudes above about 40 km, and temperatures that decrease from equator to pole at lower altitudes. Zonal-mean zonal winds are derived from the zonally averaged temperatures assuming gradient wind balance and midlatitude westerly jets with velocities of 80-90 m s(exp -1) near 50 km; in the southern tropics the winds are easterly with velocities of 40 m s(exp -1) near 50 km. The north-south atmospheric transport includes contributions from both the zonal mean meridional circulation and large-scale waves. Author

According to Mariner 9 and Viking observations the surface albedo and the thermal inertia of Mars' surface vary substantially, and fairly large gradients also occur. The Syrtis Major region is bounded in the west by high-albedo cratered terrain and in the east by Isidis Planitia, a high-albedo plateau. Sinus Meridiani, centered at 0 degrees W 5 degrees S, is almost surrounded by higher albedo regions with sharp boundaries, and Acidalia Planitia, between 10 and 50 degrees W and north of 35 degrees N, has sharp albedo boundaries to the east and west. Observational and modeling studies, e.g., on Australian dry salt lake coasts, have shown that discontinuities and gradients in surface properties can induce mesoscale circulations. We have used a version of the DMUH mesoscale model to simulate atmospheric circulations induced by variations in the reflectivity and in the thermal inertia of the martian surface. Author

There is some evidence that the thermal structure of the martian middle atmosphere may be altered in a significant way by the general circulation motions. Indeed, while it is well known that the circulation in the meridional plane is responsible for the reversal of the latitudinal thermal gradient at the solstice through the adiabatic heating due to sinking motions above the winter pole, here we want to emphasize that a likely by-product effect could be the formation of warm layers, mainly located in the winter hemisphere, and exhibiting an inversion of the vertical thermal gradient. Analysis of the Mariner 9 IRIS and Viking Orbiter IRTM temperature data and of the time series of surface pressure from the Viking landers has indicated that atmospheric thermal tides are a significant component of the martian general circulation. Classical tidal theory, considering only the Sun synchronous components, has been shown to at least roughly account for the amplitudes of the observed diurnal and semidirunal surface pressure oscillations. In particular, Zurek and Leovy have demonstrated that classical tidal theory can reproduce the observed dependence of the strength of the semidiurnal tide on aerosol optical depth. The high-amplitude topograph of Mars, however, can cause longitudinal distortions in the thermotidal forcing, leading to additional tidal modes that are not Sun synchronous. In particular, observation and theory have suggested the likely presence of a diurnal, zonal wavenumber-1 K wave. Hamilton and Garcia noted that the wavenumber-1 K normal mode has a period of close to 24 hr and may be detectable in surface pressure observations. Zurek has discussed the possibility of this mode being resonantly excited for various atmospheric temperature studies. The semidiurnal wavenumber-2 K mode, with roughly a 12-hr period, could also be resonantly excited. A numerical model with finite amplitude topography and a self-consistent thermotidal forcing resulting from the daily heat flux at the surface and atmospheric absorption of solar radiation by aerosols is used here to explore the influence of topography on martian thermal tides and to examine the possibility of Kelvin wave resonance. We are continuing our examination of the transport of H2O through the martian boundary layer, and we have written a one-dimensional numerical model of the exchange of H2O between the atmosphere and subsurface of Mars through the planetary boundary layer (PBL). Our goal is to explore the mechanisms of H2O exchange, and to elucidate the role played by the regolith in the local H2O budget. The atmospheric model includes effects of Coriolis, pressure gradient, and frictional forces for momentum, as well as radiation, sensible heat flux, and advection for heat. The model differs from Flasar and Goody by use of appropriate Viking-based physical constants and inclusion of the radiative effects of atmospheric dust. We specify the pressure gradient force or compute it from a simple slope model. The subsurface model accounts for conduction of heat and diffusion of H2O through a porous adsorbing medium in response to diurnal forcing. The model is initialized with depth-independent H2O concentrations (2 kg M(exp -3)) in the regolith, and a dry atmosphere. The model terminates when the atmospheric H2O column abundance stabilizes at 0.1 percent per sol. Derived from text

THE MARS AERIAL PLATFORM (MAP) MISSION Abstract Only
R. Zubrin (Martin Marietta Corp., Denver, CO.), T. Gamber (Martin Marietta Corp., Denver, CO.), Benton Clark (Martin Marietta Corp., Denver, CO.), R. M. Haberle, J. Cantrell (Utah State Univ., Logan.), and S. Price (Martin Marietta Corp., Denver, CO.) *In* Lunar and Planetary Inst., Workshop on Atmospheric Transport on Mars 1993 p 40-42 (For primary document see N94-24871 06-91)
Avail: CASI HC A01/MF A01

The Mars Aerial Platform (MAP) mission is a conceptual design for a low-cost, Discovery-class mission whose purpose would be to generate tens of thousands of very-high-resolution (20 cm/pixel) pictures of the martian surface, map the global circulation of the martian atmosphere, and examine the surface and subsurface with ground-penetrating radar, infrared spectroscopy, neutron spectroscopy, and other remote sensing techniques. The data would be acquired by instruments that are carried by balloons

flying at a nominal altitude of about 7 km over the martian surface. Because new balloon and microspacecraft technology is now available, the balloon probes could be quite long-lived, lasting hundreds or even thousands of days, producing an immense science harvest in the process. Together with the Mars Environmental Survey (MESUR) surface network science mission, MAP would revolutionize our knowledge of the Red Planet.

The Pressure Modulator Infrared Radiometer (PMIRR) is an atmospheric sounder designed to observe temporal and spatial variations of water vapor and of dust suspended in the Mars atmosphere, to characterize the planetary-scale thermal structure and circulation of the atmosphere, and to quantify the polar radiative balance. These measurements are fundamental to understanding the seasonal cycles of dust, of water, and of CO2 on Mars and, in particular, to determining the role of atmospheric transport. Using measurements in eight narrow-band infrared spectral regions and one broadband visible channel, the PMIRR investigation teams at JPL and Oxford University will derive vertical profiles of atmospheric temperature, extinction due to suspended dust, and water vapor concentration, as well as locations of CO2 and H2O ice clouds. These data will be used in a variety of ways to address issues of atmospheric dynamics and transport. Three topics will be emphasized here: (1) the expected precision of the retrieved profiles of temperature, dust extinction, and water vapor, including plans for validating the profiles; (2) the observation strategy, designed to best use PMIRR's two-axis scan mirror, as deployed in the Mars Observer mapping orbit; and (3) approaches to mapping the atmospheric fields globally and the derivation of key meteorological fields related to estimating atmospheric transport.

THE GEOPHYSICAL SIGNAL OF THE MARTIAN GLOBAL DICHOTOMY Abstract Only
Roger J. Phillips *In its* Tectonic Evolution of Mars 30 Apr. 1992 1 p (For primary document see N94-24996 06-91)
Avail: CASI HC A01/MF A01

A first-order tectonic question for Mars is the origin and nature of the global dichotomy (GD) separating approximately the northern and southern hemispheres of the planet. It is appropriate to focus on hypotheses for the origin of the GD as well as on geophysical models of related internal structure that are constrained by present-day observations. There are basic planetary scale observations that relate to the GD: (1) the dichotomy boundary separates two fundamentally different elevations on the planet, as the terrain to the north is lower by an average of about 3 km; (2) the boundary separates terrain of regionally distinct crater ages, heavily cratered (older) in the south and sparsely cratered (younger) in the north; (3) the amount of ancient crust apparently removed from north of the dichotomy boundary cannot be accounted for by simple surface erosion and deposition in the south, and the constraint becomes particularly severe if isostatic adjustment is presumed to have accompanied this process. This last point leads to the supposition that some type of interior process must have been responsible for the creation of the GD. An obvious way to create the observed elevation difference between the two hemispheres is with a thinner crust in the north, although a denser cust would also work. Hypotheses for producing a thinner northern crust include preferential sub-crustal erosion, a giant impact, and simply invoking the crustal thickness difference as a primordial feature of the planet. If the GD represents a fundamental change in the crustal thickness of Mars, then there should be geophysical evidence of this. The center-of-figure to center-of-mass offset of the planet may be related to the GD, but the Tharsis topography must certainly also contribute. If the Tharsis and GD effects can be separated, then a crustal thickness model can be tested, though the results will not be unique. The gravity field provides another geophysical constraint on GD models. A simple change in thickness of an isostatically compensated crust should show a characteristic gravity signal across the dichotomy boundary. There is a gravity anomaly that is clearly associated with the boundary in regions where the gravity signal is not cluttered by contributions from other features such as Tharsis and Elysium. The gravity signal has a complex spatial relationship with the boundary, and efforts are presently underway to model this anomaly.

Key issues in solar astrophysics are addressed: some challenging problems of the structured and dynamical solar atmosphere; keys to understanding the corona; goals of ground based solar observations; and prospects for future solar wind missions. Prospects for future ground based solar observations and for improved instrumentation on future solar space missions are considered. ESA, NASA and Japanese solar physics projects are reviewed. The Coronas (complex orbital near Earth observations of solar activity) project is addressed. Prospects for very high resolution solar physics with the SIMURIS (solar, solar system, and stellar interferometric mission for ultrahigh resolution imaging and spectroscopy) are considered. Requirements for future solar physics missions with x-ray and ultraviolet instrumentation are given. Reasons for putting visible solar telescopes in space are also given. For individual titles, see N94-22838 through N94-22851.

Several current but long standing problems of the solar photosphere are presented, along with suggestions which may help resolve them in the future. Particular emphasis is given to phenomena and processes involving the solar magnetic field. The problems addressed include the following: magnetostatics and magnetoconvection; chromospheric heating; solar oscillations; solar flare; and abundance variation in the corona/solar wind. These problems may best be addressed in the future by means of carefully coordinated ground and space based observations. ESA

The theoretical understanding of the solar corona involves such different phenomena as the coronal heating and the occurrence of flares. It is argued that all of these phenomena could be seen as a manifestation of the same basic physics, the differences being a question of coherence. The theoretical work needed to support this view and its possible impact on future observational strategies are outlined. ESA

Advantages and disadvantages of ground based solar observations are discussed. Fruitful observations form spacecraft as well as from ground based observatories both require close and coordinated cooperation between observers and theoreticians. Advantages of ground based observations are the possibilities for studying long term variations (many years), even outside active regions, and the fact that large telescopes with complex instrumentation can be used. Disadvantages are the limitations on the usable wavelength region and the distorting influence of the Earth's atmosphere. Promising attempts to minimize these distortions have, however, been made by applying new technologies. Nevertheless, observations of very small structures (less than or equal to 0.2 arcsec) in the visible region over extended periods (many hours) will probably forever remain the domain of spaceborne instrumentation. Possible activities and future goals for solar wind research in the post Soho era are discussed. Two major enterprises which will open up important fields in the future study of the Sun are addressed. The first deals with in situ study of the solar corona, a region that has not been accessible for direct study in the past. This exploratory work will include the coronal heating and the acceleration of the solar wind much closer to its origin and the determination of the charge states of a large number of ions as a diagnostic tool for fractionation processes in these regions. The second major goal will be the setting up of a baseline for the isotopic composition in the solar system by studying a sample from the Sun in detail. These studies will be complemented by a direct comparison with extra solar samples of interstellar pick up ions, which become accessible with the same instrumentation as is necessary for the detailed investigation of the solar wind's isotopic composition. In order to achieve these goals, advanced composition experiments are developed to investigate the solar wind with enhanced mass resolution, considerably increased geometrical factor, and improved time resolution. The placing of sophisticated mass/charge spectrometers, with the ability to investigate both charge and velocity distributions with enhanced time resolution, in the solar wind acceleration region, is also proposed. The complementary aspects of solar ground based and space instrumentation are discussed and plans for future ground based solar observing facilities are reviewed. Prospects for high spatial resolution observations from the ground which are discussed are: correlation tracking, adaptive optics, and speckle interferometry. Plans for ground based solar instrumentation include polarimetry, coronagraphy, observations in infrared, helioseismology, monitoring of solar variability (synoptic studies), and telescopy. ESA

The status of space based instrumentation at the time of the Soho launch is summarized, the areas where improvements are foreseeable are examined, and an overview of the gains that can be achieved is presented. Special attention is paid to identifying intrinsic limitations related to classical mountings in the UV and EUV range. Some mountings are discussed, with their limitations, in the context of missions already proposed. The present capabilities of solar physics instrumentation in space are on the 1 arcsec angular resolution domain, with a resolving power near 30,000, and the ability to fit spectral line profiles and to establish line of sight velocities down to 1 km/s. Few rocket instruments have yet crossed the 1 arcsec angular resolution threshold. The goal of the next generation of solar instrumentation in space is to achieve 0.1 arcsec angular resolution whilst retaining the same spectral resolution and improving the temporal resolution. ESA

SOLAR PHYSICS WITHIN ESA'S PLANNING
M. C. E. Huber *In its* Scientific Requirements for Future Solar-Physics Space Missions Jun. 1993 p 81-93 Original contains color illustrations (For primary document see N94-22837 06-92)

The role of solar physics in past ESRO and ESA missions and mission studies is described. The preparation of 'Horizon 2000', which resulted in Soho becoming an approved project in ESA's scientific program, is discussed. The current studies of solar physics missions within ESA are reviewed, and 'rules' that should be kept in mind by European solar scientists planning a future mission are suggested. After a promising start in ESRO, with solar astronomy experiments being flown on two early satellites (ESRO 2 in 1968 and TD 1 in 1972), solar astronomers were not able to participate again in the ESRO/ESA programs until the Soho mission was approved in

1986. Nevertheless, in the meantime European solar astronomers developed a vigorous scientific endeavour by participating in national balloon, rocket and satellite programs and also serving as experimenters on, or by participating in the scientific operations of, NASA or ISAS (Japanese Institute of Space and Astronautical Science) satellite missions (OSO, Skylab, Yohkoh). In parallel, solar physics (if not solar astronomy) experiments continued to be flown on ESRO and ESA satellites. From the mid seventies, studies of solar astronomy missions began to reappear at ESA. It was then realized that pure solar astronomy would have little chance of being recommended for a mission by the ESA advisory structure, and that a wider scientific appeal was required. Accordingly, hybrid remote sensing and particle observatories began to appear. Soho was eventually successful, as it was proposed together with the Cluster space plasma physics mission to form a solar terrestrial science 'Cornerstone' for ESA's Horizon 2000 Long Term Scientific Program. It is also noted that a purely European solar physics mission is probably not viable either, another international partner is necessary. ESA

Findings of the Yohkoh satellite about solar corona dynamics are described. Another mission planned by the Japanese solar team for around the year 2000 is addressed. The major objective of the next mission is to find the causes of the coronal dynamics discovered by Yohkoh, and to search for the mechanisms of the coronal and chromospheric heating by simultaneously observing the motions of photospheric magnetic flux tubes and the resultant heating and dynamics of the chromosphere and corona. For this purpose, it is proposed that the core instruments should consist of an optical telescope of less than or equal to 80 cm aperture and 0.1 to 0.2 arcsec resolution, and soft X-ray telescope(s) with resolution better than 1 arcsec. The former should have a magnetograph/Dopplergraph and H alpha plus CaK imagers. Once combined, it will be possible also to study the driving mechanisms of various phenomena such as spicules, fibrils and newly discovered x-ray jets, and prominences, sunspots, and needless to say flares. The objectives and necessary methods of observation are discussed. Only a very rough idea of the instrumentation is given, including some discussion of EUV and other instruments. The mission is expected to be conducted by an international team. ESA

The three basic problems facing solar physics are addressed. These concern the internal structure of the Sun and the process of transfer of energy from the deeper layers towards the surface; the investigation of solar activity, its mechanism and its influence on the near Earth environment; and the transfer and storage of energy in the upper layers of the solar atmosphere, where the extremely high temperatures of the upper corona are yet to be explained. A future space project which hopes to shed a new light on these problems, the complex orbital near Earth observations of solar activity (Coronas) project and its scientific targets are considered. The Simuris (Solar, Solar System, and Stellar Interferometric Mission for Ultrahigh Resolution Imaging and Spectroscopy) mission, its scientific objectives, instrument concepts and system design, are addressed. Simuris employs advanced interferometric techniques. Its payload includes two major instruments, which are the Solar Ultraviolet Network (SUN), an interferometric array of four 20 cm telescopes on a 2 m baseline, and the Imaging Fourier Transform Spectrometer (IFTS), which uses light from a 40 cm Gregory telescope. Both instruments have active pointing capabilities of 3 mas stability, and in addition SUN has an active cophasing control to 1/50th of a wavelength. EUV multilayer telescopes complete the payload for diagnostics of the very high temperature plasma. ESA

Several overall requirements for solar x-ray missions are stated and an outline of the underlying coronal physics is presented. The available techniques for x-ray imaging of the Sun are discussed and compared with reference to previous and ongoing missions. Solar x-ray spectroscopy is assessed in the same manner. Possible choices for future instruments in these two areas are discussed. X-rays are taken to lie broadly in the photon energy range 0.1 to 100 keV. Solar studies at these energies will be mainly concerned with high temperature coronal plasma and nonthermal radiation from particle beams produced in flares. ESA

Reasons why UV solar physics has always been the centerpiece of solar research from space are given: ultraviolet solar radiation shortward of 300 nm is absorbed by the Earth's atmosphere and therefore, can only be explored from space; the solar UV is the dominant energy source of the upper Earth atmosphere; the outer solar atmosphere from the transition region into the corona emits most of its radiation in the ultraviolet. For these reasons, ultraviolet solar research can be divided into two categories: the measurement of solar ultraviolet irradiance with no spatial resolution for Earth atmosphere applications; and high spatial and spectral spectroscopy and imaging of the solar atmosphere for diagnostics of the solar plasma. A radiochemical (Ga-71)-(Ge-71) experiment to determine the primary flux of neutrinos from the Sun began measurements of the solar neutrino flux at the Baksan Neutrino Observatory in 1990. The number of Ge-71 atoms extracted from 30 tons of gallium in 1990 and from 57 tons of gallium in 1991 was measured in twelve runs during the period of January 1990 to December 1991. The combined 1990 and 1991 data sets give a value of 58 + 17/-24 (stat) +/- 14 (syst) SNU. This is to be compared with 132 SNU predicted by the Standard Solar Model. DOE

ACCELERATOR-BASED NEUTRINO OSCILLATION SEARCHES
D. A. Whitehouse, R. Rameika, and N. Stanton 1993 7 p Presented at the Future Directions in Particle and Nuclear Physics at Multi-GeV Hadron Beam Facilities, Upton, NY, 4-6 Mar. 1993
(Contract W-7405-eng-36)
(DE94-000818; LA-UR-93-3408; CONF-930389-24) Avail: CASI HC A02/MF A01

This paper attempts to summarize the neutrino oscillation section of the Workshop on Future Directions in Particle and Nuclear Physics at Multi-GeV Hadron Beam Facilities. There were very lively discussions about the merits of the different oscillation channels, experiments, and facilities, but we believe a substantial consensus emerged. First, the next decade is one of great potential for discovery in neutrino physics, but it is also one of great peril. The possibility that neutrino oscillations explain the solar neutrino and atmospheric neutrino experiments, and the indirect evidence that Hot Dark Matter (HDM) in the form of light neutrinos might make up 30% of the mass of the universe, point to areas where accelerator-based experiments could play a crucial role in piecing together the puzzle. At the same time, the field faces a very uncertain future. The LSND experiment at LAMPF is the only funded neutrino oscillation experiment in the United States and it is threatened by the abrupt shutdown of LAMPF proposed for fiscal 1994. The future of neutrino physics at the Brookhaven National Laboratory AGS depends on the continuation of High Energy Physics (HEP) funding after the RHIC startup. Most proposed neutrino oscillation searches at Fermilab depend on the completion of the Main Injector project and on the construction of a new neutrino beamline, which is uncertain at this point. The proposed KAON facility at TRIUMF would provide a neutrino beam similar to that at the AGS but with a much increased intensity. The future of KAON is also uncertain. Despite the difficult obstacles present, there is a real possibility that we are on the verge of understanding the masses and mixings of the neutrinos. The physics importance of such a discovery cannot be overstated. The current experimental status and future possibilities are discussed. DOE

THE CALCULATION OF THEORETICAL CHROMOSPHERIC MODELS AND THE INTERPRETATION OF SOLAR SPECTRA FROM ROCKETS AND SPACECRAFT Final Report, 1 Jul. 1974 - 31 Dec. 1992
Eugene H. Avrett Dec. 1993 10 p
(Grant NsG-7054)
(NASA-CR-195083; NAS 1.26:195083) Avail: CASI HC A02/MF A01

Since the early 1970s we have been developing the extensive computer programs needed to construct models of the solar atmosphere and to calculate detailed spectra for use in the interpretation of solar observations. This research involves two major related efforts: work by Avrett and Loeser on the Pandora computer program for non-LTE modeling of the solar atmosphere including a wide range of physical processes, and work by Kurucz on the detailed synthesis of the solar spectrum based on opacity data for over 58 million atomic and molecular lines. Our goals are to determine models of the various features observed on the Sun (sunspots, different components of quiet and active regions, and flares) by means of physically realistic models, and to calculate detailed spectra at all wavelengths that match observations of those features. These two goals are interrelated: discrepancies between calculated and observed spectra are used to determine improvements in the structure of the models, and in the detailed physical processes used in both the model calculations and the spectrum calculations. The atmospheric models obtained in this way provide not only the depth variation of various atmospheric parameters, but also a description of the internal physical processes that are responsible for non-radiative heating, and for solar activity in general. AN ANALYSIS OF SOLAR MESOSPHERIC TEMPERATURES FOR THE UPPER STRATOSPHERE AND MESOSPHERE Final Report
R. Todd Clancy and David W. Rusch Dec. 1993 57 p
(Grant NAGw-2130)
(NASA-CR-194861; NAS 1.26:194861) Avail: CASI HC A04/MF A01

We proposed to analyze Solar Mesosphere Explorer (SME) limb profiles of Rayleigh scattered solar flux at wavelengths of 304, 313, and 443 nm to retrieve atmospheric temperature profiles over the 40-65 km altitude region. These temperatures can be combined with the previous analysis of SME 296 nm limb radiances to construct a monthly average climatology of atmospheric temperatures over the 40-90 km, upper stratosphere-mesosphere region, with approximately 4 km vertical resolution. We proposed to investigate the detailed nature of the global temperature structure of this poorly measured region, based on these 1982-1986 SME temperatures. The average vertical structure of temperatures between the stratopause and mesopause has never been determined globally with vertical resolution sufficient to retrieve even scale-height structures. Hence, the SME temperatures provided a unique opportunity to study the detailed thermal structure of the mesosphere, in advance of Upper Atmosphere Research Satellite (UARS) measurements and the Thermosphere Ionosphere Mesosphere Energy and Dynamics (TIMED) mission. THE RESONANCE LINES OF MG2 AS DIAGNOSTICS OF THE UPPER SOLAR CHROMOSPHERE Final Report, 1 Nov. 1991 - 30 Apr. 1993
Eugene H. Avrett Jan. 1994 9 p
(Grant NAGw-2814)
(NASA-CR-195084; NAS 1.26:195084) Avail: CASI HC A02/MF A01

The resonance lines of singly ionized magnesium, the MgII h&k lines at about 280 nm, are two of the small number of lines in the solar spectrum that are optically thick in the chromospheric part of the solar atmosphere. Potentially these lines contain information on the initial temperature rise that occurs at the top of the photosphere. Unfortunately, few good observations of the lines exist due to their wavelength near 280 nm the ultraviolet. However, a fair number of observations (on the order of 200) are available from the data base of the UltraViolet Polarimeter and Spectrometer (UVSP) instrument that flew on board of NASA's Solar Maximum Mission (SMM) satellite. In addition, this data base contains a number of spectra that include the Mg I resonance line at (lambda)285.2nm, just longward of the h&k lines. The neutral magnesium line is not as strong as its ionic counterparts and samples slightly lower parts of the atmosphere. Its width is a sensitive diagnostic of the ionization balance between neutral and singly ionized magnesium, which determines the opacity scale (and formation height) of other diagnostically important MgI lines like the 457.1 nm intercombination line, the magnesium b lines and the infrared MgI emission lines near 12 microns. Analysis of the observed line profiles shows that it is necessary to include the effects of partial frequency redistribution (PRD) in the formation of the line as in the case of the h&k lines. This implies that the core of the line is very sensitive to the way scattering is treated in the modeling of the line, and in turn this allows us to separate the uncertain effects in the atomic data (viz. the Van der Waals broadening) from the uncertainties in the underlying atmospheric model. The main objective of this research was to compare observed spectra of the magnesium resonance lines against theoretical line profiles calculated from recent models of the solar atmosphere by Fontenla et al., hereafter called FAL. These models extend earlier solar models by Avrett et al. and provide yet a better match between observed and calculated spectra, in particular of the hydrogen Lyman line, by including the effects of ambipolar diffusion of hydrogen and helium in the mass and energy transport equations for the chromosphere-corona transition region. Although the transition region models can be built self-consistently (without additional observational input) once the proper boundary conditions are given at the top of the chromosphere, there are uncertainties in the models precisely because these boundary conditions are not well known. With the analysis of UVSP magnesium observations we strive to constrain these uncertainties. Author

KAMIOKANDE RESULTS ON SOLAR NEUTRINOS AND A SUPERNOVA SEARCH
Y. Suzuki May 1993 11 p Presented at the International Symposium on Neutrino Astrophysics, Gifu, Japan, 19-22 Oct. 1992 See also A93-44876
(ICRR-Rept-294-93-6; JTN-94-80540) Avail: CASI HC A03/MF A01

The solar neutrino measurement extended till the end of August in 1992 gives almost entire coverage of the solar maximum in solar cycle 22. The observation shows the almost constant solar B-8-neutrino flux of Data/SSM (Standard Solar Model) = 0.49 +/- 0.04 +/- 0.06 on an average for the Kamiokande 2 and 3 data. The flux limit of the Hep neutrino is shown at first time. A stringent limit on solar anti-neutrinos that is less than 5.8 percent of the flux of B-8 neutrinos is obtained. A search for supernova neutrinos in the Kamiokande detector is briefly summarized and galactic supernova rate obtained is less than 0.54 SN (Supernova)/year for 4.26 years of observation. Author (NASDA)

SOLAR NEUTRINOS: REAL-TIME EXPERIMENTS
Yoji Totsuka Apr. 1993 21 p
(ICRR-Rept-293-93-5; JTN-94-80542) Avail: CASI HC A03/MF A01

This report outlines the principle of real-time solar neutrino detection experiments by detecting electrons with suitable target material, via Charged-Current (CC) reaction using conventional counting techniques developed in high-energy physics. Only B-8 neutrinos can be detected by minimum detectable energy of several MeV. The MSW (Mikheyev, Smirnov, Wolfenstein) effect not only distorts the energy spectrum but also induces new type of neutrinos, i.e. mu-neutrinos or tau-neutrinos. These neutrinos do not participate in the CC reaction. Therefore real-time experiment is to be sensitive to Neutral Current (NC) reactions. It is a challenge to eliminate environment background as much as possible and to lower the minimum detectable energy to several 100 keV, which will enable observation of Be-7 neutrinos. Target particles of real-time experiments currently running and under construction or planning are electron, deuteron, or argon. The relevant reactions corresponding to CC reaction and some relevant comments on the following targets are described: (1) electron target; (2) deuteron target; and (3) argon target. On-going experiment and future experiments for real-time neutron detection are also outlined. Author (NASDA)

SOLAR FLARES AND MAGNETOSPHERIC PARTICLES: INVESTIGATIONS BASED UPON THE ONR-602 AND ONR-604 EXPERIMENTS Quarterly Report No. 4
John P. Wefel and T. G. Guzik 30 Nov. 1993 23 p Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(Contract N00014-90-J-1466)
(AD-A273639) Avail: CASI HC A03

This performance report covers work accomplished under ONR Grant N00014-90-J-1466 related to the radiation environment in near-earth space. The goal of the research is to measure and describe, quantitatively, the geospace radiation environment in which men and spacecraft must survive and function. The tools for this investigation are the data returned by the ONR-602 and ONR-604 experiments, both flown under the auspices of ONR and the Air Force Space Test Program, augmented by correlative databases of both space-based and ground-based data. The investigation involves data analysis, modeling, and applications to a variety of space equipment and environments. This report builds upon the detailed technical report and the previous performance reports. For the current period, the principal effort was in modeling of the anomalous component, determining the modulation level during the CRRES mission, and studying the quiet-time particle access to the magnetosphere. ON THE PHYSICS OF WAVES IN THE SOLAR ATMOSPHERE: WAVE HEATING AND WIND ACCELERATION Semiannual Report, period ending Mar. 1994
Z. E. Musielak Mar. 1994 7 p
(Grant NAG8-839)
(NASA-CR-195197; NAS 1.26:195197) Avail: CASI HC A02/MF A01

This paper presents work performed on the generation and physics of acoustic waves in the solar atmosphere. The investigators have incorporated spatial and temporal turbulent energy spectra in a newly corrected version of the Lighthill-Stein theory of acoustic wave generation in order to calculate the acoustic wave energy fluxes generated in the solar convective zone. The investigators have also revised and improved the treatment of the generation of magnetic flux tube waves, which can carry energy along the tubes far away from the region of their origin, and have calculated the tube wave energy fluxes for the sun. They also examine the transfer of the wave energy originated in the solar convective zone to the outer atmospheric layers through computation of wave propagation and dissipation in highly nonhomogeneous solar atmosphere. These waves may efficiently heat the solar atmosphere and the heating will be especially significant in the chromospheric network. It is also shown that the role played by Alfven waves in solar wind acceleration and coronal hole heating is dominant. The second part of the project concerned investigation of wave propagation in highly inhomogeneous stellar atmospheres using an approach based on an analytic tool developed by Musielak, Fontenla, and Moore. In addition, a new technique based on Dirac equations has been developed to investigate coupling between different MHD waves propagating in stratified stellar atmospheres. CASI

SOLAR MAGNETIC CYCLE

Karen L. Harvey 1993 17 p
(Contract NASw-4721)
(NASA-CR-195202; NAS 1.26:195202) Avail: CASI HC A03/MF A01

Using NSO/KP magnetograms, the pattern and rate of the emergence of magnetic flux and the development of the large-scale patterns of unipolar fields are considered in terms of the solar magnetic cycle. Magnetic flux emerges in active regions at an average rate of 2 x 10(exp 21) Mx/day, approximately 10 times the estimated rate in ephemeral regions. Observations are presented that demonstrate that the large-scale unipolar fields originate in active regions and activity nests. For cycle 21, the net contribution of ephemeral regions to the axial dipole moment of the Sun is positive, and is of opposite sign to that of active regions. Its amplitude is smaller by a factor of 6, assuming an average lifetime of ephemeral regions of 8 hours. Active regions larger than 4500 Mm(sup 2) are the primary contributor to the cycle variation of Sun's axial dipole moment. Author (revised)

TWO POPULATIONS AND MODELS OF GAMMA RAY BURSTS
J. I. Katz 20 Jul. 1993 19 p Repr. from The Astrophysical Journal, v. 422, no. 49, 10 Feb. 1994
(Grant NAGw-2918)
(NASA-CR-194762; NAS 1.26:194762) Avail: CASI HC A03/MF A01

Gamma-ray burst statistics are best explained by a source population at cosmological distances, while spectroscopy and intensity histories of some individual bursts imply an origin on Galactic neutron stars. To resolve this inconsistency I suggest the presence of two populations, one at cosmological distances and the other Galactic. I build on ideas of Shemi and Piran (1990) and of Rees and Mesozaros (1992) involving the interaction of fireball debris with surrounding clouds to explain the observed intensity histories in bursts at cosmological distances. The distances to the Galactic population are undetermined because they are too few to affect the statistics of intensity and direction; I explain them as resulting from magnetic reconnection in neutron star magnetospheres. An appendix describes the late evolution of the debris as a relativistic blast wave. Author

TO PERFORM A PROOF-OF-CONCEPT STUDY ON THE USE OF SUPERHEATED DROP DETECTORS FOR THE MEASUREMENT OF LET SPECTRA IN SPACE ENVIRONMENTS Final Report
R. A. Noulty, S. Hoffman, M. L. Larabie, J. L. Jevcak, B. Campbell, T. Clifford, T. McLean, and H. Ing 1992 92 p
(Contract W7714-0-9393/01-ST)
(BTI-92/3-31; CTN-94-60900) Avail: Micromedia Ltd., Technical Information Centre, 165 Hotel de Ville, Place du Portage, Phase 2, Hull, Quebec J8X 3X2, Canada

Research was conducted with the ultimate aim of developing a linear energy transfer (LET) spectrometer suitable for measurement of space radiation, in order to quantify the effect of cosmic rays on electronic components. For measuring the LET spectrum sensed by electronic components, the technical problem is the low penetration of many extraterrestrial radiations of interest. The chosen approach to this problem involves encapsulating individual droplets of the medium that forms the sensitive sites of the bubble detectors. In the research, fluorinated compounds suitable for micro-encapsulation were determined along with the various polymers useful for encapsulating those compounds. Encapsulation processes including complex coacervation, interfacial polymerization, spray drying, and suspension polymerization were evaluated. The capabilities of the capsules to detect neutrons and heavy ions were tested. Thin layer detectors were also fabricated and tested. The results indicate that it is possible to surround a superheated freon droplet with an amount of material thin enough to allow penetration of a heavy ion, and that thin-bubble detectors are capable of detecting He-4 ions and neutrons. Problems with excess drying in vacuum and lowering of effective superheat still have to be overcome. CISTI

NEUTRON STAR MERGERS AND GAMMA-RAY BURSTS Final Technical Report, period ending 31 Dec. 1993
Ramesh Narayan 1993 6 p
(Grant NAG5-1904)
(NASA-CR-195176; NAS 1.26:195176) Avail: CASI HC A02/MF A01

Under the support of grant NAG 5-1904, we have carried out research on several topics related to gamma-ray bursts (GRB's). In our proposal, we stated that we would study three topics: (1) fireball evolution; (2) neutron star mergers; and (3) statistics of bursts. We have completed a significant amount of work in each of these areas. Resulting papers from this work are presented. Author (revised)

[AN ANALYSIS OF GAMMA RAY BURST TIME HISTORIES] Final Report
John Patrick Lestrade and Gerald R. Karr Feb. 1994 4 p Presented at the Summer Faculty Fellowship Research Continuation Program, Huntsville, AL, Feb. 1994; sponsored by Alabama Univ.
(Grant NAG8-212)
(NASA-CR-195191; NAS 1.26:195191; UAH-5-30166) Avail: CASI HC A01/MF A01

Gamma ray burst time histories, ranging in durations from milliseconds to thousands of seconds, are as varied as the number of bursts. They show a wide array of structures from those that are very smooth to those that contain a seemingly uncountable number of spikes riding on top of other spikes. These profiles have tantalized researchers for years - they obviously hold important information on the nature of GRB's, but to date no one has been successful in analyzing them. For the past year the author has been working on algorithms to analyze these data. Two approaches have been followed in this investigation. The first is an attempt to quantify the amount of structure, or spikiness, in a profile. The second involves applying the latest theorems on chaos and fractals with the aim of extracting useful information from what seems to be a random collection of shot noise. Author (revised)

THE SOLAR SPECTRAL IRRADIANCES FROM X RAY TO RADIO WAVELENGTHS
O. R. White 1993 9 p
(Contract NASw-4721)
(NASA-CR-195203; NAS 1.26:195203) Avail: CASI HC A02/MF A01

Sources of new measurements of the solar EUV, UV, and visible spectrum are presented together with discussion of formation of the solar spectrum as a problem in stellar atmospheres. Agreement between the data and a modern synthetic spectrum shows that observed radiative variability is a minor perturbation on a photosphere in radiative equilibrium and local thermodynamic equilibrium (LTE). Newly observed solar variability in 1992 defines a magnetic episode on the Sun closely associated with changes in both spectral irradiances and the total irradiance. This episode offers the opportunity to track the relationship between radiation and magnetic flux evolution. Author

SUPERCONDUCTING COSMIC STRINGS NEAR THE ELECTROWEAK SCALE AND COSMIC-RAY PROPAGATION
R. Plaga Feb. 1993 10 p Submitted for publication Limited Reproducibility: More than 20% of this document may be affected by microfiche quality
(MPI-PhE/93-05; ETN-94-95115) Copyright Avail: CASI HC A02

A method to search for superconducting cosmic strings with a symmetry breaking mass scale near the electroweak scale from experimental data is described. Strings in the galaxy act as scattering centers because of their coherent and bounded magnetic field. In this case they contribute to the diffusion of galactic cosmic rays. The rigidity dependence of the string induced diffusion coefficient is very specific. The search for superconducting strings can be performed by studying the diffusion properties of low energy galactic cosmic rays. Particle emission by galactic strings near the electroweak scale is discussed. Gamma ray emission from galactic strings near the electroweak scale have not been detected up to now. Further experiments are required. ESA

The NASA Lewis Research Center (LeRC) defines and develops advanced technology for high priority national needs. The work of the Center is directed toward new propulsion, power, and communications technologies for application to aeronautics and space, so that U.S. leadership in these areas is ensured. The end product is knowledge, usually in a report, that is made fully available to potential users--the aircraft engine industry, the energy industry, the automotive industry, the space industry, and other NASA centers. In addition to offices and laboratories for almost every kind of physical research in such fields as fluid mechanics, physics, materials, fuels, combustion, thermodynamics, lubrication, heat transfer, and electronics, LeRC has a variety of engineering test cells for experiments with components such as compressors, pumps, conductors, turbines, nozzles, and controls. A number of large facilities can simulate the operating environment for a complete system: altitude chambers for aircraft engines; large supersonic wind tunnels for advanced airframes and propulsion systems; space simulation chambers for electric rockets or spacecraft; and a 420-foot-deep zero-gravity facility for microgravity experiments. Some problems are amenable to detection and solution only in the complete system and at essentially full scale. By combining basic research in pertinent disciplines and generic technologies with applied research on components and complete systems, LeRC has become one of the most productive centers in its field in the world. This brochure describes a number of the facilities that provide LeRC with its exceptional capabilities. Author (revised)

In this book, part diary and recollection, T. Keith Glennan--the first administrator of NASA--relates the story of how he and others both inside and outside of the agency worked within the circumstances created by the Sputnik crisis to plan and organize a viable space program that ultimately put 12 Americans on the Moon. In the process, Glennan also reveals a great deal about Eisenhower as a human. Derived from text

SOLAR-TERRESTRIAL ENVIRONMENTAL LABORATORY Annual Report, 1 Apr. 1992 - 31 Mar. 1993
31 Mar. 1993 33 p Original contains color illustrations
Avail: CASI HC A03/MF A01

The Solar-Terrestrial Environment (STE) Laboratory was established in June 1990 as one of the research institutes attached to Nagoya University for promoting cooperative research on the solar-terrestrial environment. The former Research Institute of Atmospherics and the Cosmic-Ray Research Laboratory, School of Science, were merged to create the new laboratory. Several cooperative projects under the Solar Terrestrial Energy Program (STEP), International Global Atmospheric Chemistry (IGBP) program, and a domestic research program on the global environment were set up at approximately the same time as the start of the STE Laboratory. These research projects aim at understanding solar-terrestrial environment changes relevant to the objective of our institute. We have participated in these programs, carrying out several observations in collaboration with other institutions. Most of the observations have been carried out as international cooperative research projects, not only at the observation sites of the STE Laboratory in Japan, but also at 25 other observation points situated in the United States, Canada, Russia, Australia, New Zealand, France, Norway, Sweden, Indonesia, Papua New Guinea, Peru, Bolivia, and Brazil. These observations continuously monitor geomagnetic variations, ULF and VLF waves, auroras, minor atmospheric constituents, aerosols, solar wind, solar neutrons and cosmic rays. It is important to embark on research programs which have long-term prospects and international cooperation to increase our understanding of the global aspect of the solar-terrestrial environment. At present, we have agreements with 14 foreign institutions, to develop academic exchange and cooperation in the field of solar-terrestrial studies. Observations from the Raman scattering lidar, installed in 1991, started in July, 1993. This sophisticated lidar system is used for monitoring aerosols and some gaseous components, such as H2O and CO2 and will be open to use for collaborative research work. Construction of a new UHF antenna was completed at Agematsu, Nagano, to make up a four-antenna system for the measurement of solar wind plasmas by using the interplanetary scintillation method. The new antenna will not only improve the capability of solar wind observations in the vicinity of the sun, but also make it possible to measure random velocities which are expected to impart additional acceleration to the solar wind. To promote collaborative research activity in the field of solar-terrestrial environmental science, efforts were made to establish an on-line connection between the STE Laboratory and other institutions. A new network system, STEnet, in the laboratory is connected to the Japanese inter-university network known as N1 and the Internet via TISN (Total International Science Network), which supports both NSI/DECnet (SPAN) and Academic Internet. N94-23572# Office of Technology Assessment, Washington, DC.
CONTRIBUTIONS OF DOE WEAPONS LABS AND NIST TO SEMICONDUTOR TECHNOLOGY
Avtar S. Oberai and Elizabeth Sheley, ed. Sep. 1993 91 p
(OTA-ITE-585; ISBN-0-16-042095-4) Avail: CASI HC A05/MF A01; SOD HC

The debate over whether and how to expand the missions of the DOE labs has raised questions of how to coordinate these new activities with those of labs and agencies that already have responsibility for civilian technology policy - principally the National Institute of Standards and Technology of the Department of Commerce. NIST has emerged in the last few years as one of the federal government's major players in civilian technology advancement through, for example, management of the new and well-regarded Advanced Technology Program. This Report examines how NIST and DOE weapons laboratories could contribute to advances in semiconductor technology aimed specifically at civilian applications. Semiconductor technology was chosen as an example of a technology focus for a civilian technology initiative, primarily because the industry had already developed a set of comprehensive technology road maps and the federal labs had substantial expertise in the area. The Report was requested as a follow-on assessment to OTA's work on the implications for the U.S. civilian economy at the end of the Cold War. That work consists of two reports: After the Cold War: Living With Lower Defense Spending, and Defense Conversion: Redirecting R&D. The former considered the effects on defense workers, defense-dependent communities, and defense companies, and suggested policy options to ease transitions for those affected by cutbacks. The latter examined how the R&D institutions whose primary missions were defense-related could contribute to national well-being under a broader concept of national security. Author (revised)
